During the investigations occasioned by the trial of Mr Reign of Hastings, and the discussion of India affairs, the opposi-George III. tion were led to bring forward a series of charges, importing high crimes and misdemeanours, against Sir Elijah Impey, formerly chief justice of the supreme court of Bengal. The substance of these charges, six in number, and which were presented to the House of Commons by Sir Gilbert Elliot, was, that the chief justice had in a variety of instances rendered himself the agent and tool of Mr Hastings, particularly in the decision of a considerable number of important causes. Sir Gilbert stated that Sir Elijah Impey had been declared criminal by parliament, before the parties into which it was at present divided had any existence; and that the proceedings out of which this accusation arose had been carried on by persons of all connections, and countenanced by the different administrations which had succeeded each other during the last six years. He contended that the only means left of reforming Indian abuses, was the punishment, in some great and signal instances, of Indian delinquency; and this proposition he endeavoured to establish by comparing the different force and efficacy of laws, arising from their penal sanctions, when applied in our own internal administration, and in the government of distant possessions. Of the particular charges brought against Sir Elijah Impey, that respecting the fate of Nundcomar, a Hindu prince of the sacred caste of the Brahmins, was the most remarkable. This man having had the weakness or imprudence to lodge an information, or rather accusation, with the East India Company, against their principal servant, Mr pacious, and endeavoured to hold him up to execration as Hastings, the governor-general, it was alleged, had procured an accusation to be brought against him, in the court where Sir Elijah Impey presided; and Nundcomar having been tried for forgery on an English statute, was condemned and executed. In the course of the session,

witnesses were examined against Sir Elijah Impey; and

his defence was undertaken by the chancellor of the exchequer, and the solicitor and attorney-general. On the

9th of May the first charge was rejected by a small ma-

jority; and on the 27th the house voted a delay of proce-

dure during three months. This saved the accused, and

no impeachment resulted from the inquiry.

During the interval which followed the prorogation of parliament, the only occurrence worthy of notice arose out of the contests of the northern nations. At this period the relative condition of the European powers had undergone a very important change. During a century and a half the power of the monarchy of France had been formidable to all Europe; and, at different periods, the most extensive combinations had been found necessary to resist its ambition. But since the termination of the American war, that monarchy had evidently lost much of its importance among the neighbouring nations. Its influence over Holland had ever been one of its favourite objects of pursuit; but during the preceding year it had suffered that influence to be overturned without a struggle; and, as far as regarded any external effort, France appeared at this time to have fallen into a state of complete imbecility. The powers whose ambition had now become dangerous to the repose of Europe, were Austria and Russia. The latter, in particular, proved extremely restless and enter-prising. The empress Catherine II. had contrived to engage in her views the emperor Joseph II. and had prevailed with him to engage in a sanguinary contest on the eastern frontiers of Europe, with a view to the partition of the provinces of Turkey; whilst France, the ancient ally of that power, was unable to afford it any countenance or aid.

In the mean time Catherine held in a state of dependence approaching to subjection the kingdoms of Sweden and Denmark. After the reign of Charles XII. whose

George III. sources of the country, Sweden sunk into a state of political weakness. The nobles had resumed the independence of the feudal times; the anarchy to which that form of government is so remarkably subject had returned; the crown and the people were equally insignificant; and the mutual animosities of the nobles exposed the state to the intrigues of neighbouring nations. In their diet there was a French party and a Russian party, but there was not an individual among them who supported the party of Sweden. Gustavus III., however, was now in the vigour of his age, and a man of an enthusiastic and enterprising character. By attaching to himself the peasantry of the country and their deputies in the diet, he had, in 1772, re-established absolute power; but the nobles having gradually recovered a portion of their authority, and having been aided by the intrigues of Russia, had now become dangerous to the throne. This rendered the situation of the Swedish monarch extremely uncomfortable, and, exciting in his mind a desire of shaking off all dependence upon Russia, he resolved to take advantage of the war, in which she was actually engaged with the Turks, in order to make an attack on her north-western frontier. To accomplish this object, however, it was necessary that Sweden should be safe on the side of Denmark. But that power had already contracted engagements with Russia; and Gustavus having, it is said, afforded countenance and encouragement to the malcontents of Norway in 1772, this circumstance has been alleged by the Danes as an excuse for the treaty into which their government secretly entered, and by which it was agreed that, if Russia were attacked, Dehmark would assist her with twelve thousand auxiliary troops and six ships of the line. But whatever may have been the conduct of the king of Sweden in 1772, he now endeavoured in the most anxious manner to conciliate the good will of Denmark, and at the close of the year 1787 paid an unexpected visit to the Danish court at Copenhagen, where he endeavoured by every argument to prevail with the prince regent and his council to enter into his views regarding Russia. But the court of Denmark could not be induced to countenance his schemes, and appears to have concealed its secret engagements with Russia, as well as the part which it meant to take in the event of a war between Russia and Sweden.

In the month of July the king of Sweden commenced offensive operations on the side of Finland. But the discontents which had been fostered by Russia among the Swedish nobles soon broke out; several officers declared sent of the states of the kingdom; and the troops refused to advance. Whilst the king was in this embarrassed situation, a Danish army suddenly advanced against Sweden under Prince Charles of Hesse-Cassel, accompanied by the prince of Denmark as a volunteer; and to give this force The affairs of Sweden were now all but desperate. During states of the kingdom; but Gustavus unexpectedly arrived at Stockholm from Finland, put an end to their pro-

Reign of extravagant military enterprises had exhausted the re- king next hastened to the province of Dalecarlia, inhabit- Reign of ed by a fierce and ignorant but honest people, celebrated George III. for the share which they had in the revolution by which Gustavus Vasa rescued his country from the despotism and cruelty of Denmark, which had massacred the citizens of Stockholm, and almost exterminated the nobility of the kingdom; and the loyalty of these people being kindled to enthusiasm by this visit of the king to their mines and forests, four thousand of them instantly came forth as volunteers. In the mean time the Danish army, proceeding along the sea coast, which had been left undefended, took a body of Swedes prisoners, and advanced towards Gottenburg, which being mostly built of timber, was liable to instant destruction by bombardment. The place had actually been summoned, when the king, by unusual personal exertion, passed at the critical period unnoticed through the enemy's parties, and entered the city. His presence had the effect of restoring the confidence of the inhabitants, who resolved to encounter every hazard in defence of the city; but the place was thus saved only for a moment, and its situation, as well as that of the king himself, was still extremely perilous. On this occasion, however, the city, the king, and perhaps the monarchy of Sweden, owed their safety to the interference of a British subject, Mr Hugh Elliot, the British envoy at Copenhagen. From the first notice of hostilities, this gentleman, discerning the interests of his country and of Europe, passed over into Sweden, and offered his mediation to the king, at the same time that he threatened the Danes with an immediate invasion by a Prussian army, supported by a British and Dutch fleet. The Danish commander became intimidated, and delayed his threatened hostilities; a Prussian envoy soon arrived, and confirmed all the menaces of Mr Elliot; and the consequence was, that after much negociation, a suspension of hostilities was concluded, and in the month of November the Danish troops evacuated the territory of Sweden.

At the close of autumn this year a domestic event of a singular nature, and new in the British history, occurred. The health of the sovereign had suffered, not from freedom of indulgence and excess of luxury, but from too severe a regimen, too laborious exercise, too rigid abstemiousness, and too short intervals of rest. As a remedy for the symptoms which manifested themselves, he was advised to resort to the medicinal waters of Cheltenham, and accordingly repaired thither immediately after the prorogation of parliament, and did not return to the metropolis till the 18th of August. But no material benefit had rethat the king had no right to make war without the con- sulted from this excursion. His health continued in a precarious state; and on the 22d of October symptoms were observed by one of the royal physicians, of that alienation of mind which was afterwards the occasion of so many important and interesting transactions. For some time it was thought proper to observe the utmost secrecy respectthe appearance of an auxiliary army, the prince of Hesse ing the nature of the king's indisposition; and the retreat had been created a field-marshal in the Russian service. of the sovereign at Windsor was favourable for this purpose. For several days an opinion was entertained that the king's absence the senate of Stockholm had assumed his indisposition arose from fever, and that it had attained extraordinary powers, and summoned a meeting of the so alarming a height as to threaten speedy dissolution; but the real nature of the malady could not long be suppressed. By the law and practice of the English consticeedings, instantly sent off the whole regular troops from tution, almost every species of public business is, in some the capital, and having assembled the citizens, declared manner, connected with the exercise of the royal prerothat he intrusted to their fidelity the defence of his capi- gative. The administration of the general government, tal, and the protection of the queen and the royal family. in particular, was by this event virtually suspended; and His audience were seized with a military enthusiasm; the notwithstanding the critical situation of Europe, and the citizens armed and embodied themselves, and performed very active share which we had taken in its concerns, it the whole duty of the garrison; while such of the officers was now deemed impracticable to return any sort of anas had returned from the army in Finland were insulted swer to the dispatches of foreign courts, or even to those as traitors, and compelled to conceal themselves. The of our own ambassadors. In this situation the most natu-

Reign of ral expedient was to suffer the two houses of parliament, George III which stood prorogued to the 20th of November, to assemble at that time, and either to adjourn for a short interval, or proceed immediately to discuss the measures which it would be proper to adopt at such a juncture. Circular letters were accordingly addressed to the members of the legislature on the 14th, signifying that the indisposition of the sovereign rendered it doubtful whether there would be a possibility of receiving his commands for the further prorogation of parliament; that in such a case the two houses must of necessity assemble; and that a numerous attendance of the members was extremely desirable.

When parliament assembled, the lord chancellor observed in the House of Lords, that the reason of their being thus unusually called together without the ordinary notice, for the dispatch of business, arose from the severity of the king's indisposition, which had rendered it impossible for him to approach the royal person in order to receive his commands. Lord Camden remarked, that the customary practice of giving forty days' notice previous to the meeting of parliament, was not in his opinion absolutely necessary; that there was an express act of parliament, which limited the notice, in case of treason or rebellion, to fourteen days; that he would therefore recommend an adjournment for that term; and that the chancellor should, by order of the house, address an official letter to every individual peer. In the House of Commons Mr Pitt stated that every authority had been consulted respecting the present singular situation of affairs; that none pointed out either the possibility of directing a new prorogation, or of enabling ministers to open the session of parliament in any regular way; that, under these circumstances, it would be improper for the house to proceed to the discussion of any public business; and that it was absolutely necessary to adjourn. He therefore recommended the interval of a fortnight, when, if the king's illness should unhappily continue, it would be indispensably incumbent upon them to enter upon the immediate consideration of the state of public affairs; and he further moved a call of the house for the 4th of December, and that the speaker should be directed to send circular letters, requiring the attendance of every member on that day.

The tenor of the precedents afforded by the history of regency, under which the whole, or a considerable part of the power of the state, should be confided to the next heir to the crown, or to the adult of the royal family most nearly related to the king; and what rendered this consideration the more material upon the present occasion was, that the Prince of Wales was understood to entertain an avowed partiality for the political connection which had lately been instrumental in obtaining for him the discharge of his debts and an increase of his annual income, as well as some personal resentment against the ministers now in possession of office. Accordingly, soon after the indisposition of the king had been ascertained, the prince dispatched an express to Mr Fox, who was at that time in Italy, requesting his immediate presence to assist him in forming an administration. The ministers were also aware of the intentions of the Prince of Wales, and wished, if possible, to retain possession of office. Besides, as the duration of the king's illness was necessarily uncertain, and he might speedily be able to resume the reins of government, it was obviously their interest to procrastinate as long as possible; and they were enabled to do so in consequence of the tranquil state of the nation, which rendered the exercise of the executive power of less immediate necessity than in times of war or public alarm. The effect of mere reputation in supporting any political measure was remarkably illustrated on this occasion. Mr Pitt and it, especially as their side of the question was likely to be

his colleagues in office were in possession of the public fa- Reign of vour in a degree in which perhaps no ministers had ever George III. before enjoyed it for so long a period of time. To Mr Fox and his associates still attached part of the odium which the coalition and the Indian bill had originally excited. The Prince of Wales himself was even less popular. The sobriety of his father's life formed a contrast to his youthful indiscretions; and the rumour of his marriage with Mrs Fitzherbert was still propagated, and met with credit. In this state of affairs the king's ministers, who had ceased to be any thing more than ministers by courtesy, had every advantage in their project of delaying as long as possible the relinquishment of their official situations, by placing the exercise of the royal authority in new hands. Mr Pitt likewise conducted himself with great dexterity in contriving subjects of discussion in the House of Commons; whilst his antagonists, in contending against him for victory upon speculative political questions, seem not to have been aware that they were in fact fighting his battle, by delaying the period of their own entrance into power.

Upon the re-assembling of parliament on the 4th of December, a report of the privy council, containing an examination of the royal physicians, was presented to the two houses by Lord Camden and Mr Pitt; and it was suggested, that when the delicacy of the subject and the dignity of the person in question were considered, parliament would probably perceive the propriety of acting upon this report, rather than of demanding that more direct and ample information to which, in strictness, they were entitled. This suggestion seemed reasonable, as it could scarcely be supposed that the ministers of the crown would act so directly in opposition to their own interests, as falsely to represent their master as incapacitated by mental disease for the exercise of his royal functions. Mr Fox, Mr Burke, and others, however, would not take any assurance upon this point, but insisted on the solemnity of an inquiry by a committee of the two houses. This was accordingly agreed to, and the report of the committee was laid upon the table of the House of Commons on the 10th, when a further proposition was moved by Mr Pitt for the appointment of a committee to examine precedents respecting those cases in which the personal exercise of the royal authority had been prevented or England was regarded upon the whole as in favour of a interrupted by infancy, sickness, infirmity, or any other cause. Mr Fox observed, that though he had no objection to the appointment of a committee for the purpose proposed, yet as it was notorious that no precedent existed which could be applied to the present case, he took the opportunity of stating as a general principle, that the king being at present incapable of holding the executive government, the Prince of Wales had as clear and express a right to assume the reins and exercise the power of sovereignty during the continuance of the present incapacity, as if his father were actually dead; but he added, that though the prince's right was perfect and entire, the two houses of parliament, as the organs of the nation, were alone qualified to pronounce when he ought to take possession of his right. In reply to this observation, Mr Pitt stated, that for any man to assert such a right in the Prince of Wales, otherwise than as it was voluntarily conferred upon him by the two houses of parliament, was little less than treason against the constitution; and that, except by their election, he had no more right, in point of principle, to assume the government, than any other subject in England.

On the following day the opinion which had been stated by Mr Fox was attacked in the House of Lords by Lord Camden, and defended by Lord Loughborough and Lord Stormont. Ministers had now got an abstract question as a subject of debate, and they resolved not to lose sight of

Reign of most popular, from being founded on an assertion of the hereafter be open to the wisdom of parliament to reconsi-George III. powers of parliament in opposition to hereditary right. Accordingly, when the subject was next mentioned, Mr Pitt said, that the question which had been started respecting the rights of parliament was of much greater magnitude and importance than those which related to the present exigency; and that it was impossible to dismiss the question of right without its being fully discussed and decided. And on the 16th of December, in a committee upon the state of the nation, he entered at large into the subject, and endeavoured to prove by ancient precedents that the powers vested in a regent had always been inferior to those of the king, and that parliament had interfered in cases of royal infancy in appointing councils of regency, nay even a single regent or protector; but he at the same time admitted that it would be expedient to intrust the government to the Prince of Wales, whatever limitations it might be thought necessary to impose on him. Mr Fox, on the contrary, contended that his doctrine was supported by the very nature of a hereditary monarchy. Upon Mr Pitt's principles, said he, if a man were questioned whether the monarchy is hereditary or not, the answer must be, I cannot tell; ask his majesty's physicians. When the king of England is in health the monarchy is hereditary, but when he is ill and incapable of exercising the sovereign authority, it is then elective. He ridiculed the absurdity of Mr Pitt's assertion, that the Prince of Wales had no more right than any subject of the realm, while he at the same time confessed that parliament was not at liberty to think of any other regent. But Mr Pitt's motion on the question of right was carried by a considerable majority.

On the 22d of December Mr Pitt proposed in the House of Commons, a resolution, the object of which was to declare it necessary, for the purpose of supplying the present deficiency, and maintaining entire the constitutional authority of the king, that the two houses should determine on the means by which the royal assent might be given to the bill which they might adopt for constituting a regency. The object of this proposition was obvious. Administration had resolved not to confide the regency to the Prince of Wales except under certain restrictions; but without the royal assent, an act of parliament, fixing these restrictions, could not be passed. They wished, therefore, to devise a solemnity which, in this case, might be held as equivalent to the royal assent; and Mr Pitt proposed, that the great seal should be affixed by the lord chancellor to the act of parliament, and that this should be held as equivalent to the royal assent. Mr Fox, on the contrary, urged an immediate address to the Prince of Wales, requesting him to take upon himself the regency; and upon the point long debates occurred in both houses of parliament, in which administration continued to be supported by the majority.

In the meanwhile Mr Pitt, in the name of the rest of the cabinet, explained to the Prince of Wales, in a letter, the restrictions which were meant to be inserted in the regency bill. These were, that the care of the king's person, and the disposal of his household, should be committed to the queen; and that the power to be exercised by the prince should not extend to the personal property of his father, nor to the granting of any office, reversion, or pension, except where the law absolutely required it, as in the case of the judges, for any other term than during the king's pleasure, nor to the conferring of any peerage, unless upon such persons of the royal issue as should have attained the age of twenty-one years. It was added, that these ideas were founded upon the supposition that the royal malady would only be temporary, and might be of short duration; that it was difficult to fix at present the precise period for which these provisions ought to endure; but that it would

der them whenever circumstances might appear to render George IIL it eligible. In his answer, which was dated on the second of January 1789, the prince declared, that it was with deep regret he perceived, in the propositions of administration, a project for introducing weakness, disorder, and insecurity, into every branch of public business; for dividing the royal family from each other; for separating the court from the state, and depriving government of its natural and accustomed support; for disconnecting the authority to command service from the power of animating it by reward; and for allotting to him all the invidious duties of the kingly station, without the means of softening them to the public by any one act of grace, favour, or benignity. He stated it as a principle of the British constitution, that the powers and prerogatives of the crown were held in trust for the benefit of the people, and were sacred as conducing to preserve that balance of the constitution which formed the best security for the liberty of the subject; and he objected to making trial in his person, of an experiment to ascertain with how small a portion of kingly power the executive government of the country could be conducted. He stated his conviction, that no event could be more repugnant to the feelings of his royal father on his recovery, than to know that the government of his son and representative had exhibited the sovereign power in a state of degradation and diminished energy, injurious in its practice to the prosperity of the people, and mischievous in its precedent to the security of the monarch and the rights of his family; but he nevertheless declared himself resolved to undertake, under every disadvantage, the office of regent, in order to avoid the evils which might arise from his following a different line of conduct.

The most singular part of this project for the government of the kingdom appears to have been that for confiding to the queen the power of removing, nominating, and appointing the officers of the royal household; assisted by a permanent council, to be selected by parliament, and to consist, in some measure, of the members of administration. The annual income of the royal household was computed at L.300,000, and the number of officers of which it consisted amounted to four hundred; an influence which would certainly have been sufficiently formidable to a government in other respects restricted and limited. The lords of the bed-chamber had been made use of to defeat Mr Fox's India bill, and might, under a separate establishment, have proved embarrassing to the existing government. It is obvious, however, that, on this occasion, administration were encouraged in the pursuit of the plan which they had formed for restricting the prince's power, by the addresses presented to them from various parts of the kingdom, expressive of gratitude for the assertion by the House of Commons of their right of providing for the present de-

On the 16th of January Mr Pitt proposed his regency bill, resting it, in some measure, upon the decisive opinion of Dr Willis, who expressed great hopes of the king's recovery; and after long debates, the limitations were sanctioned by a considerable majority. In the House of Lords similar debates occurred, but there also administration proved victorious. On the 31st of January Lord Camden moved in the House of Lords, that the lord chancellor should be directed, by authority of the two houses of parliament, to issue a commission in the name of the sovereign, for the purpose of immediately opening the session of parliament; and this resolution having been carried in both houses, the session was opened in the proposed form on the 3d of February. Though the principles of the regency bill had been previously discussed, yet its various clauses gave rise to new divisions, in which administration still maintained

Reign of their superiority. The bill passed the House of Commons George III. on the 12th of February, and was presented on the following day to the House of Lords, where it was discussed on the 17th and 18th, and a few unimportant amendments

> But here the whole of these proceedings terminated. On the 12th of February, the king having been declared by his physicians to be in a state of progressive amendment, an adjournment of the House of Lords was therefore proposed on the 19th. On the 25th his majesty was declared by his physicians free from complaint; and on the 10th of March the lord chancellor, by the king's authority, addressed both houses of parliament in a speech, after which the ordinary business of the session commenced.

In the meanwhile the administration of Mr Pitt had been less fortunate in Ireland than in this country. The unexampled popularity which reconciled the people of Great Britain to all his measures, and the odium and suspicion which had fallen upon his opponents, had not hitherto been communicated to the neighbouring island. The prospect, therefore, of his departure from office excited little regret in that country, and its parliament made haste to worship what they accounted the rising sun. It had stood adjourned, previous to the royal incapacity, till the 20th January 1789; and the Marquis of Buckingham, then lord-lieutenant, with consent of the privy council of Ireland, ventured to defer its meeting till the 5th of February. On the 11th of that month, two motions were offered to the consideration of the House of Commons, the one by Mr Grattan, the member most distinguished for his talents; and the other by Mr Conolly, the richest of the Irish com-By the first the royal incapacity was declared; and by the second it was proposed to present an address to the Prince of Wales, requesting him to take upon himself the government, with its various powers, jurisdictions, and prerogatives. After a long debate, the propositions of Mr Grattan and Mr Conolly were carried by a large majority; and on the following day an address to the Prince of Wales was also voted, and sent to the House of Lords, where it was adopted by a great majority. On the 19th of February the address was carried to the lord-lieutenant, who, however, refused to transmit it to England; upon which the two houses appointed six commissioners to present the address immediately to the prince: but these measures had scarcely been carried through parliament when the king's recovery rendered them ineffectual, and the consequence was, that the majority of the Irish parliament, who were far from intending to engage in a contest with the British government, found themselves in an awkward situation.

The subject of the slave-trade, which had been brought under the consideration of parliament during the preceding session, was resumed upon the 12th of May. In the interval, petitions against the abolition of the traffic had been presented by persons in London, Liverpool, Bristol, and other places interested in the trade. Meanwhile, the report of the committee of the privy council, of which Mr Pitt had previously given notice, was presented to the House of Commons; and the enemies of the trade had been extremely active in endeavouring to excite the indignation of the public against this odious and inhuman traffic. Innumerable pamphlets were distributed, either gratuitously or at a low price, giving an account of the calamities endured by the unhappy natives of Africa; the wars in which petty princes were tempted to engage, with a view to sell their prisoners to European traders, were fully explained; the wretched manner in which these slaves were transported to the West India colonies, fettered and crowded together so as to occasion the destruction of multitudes by disease, was represented by prints, distributed along

with the popular publications upon the subject, and, last- Reign of ly, instances were given of the cruelty of the masters in George IIL the West Indies, tending to render the white inhabitants extremely odious. By these means the public were led to interest themselves in procuring, if not an abolition of the state of slavery, at least a complete prohibition of the importation of additional slaves from Africa; and to this last object the attention of the legislature was now con-The business was opened by Mr Wilberforce, who stated the effects of the trade upon Africa; noticed the mode of transportation, which he very fully described; adverted to the diseases contracted on ship-board, with the astringents and washes employed to hide the wounds of the miserable sufferers; descanted on the wickedness of the trade, which he felt to be so enormous and irremediable, that he could stop at nothing short of abolition; asserted that the number of negroes in the West Indies might be kept up without the introduction of recruits from Africa; and moved twelve propositions, stating the number of slaves annually carried from Africa, imported into the British West Indies, and entered in the custom-house accounts; the consequences produced upon the inhabitants of Africa; the injury sustained by the British seamen; the fatal circumstances which attended the transportation of the slaves; the causes of the mortality of the negroes, and a calculation of the relative increase of population in Jamaica and Barbadoes; together with a declaration that no considerable or permanent inconvenience would result from discontinuing further importation. Mr Pitt supported that side of the question which had received the sanction of popular approbation; declaring himself satisfied that no argument, compatible with any idea of justice, could be assigned for the continuation of the slave-trade; and expressing a hope, that while Great Britain took the lead of other countries in a matter of so great magnitude, foreign nations would be inclined to share the honour, and contented to unite with us in so excellent a work. Mr Fox highly approved of what had fallen from Mr Pitt, and declared that he had considered the trade in human flesh as so scandalous, that it was in the last degree infamous to suffer it to be openly carried on by the authority of the government of any country. Mr Burke was of opinion that, whatever might be the present situation of Africa, it could never be meliorated under the present system; that while we continued to purchase the natives, they must for ever remain in a state of savage barbarity; that it was impossible to civilize a slave; and that there was no country situated like Africa into which the shadow of improvement had ever been introduced. On the other hand, Mr Wilberforce's propositions met with considerable opposition. Mr Savage and Mr Newnham, on the part of the city of London, asserted, that the measure, if carried into effect, would render the metropolis bankrupt; Mr Dempster thought that Mr Wilberforce's first proposal ought to be, to make good out of the public purse the losses which individuals would sustain from the abolition of the trade; Lord Penrhyn asserted, that as there were mortgages in the West India islands to the amount of seventy millions sterling, Mr Wilberforce's project would subject the country in the repayment of that sum; Mr Henniker opposed the abolition, on account of the alleged depravity of the Africans, which rendered them incapable of civilization; and Lord Maitland, Mr Marsham, Mr Hussey, Mr Rolle, Mr Drake, and Mr Alderman Watson, each alleged something intended to pass as a reason for entertaining similar views. Lastly, the matter ended in the renewal of Sir William Dolben's act to regulate, for a limited time, the mode of conveying slaves in British vessels from the coast of Africa.

The annual business of the budget was not brought for-

Reign of ward this year till the 10th of June; and immediately pre- ment of the revenues of India, which, after deducting Reign of of Commons was vacated by the promotion of Mr Grenville to be one of his majesty's principal secretaries of state. On this occasion Mr Henry Addington, the personal friend of the premier, and son of Dr Stephen Addington, physician to Mr Pitt's family, was appointed to succeed Mr Grenville in the chair. His opponent was Sir Gilbert Elliot, who was proposed by the opposition; and both Mr Fox and Mr Burke animadverted on the youth and inexperience of his competitor; but on a division Mr Addington was elected by a large majority.

The expense incurred by the recent armament, the allowance to the American loyalists, and other circumstances, rendered it necessary to have recourse to a loan of one million, to defray the interest of which additional taxes were imposed upon newspapers, advertisements, cards, and dice, probates of wills, legacies to collateral relations, and carriages and horses. And as one of Mr Pitt's methods of extending the revenue consisted in endeavouring to suppress smuggling, and as he had formerly transferred the management of the duty on wine from the customs to the excise, he now pursued the same course in regard to the article tobacco. The subject was opened in the House of Commons on the 16th of June, when it was observed that tobacco had come to be considered as the staple of the smuggler, in the same manner as tea, wine, and spirits, had formerly been. The quantity of tobacco consumed in the kingdom had been found to bear a tolermillions of pounds; and the loss to the revenue upon the half of this consumption exceeded three hundred thousand pounds per annum. Under these circumstances, Mr Pitt thought it necessary to have recourse to the system of excise, by which the stock of the dealer was taxed, instead of the duty being collected on importation. A bill was accordingly introduced for effecting the transference proposed by the minister, and, after a good deal of discussion, passed by a large majority.

the repeal of the shop-tax, which had proved extremely unpopular in the capital, Mr Pitt at length consented that it should be abolished. Mr Beaufoy again introduced a was supported by Mr Fox, opposed by Lord North and Mr Pitt, and rejected by a narrow majority. A bill introduced into the House of Lords by Earl Stanhope, for relieving members of the church of England from various penalties and disabilities under which they laboured, and for extending freedom in matters of religion to persons of all denominations, Catholics excepted, was equally unsuccessful. The laws it intended to repeal were those which imposed penalties upon persons who did not frequent the established worship; prohibiting men from speaking or writing in derogation of the doctrine of the book of common prayer; enjoining the eating of fish on certain days; authorizing the imprisonment of persons excommunicated prohibiting the exportation of women; and declaring all persons who went to court, without having previously made a certain declaration, to be in the eye of the law Popish recusant convicts. But these absurd and obsolete enactments were stoutly defended by the episcopal bench; and the bill was ultimately rejected.

On the first of July the East India Company petitioned the House of Commons for permission to add a sum of one million to their capital; and the request was granted with little difficulty. On the same day Mr Dundas, as president of the board of control, brought forward a state-

George III. vious to the discussion, the office of speaker of the House every article of expenditure in that country, he calculated George III. at L.1,820,000. During the present session, the trial of Mr Hastings still proceeded before the House of Lords. The third charge brought forward, respecting presents received by him during his government of Bengal, was opened by Mr Burke, who, in the course of his speech, alluded to the trial and execution of Nundcomar, and asserted that Mr Hastings had murdered that man by the hands of Sir Elijah Impey. But as the transaction respecting Nundcomar formed no specific part of the charges which had been preferred against Mr Hastings by the House of Commons, and as the question, in as far as Sir Elijah was implicated, had been examined and rejected during the preceding session, Mr Hastings presented a petition to the house, in which he entreated them, either to cause the additional allegations urged against him to be brought forward, and prosecuted in specific articles, or to afford him such other redress as they might judge suitable and proper. Mr Pitt supported the petition, upon the ground that the murder of Nundcomar formed no part of the crime of peculation, and every rule of evidence was against its being alleged; that it had been charged in order to discredit the character of the accused, although it was a rule in the courts of law that no fact could be given in evidence to discredit even a witness; that if the murder of Nundcomar was not admissible as evidence, it could only be urged as matter of aggravation, which it was impossible to allow; and that the common sense of the ably near proportion to the quantity of tea; and at least house, and of all mankind, would not permit the crime of one half of this quantity was the exclusive commodity of murder to be urged as an aggravation of the crime of pethe smuggler. The consumption amounted to fourteen culation. Mr Fox, on the contrary, cited the case of a culation. Mr Fox, on the contrary, cited the case of a captain of a ship, against whom murder was charged in having thrown his cargo of slaves overboard, in order to prove that he had by sinister means endeavoured to defraud the underwriters of the amount of the insurance; and maintained that the present case exactly corresponded to this. It was impossible to describe the corrupt transactions of Mr Hastings without alluding to the crimes which had accompanied them, or to relate the crimes without mentioning the names of the persons by whom they Mr Fox having annually brought forward a motion for had been committed. A resolution, however, was moved and carried, by which it was declared, that no authority had been given by the House of Commons for making any allegation against Mr Hastings respecting the death of motion for the repeal of the corporation and test acts, which Nundcomar, and that the words of Mr Burke, complained of in the petition, ought not to have been spoken.

The session of parliament was terminated on the 11th of August, by a speech from the lord chancellor in the name of the king. The summer passed away without producing any memorable event, and parliament assembled again on the 1st of January 1790, when they were met by the king in person, who, in the speech from the throne, observed that he continued to receive assurances of a pacific nature from the different powers in Europe, and at the same time congratulated the nation on the happiness it enjoyed, from the increasing advantages of peace.

During the preceding summer the eventful career of the French revolution had commenced. The extreme weakness into which the government of France had fallen, owing to the pressure of the public debts, and the embarrassment of the finances, had induced the king to call together the states general of the kingdom, which soon assumed the title of the national assembly. Their debates, which were held in public, diffused a love of innovation, and a desire to reform their ancient government, and establish a free constitution. The court became alarmed by the violence of their proceedings, and attempted to set bounds to their projects; but the populace of the capital rose in arms, and the military refused to act against them. Meanwhile the national assembly proceeded daily in the discussion of new plans of change. They seized the ecclesiastical property and tithes, resolving to limit the clergy for the future to fixed salaries; they put an end to the monastic institutions; they abolished the whole order of nobility, and limited the power of the crown. These, and other proceedings, which will be stated in their proper place, excited much attention in Britain; and accordingly allusions to them became not unfrequent in parliament during the present session; indeed general questions were debated with more animation, and excited a higher degree of interest, than they had for many years done.

The supplies for the navy and army, which were stated at the same amount as in the preceding session, produced some animadversions from Mr Marsham and Mr Pulteney, who alleged that, in the actual state of Europe, the military establishment of Britain might safely be reduced. Mr Fox observed, that if ever there was a moment in which he could be less jealous than at another of an increase of the standing army, the present was that moment. The example of a neighbouring nation had proved that the former imputations upon standing armies were entirely unfounded and calumnious; and it was now universally known throughout all Europe, that a man by becoming a soldier did not cease to be a citizen. He thought the new form which the government of France was about to assume, would render her a better neighbour than when her affairs were controlled by the intrigues of ambitious and interested statesmen. Mr Pitt acknowledged that the tumultuous situation of France afforded a prospect of tranquillity; but he thought that the opportunity ought to be seized to raise our army to such a state of respectability as would leave no hopes of future hostility. The present convulsions of France must sooner or later terminate in the re-establishment of order; but there was a probability, that while the fortunate arrangements of such a situation

might render her more formidable, they would also con- Reign of vert her into a less restless neighbour. As an Englishman George III. and as a man, he wished for the restoration of tranquillity in France, though that event appeared to him considerably distant. Whenever it arrived, and her inhabitants became truly free, they must be in possession of a freedom resulting from order and good government, and they would then stand forward as one of the most brilliant powers in Europe; nor could he regard with envious eyes an approximation towards those sentiments which were characteristic of every true British subject. But while Mr Pitt, who had commenced his public career as the champion of political reform, and still on important occasions represented himself as preserving his attachment to popular rights, was thus applauding the first revolutionary movements of the French, his friends considered themselves as at perfect liberty to give utterance to sentiments of a very different nature upon the subject. Viscount Valletort, who moved the address, expressed great compassion for the king of France, then almost a prisoner in his own palace, and for the families of distinction who had found it necessary to fly to foreign countries to avoid the unexampled barbarities which were committed with impunity at home; and Colonel Phipps declared that the praise bestowed by Mr Fox upon the conduct of the French military, was a poor compliment to the profession in general, and that, if he had wanted a subject for panegyric, he ought rather to have adverted to the conduct of the English army during the riots of 1780, when they were not led by false feelings to put themselves at the head of schemes leading to anarchy and cruelty.

On the 9th of February, when the vote of supply for the army came a second time under consideration, Mr Burke revived the subject of the French revolution. He declared himself, in decided terms, an enemy to the measures which had lately taken place in that country; and conceived that it would be the greatest of all calamities for Britain, if any set of men amongst us should represent the late transactions in France as fit objects of imitation. He, however, condemned the greatness of our military establishment, by reason of the weakness of France; and declared, that on looking over the geography of this part of the world, he saw a great gap, a vast blank, the space hitherto occupied by France, which had no longer any political existence. France had at different periods been as dangerous to us by her example as by her hostility. In the last age, we had been in danger of being entangled, by her example, in the net of a relentless despotism. Our present danger, from the example of a people whose character knew no medium, was that of being led, through an admiration of successful fraud and violence, to imitate the excesses of an irrational, unprincipled, proscribing, confiscating, plundering, ferocious, bloody, and tyrannical democracy. They had a good political constitution the day their states general assembled in separate orders; but this they had destroyed. They had now no other system than a determination to destroy all order, subvert all arrangement, and reduce every description of men to one level. It was absurd to compare a proceeding like this to the revolution in England, which neither impaired the monarchy nor the church, and merely drove away a legal monarch, who was attempting arbitrary power.

Mr Fox expressed great concern at differing in opinion from Mr Burke, for whom he avowed the highest reverence and esteem. He repeated his former opinion upon the subject of French affairs, but declared himself an enemy of all absolute forms of government, whether monarchical, aristocratical, or democratical. Mr Sheridan in more unqualified terms stated his disapprobation of Mr Burke's sentiments, expressed his surprise that any man

1790.

George III. horrence of the patriotic proceedings in France, and declared himself as ready as Mr Burke to detest the cruelties which had been committed. He complimented individually the Marquis de Lafayette, M. Bailli, and other French patriots, and expressed a hope that the despotism of France would never be restored; but observed that he ought not on that account to be considered as approving of a wanton persecution of the nobility, or an insult to royalty. Mr Burke answered Mr Sheridan with indignation, declared that Mr Sheridan had sacrificed his friendship for the applause of clubs and associations.

It is probable that Mr Pitt had now become aware of the difficulty of his situation with regard to the French revolution, which at this period was generally regarded with approbation in Britain, as an imitation of that spirit by which our ancestors had raised their country to a state of unexampled prosperity and happiness. Mr Pitt must already have known that the court regarded it in a very different light; and that, at no distant period, his ambition and his love of popularity might become incompatible. On the present occasion he undoubtedly saw with satisfaction a division likely to occur among those who had hitherto been his competitors for popularity; and with that dexterity in debate for which he appears to have been remarkable, he instantly endeavoured to widen the breach, and to attach to himself a man of so much intellectual power as Mr Burke, declaring that he agreed with the latter in almost every thing he had urged respecting the late commotions in France; that the sentiments Mr Burke had professed respecting the British constitution filled him with the sincerest satisfaction; and that the manner in which he had pledged himself to maintain it for ever inviolate, entitled him to the gratitude of his fellow-citizens and the admiration of posterity.

A new effort was made on the 2d of March to procure a repeal of the corporation and test acts. The dissenters had prevailed with Mr Fox to introduce the motion; but the clergy of the church of England, alarmed no doubt at the downfal of the ecclesiastical establishment in France, were anxious to diffuse a spirit of opposition to the intended attack. Mr Fox represented his whole argument as resting upon this principle, that no government has a right to animadvert upon the speculative opinions of its subjects, till these opinions produce a conduct subversive of the public tranquillity. It had been remarked that certain errors in religion tended to disturb the public tranquillity; but surely political errors must have this tendency in a much greater degree; yet such was the absurdity of the test laws, that a man who favoured arbitrary power in his sentiments, who considered the abolition of trial by jury as no violation of liberty, and the invasion of the freedom and law of parliament as no infraction of the constitution, might easily pave his way to the first situations in the state. Mr Pitt, as usual, supported the privileges of the established church; asserting, that though opinions might not be a warrantable ground for criminal accusation, yet they might afford a good reason for excluding particular individuals from the public service; and that to discover dangerous opinions a test might be highly expedient. Mr Burke was decidedly hostile to the measure. Mr Fox had stated the principles of toleration and persecution, but abstract principles he always disliked. Of all abstract principles, however, those of natural right, upon which dissenters rested as their stronghold, were the most idle and the most dangerous; they superseded society, and snapped asunder all those bonds which had for ages constituted the happiness of mankind. He adjured the house not to suffer the fatal incidents which had attend-

Reign of who valued the British government should feel such ab- ed the church of France, plundered and demolished in so Reign of disgraceful a manner, to abate their zeal in favour of our George III present happy and excellent establishment. Mr Fox in reply declared himself filled with grief and shame at the sentiment which Mr Burke had avowed, and asserted that all the principles he had stated had formerly received the sanction of his friend. He thought Mr Burke at present misled by his sensibility; his feelings had been shocked and irritated by a mistaken idea of the transactions in France, which were in reality nothing more than the calaand denied that he was the advocate of despotism; but mities to which every country was unavoidably subject at the period of a revolution in its government, however beneficent and salutary. The proposed repeal was of course rejected on a division.

A few days afterwards Mr Flood brought forward a motion for the reform of the representation of the people in parliament, and proposed to add a hundred members to the House of Commons, to be elected by the resident householders in every county. Mr Windham opposed the motion, on the ground that the country had prospered under the representation as it stood, and because innovations had become extremely dangerous. Where, said he, is the man who would repair his house in the hurricane season? Mr Fox, on the contrary, declared himself as much persuaded as ever of the necessity of reform; but he thought the majority of the nation of a different opinion, and was therefore of opinion that the motion ought to be withdrawn. Mr Pitt considered the proposal as brought forward at an improper time, and said he wished to wait for a more seasonable opportunity, when he would certainly again submit his ideas upon the subject to the considera-

tion of the house. Mr Flood accordingly withdrew his

proposition.

On the 5th of May a message from the king informed both houses of parliament of certain acts of hostility committed by the Spaniards in the seizure of three British vessels which had attempted to establish a foreign trade between China and Nootka Sound, on the west coast of North America. The Spaniards conceiving the whole of that part of the American coast to be their property, were the first to give information of what they had done, and required that steps should be taken by the British government to prevent future encroachments upon that coast. The British navy was instantly augmented; and as a war with Spain, unassisted by France, could not prove very formidable, the public seemed to regard the approach of hostilities with little concern. But the determination evinced induced the Spaniards to come to an accommodation, and the dispute ended without an appeal to arms. During the present session little progress was made in the trial of Mr Hastings; and both parties accused each other as the authors of the delay that had taken place, while the subject began to be neglected or forgotten by the public. On the 10th of June the king put an end to the session by a speech from the throne, and this parliament was dissolved.

At this period the Austrian Netherlands were in a state of great agitation. The people of these provinces had long been governed by a feudal constitution, which vested important privileges in the clergy, the nobles, and certain classes of citizens, but more especially in the clergy. Joseph II. had invaded these privileges, seized upon the greater part of the property belonging to the monasteries, and driven from the country all who opposed his innovations. At length, about the end of the year 1789, the exiles having united on the frontiers, entered the country, and being joined by others, formed a considerable army, which rapidly overran the whole of Austrian Flanders; while the emperor, engaged in a war with the Turks. was prevented from sending any considerable force against

Reign of them. The style of copious and popular elorepublic was to be intrusted to a congress. Meanwhile a considerable number of foreigners entered into the service of this new republic. But it soon appeared that the Belgic revolution would produce no lasting effects. The old aristocratical government, uncontrolled by the authority of a prince, was everywhere adopted; the power of the clergy was even increased; the very first step of the Belgian congress was a public declaration of religious intolerance; and the liberty of the press was prohibited, and state licensers appointed. The consequence was, that discontents speedily arose. But at this period the emperor Joseph died, and was succeeded by Leopold, archduke of Tuscany, who issued a proclamation, inviting the revolted provinces to return to their allegiance, and promising to restore their ancient political constitutions. And not trusting to peaceful measures alone, he sent an army against the insurgents, and at the end of the year the house of Austria had recovered its authority in the Netherlands.

The new parliament assembled on the 25th of November 1790. As no uncommon efforts had taken place at the preceding elections, nearly the same members as formerly were returned to the House of Commons; and Mr Addington was chosen speaker. On the following day the session was opened by a speech from the throne, in which his majesty informed parliament that the differences which had arisen with the court of Spain were brought to an amicable termination; that a separate peace had been concluded between Russia and Sweden; that, in conjunction with his allies, he had employed his mediation to negociate a treaty between Russia and the Porte; that he was endeavouring to assist in putting an end to the dissensions in the Netherlands; but that the peace of India had been interrupted by a war with Tippoo Sultan, son of the late Hyder Ali. The speech concluded with recommending to parliament a particular attention to the state of the province of Canada. Various debates, of little importance in a historical point of view, occurred respecting the negociations with Spain, the fur trade at Nootka Sound, and the expensive naval armament which had been fitted out to enforce the claims of Britain.

But in the beginning of March 1791 a bill was brought into parliament by Mr Pitt for regulating the government of the province of Canada in North America. This circumstance is chiefly worthy of notice on account of an altercation to which it gave rise between Mr Burke and Mr Fox. During the last session of the former parliament Mr Burke had declared his disapprobation of the French revolution, whilst Mr Sheridan and Mr Fox had expressed very opposite sentiments. Mr Pitt, as we have already seen, had dexterously laid hold of the opportunity to excite disunion among his antagonists, and had declared himself highly satisfied with Mr Burke's attachment to the British constitution. Mr Burke, on the other hand, had long been engaged in a career of fruitless opposition to the existing government; and during the king's illness, in the end of the year 1788, he had indicated such an indecent impatience when any expectation was expressed of his majesty's speedy recovery, as sufficiently demonstrated how eager he was to obtain possession of office. It is not improbable, therefore, that the approbation expressed by Mr Pitt, of his fears on account of the French revolution, suggested a decisive opposition to that great national movement, as a mode of ingratiating himself with admi-

George III. bled, appointed an administration, at the head of which cipal attention to the subject. Accordingly, in November George III was Henry Vander Noot, a popular advocate; and in Janu- 1790, he published a treatise, in which he endeavoured quence in which the book was written, together with the sentiments which it contained, produced a great impression; and replies to it were published by Dr Priestley and others; but that which proved most successful in gaining the attention of the public, was the production of Thomas Paine, who had formerly published in North America a pamphlet entitled Common Sense, which proved extremely prejudicial to the royal cause throughout the colonies. His present work contained a statement of the facts connected with the French revolution, together with satirical strictures upon what he accounted imperfections in the British constitution. He was not equal to his antagonist in copiousness of diction; but in shrewdness of remark and concise effective energy of style he was superior. Mr Burke's love of literary fame was great; and it had been highly gratified by the attention which his book had attracted, particularly among the higher orders. Hence, when he saw his reputation rudely assailed, his temper became ruffled; and he appears to have wished for an opportunity of separating himself from his former political associates. Accordingly, on the 6th of May, when the clauses of the Quebec bill were about to be discussed in a committee of the whole house, he rose, as he said, to speak to the general principle of the bill, and enlarged upon the importance of the act which they were about to perform, namely, that of appointing a legislature for a distant people. But he thought the first consideration ough to be the competency of the house to such an act. By what were called the "rights of man," a body of principles lately imported from France, all men are by nature free, and equal in respect to rights. If such a code were admitted, the power of the British legislature could extend no further than to call together the inhabitants of Canada to choose a constitution for themselves. But, rejecting this code, which was never preached without mischief, he assumed the principle, that Britain had acquired the right of legislating for Canada by conquest. The next question was, what model was to be followed in instituting a government for Canada; whether that of America, of France, or of Great Britain, which were the three great modern examples. In discussing this point, he diverged from the subject more immediately before the house, and took an opportunity to pronounce a vehement invective against the principles and enactments adopted by the French national assembly, in attempting to form a new constitution. He was called to order by some of his former friends, and an altercation ensued, in the course of which he asserted that a design had been formed by certain persons in this country against the constitution. Mr Fox accused Mr Burke of leaving the question before the house to seek a difference with him, and to fortify misrepresentations of something which he had said in a former debate concerning the French revolution; and he adhered to his former sentiments in approving the revolution, though not the new constitution of France. Mr Burke repeated his attack upon the French revolution, and declared that his friendship with Mr Fox was dissolved by that accursed event. Mr Fox, with much apparent agitation, endeavoured to soften the asperity of Mr Burke, but without effect. He had evidently resolved upon the part he was to act; and this may be considered as the first occasion upon which any member of the British legislature represented his own conduct as seriously influenced, to the extent of deserting nistration; and that this idea, concurring with his former his former political views and associates, in consequence

Reign of of an alarm originating in the example of the French re-George III. volution. had fallen under the influence of Austria; whilst the re- Reign of volution, or rather the weakness which preceded it, had George III

1791.

During the session, the question of the slave-trade was again brought forward by Mr Wilberforce, and was supported by Mr Pitt and Mr Fox; but his motion was nevertheless negatived by a considerable majority. The zeal of the nation in favour of abolition had however become very great; and as the evidence led before the House of Commons had represented the trade as the source of innumerable crimes and great misery, a company was established with the view of civilizing the natives of Africa, and of cultivating, by the hands of freemen, West India productions in that country; and having received a charter, they fixed on Sierra Leone as their principal settlement, and great expectations were entertained of the success of the project; expectations destined never to be realized.

On the 28th of March a message from his majesty announced that his endeavours to effect a pacification between Russia and the Turks having proved unsuccessful, he had judged it necessary to add weight to his representations, by making some further augmentation of his naval force. The point in dispute related to Oczakow, a town situated upon the Black Sea, at the mouth of the river Dnieper, which had been taken from the Turks, and was considered by Russia as a situation of great importance with reference to future operations against the Ottoman empire. The Turks, greatly exhausted by the contest, were reduced to the necessity of purchasing tranquillity at almost any price; but Prussia, alarmed at the growing power of Russia, had, in conjunction with Britain and Holland, offered to mediate a peace, with a view to procure the restoration of Oczakow to its former masters. Russia, however, refused the offered mediation, and also declined to renew any commercial treaty with Britain; though she had concluded one with France and another with Spain, and even entered into a quadruple alliance with these countries and with Austria, for the purpose of restraining the influence of Prussia, Britain, and Holland. In moving an address to his majesty on this message, Mr Pitt observed, that having entered into defensive alliances, which were admitted to be wise and politic, we ought to adhere to them; that Prussia was our ally, and any event calculated to affect that power, and diminish its influence on the Continent, would be injurious to us, as far as our mutual interests were concerned; and that the progress of the Russian arms against the Porte gave sufficient cause for alarm, since, if the power of the Porte were further humbled by its aspiring rival, Prussia would instantly feel it, and not Prussia alone, but all Europe. Mr Fox, on the contrary, expressed his conviction that Prussia could not be endangered by the progress of the Russian arms in Turkey, and that an alliance with Russia appeared to him the most natural and advantageous which we could possibly form. The address, however, was carried by a large majority. But the opposition, finding that they were supported by greater numbers than usual, and that a war with Russia was unpopular, brought the question repeatedly forward; and administration, perceiving the current of public opinion to run against them, abandoned their views, and refused to support Prussia in attempting to set bounds to the ambition of Russia.

On considering the state of Europe at the time, administration were probably guided, in their jealousy of Russia, by the maxims which had influenced the politics of Great Britain during the best periods of its history. The Spanish monarchy had long been in a state of debility, which rendered it of little weight or importance on the continent of Europe; and France had likewise suffered her armies to decline, and, by a sort of family compact,

volution, or rather the weakness which preceded it, had George III. incapacitated her for interfering in foreign affairs. In the mean time Austria and Russia, relinquishing all rivalship, had entered into a close combination, and acted in subserviency to their mutual ambition. Hence, to preserve some tolerable balance of power on the continent of Europe against these two great military empires, it became absolutely necessary for Great Britain and Holland to unite with Prussia and Sweden, and to protect the Turks, in order to prevent the further aggrandisement of these two great and warlike powers. The British ministry, however, finding a war with Russia likely to prove unpopular, consented that Great Britain should descend from her proud station of holding the balance of the Continent; and the consequences of this desertion speedily appeared; for Prussia, no longer backed by Britain, was under the necessity of joining Russia and Austria in their schemes of aggrandisement at the expense of the weaker powers, that she might strengthen herself by a share of the spoil, and maintain her position in relation to these powers. How far the British administration acted culpably in deserting what they accounted their duty, in compliance with the apparent wish of the nation, is a question which was never discussed, because the consequences of their conduct were soon overlooked and forgotten amidst the great events which speedily occurred. From the love of popularity, and the habit of resisting all the projects of administration, opposition at this time encouraged the pusillanimity of their countrymen; whilst the members of administration, fearful of losing their places, suffered their country to be degraded from its proper rank and influence in Europe, and prepared the way for the partition of Poland, the projected partition of France, the war of the revolution by which that project was resisted, and the immeasurable aggrandisement of the power which soon proved so dangerous to Britain and to all Europe.

An unsuccessful effort was made during this session of parliament by Sir Gilbert Elliot, to procure for the members of the church of Scotland an exemption from the test act. But the Roman Catholics in England were more fortunate in obtaining relief from certain penal statutes. As the Catholic church was the great object both of political and religious terror in the first stages of the reformation, the English statute book was loaded with the most rigorous edicts against the professors of that obnoxious faith; and though some of these were removed in the year 1780, yet in 1791 not less than seventy pages of Burn's Ecclesiastical Law were occupied with the enumeration of the penal statutes in force against the Roman Catholics. Amongst these were some of the most sanguinary nature. For example, it was high treason and death to make a convert to the Catholic faith; and severe penalties were enacted against papists for hearing mass by some statutes, whilst by others they were compelled to attend the established worship, however contrary to their consciences. A reform was therefore imperiously called for, and had become the more reasonable, as, in the year 1790, a body of Catholic dissenters had formally protested against the temporal power of the pope, and against his assumed authority to release men from their civil obligations, or to dispense with the sacredness of oaths. Mr Milford, therefore, brought forward a bill to relieve the protesting Catholics from the penalties and disabilities to which persons professing the Romish religion were subject by law; and the bill passed unanimously, excepting that Mr Fox wished to extend it, not merely to protesting, but to all Roman Catholics: upon the principle, that the state has no right to inquire into the opinions, either political or religious, of the people, but only to take cognizance of their actions. Reign or

In the trial of Mr Hastings little progress was made during the present session. As parliament had been dissolved during the dependence of the trial, a question occurred, whether that circumstance did not put an end to the impeachment. The friends of Mr Hastings adopted the affirmative side of the question, and were supported by Mr Erskine and the attorney and solicitor general, Macdonald and Scott; whilst Mr Pitt, Mr Burke, and Mr Fox contended that a dissolution could have no effect upon an impeachment. After much discussion, it was carried in the House of Commons that the impeachment was still depending, and the same decision was adopted by the House of 10th of June.

As the avowed object of the first leaders of the revolution in France was the establishment of a system of political freedom, or of a representative government, with a hereditary monarch at its head; and as one of the consequences which they expected to follow from the establishment of the new system was the complete abolition of wars, which they ascribed entirely to the ambition of kings; the progress of the revolution was regarded with much favour by many persons in Great Britain. The reform of the Gallican church, though it alarmed the English clergy, was favourably regarded by the English dissenters; and the abolition of titles of honour was not disliked in a country where they are only enjoyed by a few individuals, and are chiefly valued on account of the privilege of hereditary legislation by which they are accompanied. The English also had long been accustomed to boast of their political freedom, and of their superiority in this respect over their French neighbours; and hence, when the populace of Paris rose in arms, when the military refused to act against them, and when the state prison or fortress of the Bastille was taken and demolished, many persons in Great Britain regarded as an imitation of the efforts of our ancestors the attempts made by the French to shake off the ancient despotism, and to renovate the order of society. The public at large indeed had not yet given much attention to the subject; but of the speculative and enthusiastic there was a sufficient number to form numerous convivial parties in commemoration of the 14th of July, the day on which the Bastille had been taken. These meetings, it is true, were on the whole regarded

George III. debates during the present session. Like all other wars cal part of our constitution; but no public expression of George III 1791-

The contents of this placard were very generally circulated, and produced much conversation in having speedily thereafter induced the Dutch and French the town; upon which the magistrates offered a reward to join him against the British, the forts were given up of a hundred guineas for discovering the author, printer, to the Dutch; that in 1789, Tippoo had again claimed the or publisher. Meanwhile the friends of the intended forts; and that the Dutch, dreading his power, had sold meeting disclaimed in the strongest terms the sentiments the forts to the rajah of Travancore, a vassal or ally of expressed in the seditious handbill; and finding their views misrepresented, they at first resolved that the meeting should not take place; but another determination was effected the purchase under secret instructions from the British government in India, he was defended by them. number of eighty. The party, however, had scarcely met when the house was surrounded by a tumultuous rabble, who expressed their disapprobation by hisses and groans, and by shouting "church and king." Upon this the meeting immediately dispersed. But in the evening the mob attacked and burned a Unitarian meeting-house belonging to the congregation of Dr Priestley; and although this distinguished person had not been present at the meeting, his house, from which he was compelled to fly with his family, was also attacked, and his library, his valuable philosophical apparatus, and his manuscripts and papers, were destroyed. During the three succeeding days they destroyed some other meeting-houses, together with the dwellinghouses of several eminent dissenters in the neighbourhood; and it was not till the night of the fourth day that some parties of light dragoons arrived. The damage done was very great; and the magistrates were accused of at first favouring and encouraging the mob, whose excesses they afterwards found it impossible to restrain. Five of the rioters were tried at Worcester, and one was convict-Lords. The session of parliament was concluded on the ed and executed. At Warwick twelve were tried, and four convicted of burning and destroying houses, three of whom were executed, and one was reprieved upon the application of the magistrates, as it appeared that his interference in the riot had been accidental.

> At this time a foundation was laid on the Continent for the most important political changes. The various nations of Europe had for some centuries owed their independence to the jealousies which they mutually entertained. Many petty states were altogether unable to contend in war against their powerful neighbours; but they owed their safety to the circumstance of their neighbours being held in check by other great powers, who resisted all attempts at aggrandisement. When one nation became dangerous by its ambition, the combination of a number of other states repressed its machinations; and thus the Spanish, and afterwards the French monarchies, were restrained within due bounds. But in the course of the century the power of Russia had become formidable in Europe; and its rulers sought rather to undermine than to overthrow that balance of strength to which the lesser states of Europe had owed their safety. A former Russian sovereign had entered into a close alliance with the head of the house of Austria; and, notwithstanding the talents of the great Frederick, this union had nearly proved fatal to the Prussian monarchy. Finding the advantage of such an alliance, the house of Austria attempted at the same time to attach itself to France, its ancient hereditary enemy, by the marriage of the archduchess Marie Antoinette to the dauphin, afterwards Louis XVI.; and this marriage fully produced all its intended political effects. French court, relinquishing its former policy of humbling

Reign of Austria, suffered its armies to fall into decay, and allowed the Swiss cantons, if they became parties to the coalition, Reign of George III. itself to be led on all occasions by this more active power; and the revolution, which wrought so radical a change in the government of the nation and the order of society, by subverting every existing establishment, and exciting jealousy and discontent in every quarter, reduced the nation, in the eyes of foreign powers, to a state of utter debility. The king and royal family, exposed to endless insults and humiliations, had been compelled to submit to a new constitution, which placed the royal authority on a very precarious footing; the principal nobility had emigrated, and the king himself had attempted to follow their example; but being seized at Varennes, he was brought back as a fugitive, and placed at the head of a form of government which he had neither the power nor the inclination to administer.

In this state of affairs Russia and Austria, acting in conjunction, saw nothing to resist their ambition. They had recently wished to seize upon and divide the richest provinces of Turkey; but the Austrians having met with unexpected resistance, desisted from the attempt. The Russians however were more successful. The king of Prussia, with the aid of Britain and Holland, had attempted to restrain their progress; but being deserted by Britain, he now found it necessary to keep on fair terms both with Russia and Austria; and for this purpose, as well as to avoid being left behind in the career of usurpation and aggrandisement, he was compelled to enter into all their ambitious schemes. Poland and France were at this time two of the weakest states in Europe. For the sake of erecting a barrier to his own states, the Prussian monarch had encouraged the king and the leading nobles to form a new political constitution for Poland, by which its government might be strengthened; but Russia and Austria had cast their eyes upon this country, with a view, in imitation of what had been done in 1772, of seizing its best provinces; and the king of Prussia now found it necessary to acquiesce in the project. And the state of France at this period held out strong temptations for the formation of a similar project respecting it. Leopold, emperor of Germany, had a fair excuse for interfering in French affairs, namely, to rescue the king from the state of thraldom to which he had been reduced by his subjects: and the other princes of Europe had become alarmed at the example set by France, of limiting the authority of the monarch, of destroying the privileges of the nobility, and of reducing to a level all classes of persons in the state. The united powers of the north, therefore, now resolved to restore the French king and his nobles, but at the same time determined to divide among themselves and their allies some of the provinces of France. Towards the close of the summer 1791 these points were adjusted, at a conference held at Pilnitz in Saxony, between the emperor Leopold and the king of Prussia. The treaty entered into was intended to be kept secret; but the substance of it soon transpired, and afterwards, by the hatred which it excited in the French nation, proved the cause of important events. Its general object is understood to have been the dismemberment of Poland, and also of part of France. Poland was to be divided among the three great military powers in different portions. With regard to France, the emperor was to obtain Bavaria in exchange for the French Netherlands, which he was to conquer, and transfer, along with the Austrian Netherlands, to the elector of Bavaria. The Archduke Charles was to obtain the duchy of Lorrain; Strasburg and Alsace were to be restored to the empire; the king of Sardinia was to receive Dauphiné, if he acceded to the coalition; Spain, on the same condition, was to be accommodated with the French portion of the island

were likewise to receive certain territories. This treaty George III. was publicly disavowed; but it was nevertheless universally believed throughout Europe to have been entered into, and was accordingly talked of under the appellation of the "Concert of Princes."

Parliament assembled on the 31st of January 1792, and a variety of uninteresting debates occurred, the principal of which related to the armament which had been fitted out on account of the dispute with Russia concerning the fortress of Oczakow. During the preceding autumn, the Duke of York, second son of the king, had married a daughter of the king of Prussia. This prince was believed to be a favourite son; and as the marriage in question had been contracted, not from political considerations, but the private choice of the parties, it gave general satisfaction. A provision of L.37,000 per annum was readily made by parliament for the royal pair. On the 17th of February Mr Pitt brought forward a statement of the public revenue, from which it appeared that nearly half a million might be applied towards the extinction of taxes, or the payment of the national debt; and this was accordingly done; the additional tax recently laid on malt, the taxes on female servants, on carts and waggons, and on houses under seven windows, and part of the duty on candles, being those repealed. On the 2d of April the question of the slave-trade was again brought under the consideration of the House of Commons by Mr Wilberforce. He disclaimed any project of emancipating the negroes, but contended that, by the abolition of the importation of new slaves, the state of those in the West Indies would be improved. The slavetrade was defended on this occasion by Colonel Tarleton and Mr Jenkinson; while Mr Wilberforce was supported by Mr Montague, Mr Whitbread, and Mr Milbank. Mr Dundas professed himself a friend to the abolition, but entertained doubts with respect to the mode of effecting it. Mr Addington agreed in opinion with Mr Dundas. He thought the trade ought to exist for some years longer, and therefore could not vote for an immediate abolition. Mr Fox deprecated every kind of deception or delusion practised upon the country, and reprobated in strong terms Mr Addington's views of the subject. Mr Dundas moved, as an amendment to Mr Wilberforce's motion, that the trade should be abolished gradually; and although Mr Pitt declared his disapprobation of the amendment, the motion for a gradual abolition was carried by a considerable majority. Soon afterwards Mr Dundas stated the regulations which he meant to propose for the gradual abolition of the trade. The chief of these consisted in increasing the duties upon the age of the negroes imported; abolishing the trade as far as not necessary for the supply of our own islands; limiting the tonnage to be employed in it; punishing British subjects guilty of crimes in carrying it on; and providing that the importation of negroes into the British colonies should cease on the first of January 1800. Mr Wilberforce disclaimed all acquiescence in these propositions; and Mr Fox ridiculed them, by asking where the baptismal register was kept on the coast of Africa, by which the age of those who were to be exported could be ascertained. A variety of amendments were now proposed; and it was at length agreed that the period of abolition should be fixed for the first of January 1796. In the upper house the advocates of abolition were less successful; and they were not a little provoked at finding one of the younger branches of the royal family, the Duke of Clarence, now William IV., declaring himself decidedly hostile to their wishes. It was ultimately resolved that evidence should be heard at the bar, which necessarily produced delay, and little or no progress was of St. Domingo, with Corsica, Rousillon, and Bearn; and made during the rest of the session. On the 18th of April

Reign of Mr Sheridan moved for an inquiry into certain grievances George III. complained of by the royal burghs of Scotland, fifty out of the sixty-six having concurred in the petition upon which Mr Sheridan grounded his motion. The motion was resisted by Mr Anstruther, Mr Dundas, and Sir J. St Clair Erskine, upon the general ground that no serious grievance existed; and the inquiry was refused by a large majority. Excepting some debates relative to the French revolution, nothing further of any importance occurred during the present session.

That we may not afterwards have occasion to interrupt the detail of the transactions connected with the state of affairs in France, we shall here notice the war in India, and western side of the peninsula of Hindustan consists of a level country for upwards of seventy miles inwards. Behind this tract, and parallel to the ocean, runs a chain of lofty mountains, presenting a front towards the west, broken into tremendous precipices, but on the other side consisting of an extensive plain, gradually descending eastward to the Bay of Bengal, and forming the territory of the Mahrattas, Mysore, Madras, the Carnatic, and other states. Now as Tippoo Sahib possessed territory on both sides of these mountains, which are denominated Ghauts, from the narrow paths or passes by which they are crossed, the army of the Carnatic, under General Meadows, was directed to attack this territory from the east; the Bombay army, under General Abercromby, was to reduce the country to the westward of the Ghauts; the Mahrattas, and the nizam of the Deccan, agreed to attack Tippoo's country on the north and north-east, where it bordered on their own territories; and Seringapatam, his capital, was fixed upon as the point towards which the whole of the hostile armies were to direct and concentrate their efforts. On the 15th of June 1790, General Meadows entered Tippoo's country. The grand army on this occasion amounted to fourteen thousand effective European troops, a body of men which no power in India could encounter in the field. A variety of operations occurred; but little appears to have been effected towards the subjugation of the enemy, except the capture of the country to the westward of the Ghauts, till the end of February 1791, when Lord Cornwallis assumed the command in person. His first operation was directed against Bangalore, which he reached on the 5th of March; and a practicable breach having been made in the walls, the fort was stormed on the 21st, with little loss to the British. Of the garrison not less than a thousand were bayoneted, and a small number taken. Being joined by above fourteen thousand of the nizam's troops, and seven hundred Europeans, with four thousand five hundred and eighty troops under Colonel Oldham, Lord Cornwallis proceeded towards Seringapatam, where he arrived on the 13th of May, after a difficult march in bad weather over a hilly and barren country. Tippoo lost no time in displaying a considerable force in the field, with the view of covering his capital; but being beaten, though with little loss, he was forced to retire within the walls of Seringapatam, which, defended by a river at this season swelled with the rains, seemed secure against attack. In fact, circumstances had completely defeated the object of the combined operation which had been so ably projected. Lord Cornwallis was in want of provisions for supporting his army during a protracted siege; and as General Abercromby had not been able to join him from the west, it was judged expedient to retire to Bangalore, after destroying the battering train. On his retreat Lord Cornwallis was joined by the Mahrattas to the number of about thirty thousand. General Abercromby also retired across the Ghauts with a fatigued and dispirited army; and thus for the present Tippoo escaped a siege in his capital.

After his retreat, Lord Cornwallis employed himself for Reign of some time in reducing various small forts in the neigh-George III. bourhood of Bangalore, some of them of such natural strength as, in any other hands but those of the feeble natives of that country, to be absolutely impregnable. Nundidroog, built on the summit of a mountain 1700 feet in height, three fourths of which are altogether inaccessible, fell after a siege which lasted from the 22d of September to the 18th of October; the place being assaulted by a breach at midnight, and taken, though not by surprise. The fortress of Savendroog, eighteen miles to the westward of Bangalore, was still more strongly situated. It stood on the summit of an insulated rock, rising about which was now brought to a fortunate termination. The half a mile in perpendicular height, from a table or base of eight or ten miles in circumference, and divided at its summit into two hills, each having its peculiar defences, capable of being maintained independent of the lower works; while the whole was surrounded by a strong wall, with cross walls and barriers in every accessible part. Yet this stupendous fortress was taken in ten days.

In December, General Abercromby once more crossed the Ghauts, and proceeded eastward towards Mysore; while Lord Cornwallis, in the beginning of February 1792, advanced from Bangalore, and arrived on the 5th within sight of Seringapatam. Tippoo Sultan occupied a position under the walls, and there resolved to make a stand in defence of his capital. On the 6th, at eight o'clock in the evening, the attack was made on the sultan's camp. After a sharp engagement at different points, parties of the British crossed the river, and established themselves in the island on which Seringapatam stands. This movement proved decisive. Tippoo, finding himself in danger of having his retreat intercepted, was compelled to retire; and being pressed by the invaders on all sides, while his palace and gardens were in their possession, and his power reduced within the narrow limits of a fortress, he found it necessary to endeavour to purchase peace upon almost any terms. With this view he released two prisoners, Lieutenants Chalmers and Nash, and requested the former of these gentlemen to present a letter from him to Lord Cornwallis. The operations of the siege, however, still continued, and, on the 19th of February, the trenches were opened; whilst the Bombay army, under General Abercromby, invested the western side of the capital. But a cessation of hostilities was agreed to on the 23d of February, and a treaty of peace concluded, by which it was stipulated, first, that Tippoo was to cede one half of his dominions to the British and Indian powers; secondly, that he was to pay in money three crores and thirty lacs of rupees; thirdly, that all prisoners were to be restored; and fourthly, that two of the sultan's sons were to become hostages for the due performance of the treaty. On the 26th, the two princes, each mounted on an elephant, richly caparisoned, proceeded from the fort to Lord Cornwallis's camp, where they were received by his lord-ship with his staff. The eldest, Abdul Kallich, was about ten, and the youngest, Mooza-ud-deen, about eight years of age; and they were dressed in long white muslin gowns, with red turbans richly adorned with pearls. Educated from infancy with the utmost care, the spectators were astonished to behold in these children all the reserve, politeness, and attention, of maturer years. The kindness with which they were received by the British commander appeared to afford them satisfaction; some presents were exchanged; and the scene is described by an eye-witness as in the highest degree interesting. It was the 19th of March before the definitive treaty was finally adjusted, and delivered by the young princes into the hands of Lord Cornwallis.

In the meanwhile scenes of unparalleled interest were

Reign of about to be exhibited in Europe. These were produced by Britain, and the pride of having recently contributed to Reign of George III. two causes; the ambition of the great military powers, and the French revolution. When, by an abuse of that policy which had once produced a vigilant attention to the balance of power, Russia and Austria had formed the project of extending their dominions, and when Prussia, probably nothing loth, found it expedient to concur in their policy, it became evident that the situation of Europe must speedily undergo great changes; whilst the French revolution, which had reduced that once powerful monarchy to a state of complete debility, seemed to afford an opportunity for the extension of the system of spoliation, by enabling the great powers to regard its ample territories as a further subject of partition. In another point of view, however, this revolution had now begun to be an object of no small alarm. The distinguished place which France had held among the nations of Europe rendered the late change of her government an object of universal attention; and there was a danger that it might come to be rewhich took place in her national assemblies, and in printed publications, were conveyed, through the medium of a language universally understood, to the most obscure corners of Europe; and kings, nobles, and priests, became apa general wish prevailed among the ruling classes that an effort should be made, before it was too late, to overwhelm the country from which so much danger to established governments was anticipated. Nor was this alarm altogether groundless. Men had almost everywhere outgrown their institutions; and whilst the former had been rapidly advancing, the latter remained stationary. The diffusion of wealth and of knowledge had created new interests, and led to the formation of new opinions; whilst a new class, formerly considered by rulers as of little or no importance whatever, except as subjects of taxation or instruments of ambition, was gradually and steadily rising into importance. The power of the nobility was rapidly passing away. The establishment of standing armies rendered them of little importance in war; and their wealth, as the great landholders of Europe, was daily more and more eclipsed by the opulence of the industrious classes; while, though titles of honour still remained, the estimation in which they were held was from various causes much diminished. But prodigious abuses remained. In those states which in former times had resisted the innovations produced by religious zeal, a wealthy priesthood and monastic orders still existed. The privileges of the nobles and of the clergy rendered taxation unequal; and commerce was embarrassed by restrictive laws and the privileges of old incorporations. There was therefore much to be reformed among the continental states of Europe, and the desire to obtain this reform was daily increasing.

In France, though the house of Bourbon had supported the Roman Catholic religion, yet, upon the whole, they were of a much more liberal spirit than any other royal family in Europe, and had given greater encouragement to letters, and to every kind of improvement. It is not wonderful, therefore, that the desire for improving the condition of mankind, and simplifying the arrangements of society, which had been so successfully pursued in other countries, should have become extremely prevalent in France. Unfortunately, however, though the character of the reigning monarch led him to encourage such projects, yet his undecided and inactive spirit, together with the embarrassed state of the finances, prevented him from taking the lead in these changes, or from repressing them when inordienjoyed under the free constitution of Great experiments; and that he saw with concern, gentlemen who

the establishment of a republican government in North George III America, fixed the character of any changes of a political nature, which at this period originated in France, whether among men of letters, the army, or the people at large. But in forming a political constitution, the vanity of the French, which induced them to avoid the appearance of servile imitation, had unhappily led them to differ in one most essential point from the British constitution. Their legislature consisted only of a king and a single house of representatives; whereas in Britain, by means of an intermediate estate, that of the peerage, naturally jealous of popular innovation, laws injurious to the royal prerogative are prevented from being enacted without the king being involved in dispute with the Commons. But in France the king himself was under the necessity, in such cases, of preventing the passing of the law, by personally interposing a negative; that is, he was placed in the unpopular and absurd situation of opposing his single garded as an object of imitation. The public discussions judgment to the united will of a nation, and that too in perilous and critical times, when he could not fail to be suspected of disliking a constitution by which his power was taken away. Still, however, the representative government of Britain had been the model on which the prehensive that the contagion of innovation might not be French proceeded; and there is no doubt that they exconfined to the country in which it had originated. Hence pected, during any contest in which they might be involved with the powers of the Continent, that they would enjoy, if not the support, at least the neutrality and favourable countenance of the British nation. But, on the other hand, the passion for innovation which seized the French nation, had in many instances proceeded to extravagant lengths; and there was reason to anticipate, on the part of the court of London, some alarm lest this passion might communicate itself in an inconvenient degree to Britain, where, though political abuses were less flagrant, and the passion would consequently find less food for its exertion, enough might yet exist to kindle disturbances and produce anxiety.

1792.

In the month of April 1792 a society was instituted in London, at the head of which appeared Mr Grey, Mr Baker, Mr Whitbread, Mr Sheridan, Mr Lambton, Mr Erskine, and several other distinguished members of parliament, for the purpose of obtaining a reform in the representation of the people. The association assumed the title of "The Friends of the People;" and it was speedily joined by some respectable characters in the commercial and literary world. Similar societies had, at former periods, existed in Great Britain; and the Duke of Richmond, Mr Pitt, and others, while they zealously advocated parliamentary reform, had attended meetings, not merely of persons acting in their individual capacity, but of persons appearing as delegates from other societies. At the present period, however, government appears to have regarded any association of this kind as unusually dangerous. The society had resolved that, early in the ensuing session, a motion should be brought forward in the House of Commons for a reform of parliament, and that the conduct of the business should be committed to Mr Grey and Mr Erskine; and, in conformity with the intentions of the association, Mr Grey, on the 30th of April, gave notice in the house of a motion which he intended, next session, to submit to their consideration, for a reform in the representation of the people. Its necessity, he said, had been admitted both by Mr Pitt and Mr Fox. The times were indeed critical, and the minds of the people agitated; but his object was to tranquillize them, by removing every cause of complaint. Mr Pitt declared, with unusual vehemence, that he objected both to the time and the mode in which this business was brought mately pursued by others. Meanwhile the example of forward; that the present was not a time to make hazardous

Reign of might only desire an amelioration of our institutions united sinister designs. The plan of the persons to whom he Reign of George III. in an association with others who professed not reform only, but direct hostility to the very form of our government, and who threatened the extinction of monarchy and every thing which promoted order and subordination in a state. Mr Fox declared himself satisfied concerning the necessity of a reform in the representation, but that he never entertained very sanguine hopes of its accomplishment. Had his honourable friend consulted him, he should have hesitated in recommending the part he had taken; but having taken it, he could not see why the period was improper for the discussion. He professed a strong attachment to the British constitution, but did not regard this as the only free country in the world. After a tumultuous debate, in which Mr Burke and Mr Wyndham opposed Mr Sheridan and Mr Erskine, the subject was dropt. In the mean time a variety of political pamphlets daily appeared, the most remarkable of which was a publication by Thomas Paine, entitled The Rights of Man. This being a direct and inflammatory attack upon the whole principles and practice of the British constitution, administration thought fit to issue a royal proclamation against the publishing and dispersing of seditious writings; enjoining the magistrates to exercise vigilance in attempting to discover the authors of such writings, and exhorting the people to guard against all attempts which aimed at the subversion of regular government. It is not easy to perceive what precise purpose government intended to serve by this proclamation. The authors of the seditious publications alluded to did not conceal themselves; and the publications were openly sold without any attempt to suppress them by prosecutions. Perhaps it was intended to prepare the minds of men for future measures of direct hostility against France; perhaps it was only meant to rouse in the friends of government a spirit of opposition to the schemes of innovation which were at this time afloat. But whatever object administration might have in view, the effect of their proclamation was to excite general curiosity, and to serve as a public advertisement to the dangerous writings of Thomas Paine and others. In all parts of the island multitudes of persons, who had not hitherto interrupted their ordinary occupations to attend to the transactions of the Continent, or the speculative discussions which the present state of France had excited, were now seen crowding to the shops of booksellers inquiring for the treatises, the names or titles of which they knew not, against which the king's proclamation had issued; every printing press in the kingdom was occupied, and copies could scarcely be supplied in sufficient abundance to satisfy the demand. Nor did the folly of government stop here. On the 25th of May the master of the rolls moved an address to his majesty, in pursuance of the proclamation, the object of which he admitted to be Mr Paine's works; and having read an extract from one of the pamphlets of that writer, importing that all kings were tyrants, and their subjects slaves, he complained of the circulation of such publications. Mr Grey asserted that the minister, apprehensive of the effects of the asso- north, a very different fate awaited their efforts against ciation of the friends of the people, had concerted this measure with an insidious view of separating those who had long been connected; and alleged that such sinister practices were delighted in by a gentleman whose political life was a tissue of inconsistency, and who never proposed a measure without intending to delude his hearers. Mr Fox disapproved of the proclamation, because it was insidious and ambiguous, tending to propagate vague and unnecessary alarm. Mr Pitt did not impute any improper design to the new association; but it might be taken ad-

alluded was evidently to overturn the monarchy, and con-George III. vert the kingdom into a republic. The address to the throne was agreed to without a division. In the House of Lords, on the 31st of May, a similar address was voted after some debate; and parliament was prorogued a short time afterwards.

The eyes of all Europe were now turned towards France; and the combination which the continental monarchs were known to have formed against that country was expected speedily to issue in action. The king of Sweden, who was fond of war, having now settled all disputes with Russia, offered to lead in person the armies of the combined powers, to destroy in France those new institutions and opinions which threatened to subvert the whole ancient system of public order in Europe. But continuing at variance with his nobility, he was assassinated at a masquerade on the 16th of March, by an enthusiast of the name of Ankerström, who boasted, on being seized, that he had liberated his country from a tyrant. In the meanwhile Leopold, emperor of Germany, had also died, and been succeeded by his son Francis II. Leopold had chosen to temporize with France; but his successor thought it unnecessary to observe any measures of caution with that country. On some remonstrances being made by the French government against his permitting troops to assemble on the frontiers, he avowed the concert of princes against the constitution of France, and stated it to be one of the conditions necessary to the preservation of peace, that the neighbouring powers should have no reason for the apprehensions which arose from the present weakness of the internal government of France. This acknowledged intention to interfere in the internal affairs of the French nation produced a proposal on the part of the French king to the national assembly, which was readily acceded to, for declaring war against the king of Hungary and Bohemia; and in a short time war was in like manner declared against Prussia and Sardinia.

In the meanwhile, though the combined princes had not probably as yet completely adjusted their respective shares of the spoils of France and Poland, yet, that the latter might be kept in a state of weakness, and that all traces of the new principles might as far as possible be obliterated, the empress of Russia gave notice of her determination to invade Poland with an army of a hundred and fifty thousand men, for the purpose of overturning the new constitution. No provision had been made by the king to resist such a force; but an attempt was made by Kosciusko, a Polish nobleman, who had served under General Washington in America, to defend the independence of the country; and some battles were, in consequence, fought. But the Russians continued to advance; and on the 23d of July the king, despairing of the result of the contest, submitted without reserve to Russia, and consented to the restoration of the old constitution, with all its weakness and anarchy.

While the combined princes were thus successful in the France. The French king and his ministry caused the Austrian Netherlands to be invaded; and four different detachments under Lafayette and other generals were directed to enter that country at different points. They made some progress, but their raw troops were speedily repulsed; and when Prussia and Austria, who had undertaken the extinction of the revolution in France, had completed their preparations, the Duke of Brunswick was appointed commander of the combined armies. In a long manifesto issued by the emperor and the king of Prussia. vantage of by ill-disposed persons, who, under the shelter they thought it necessary to disclaim all views of aggranof a respectable body, might push forward their own disement, or interference in the internal administration of

Reign of France; but they declared themselves resolved to re- course of his march, while the French army under Du- Reign of George III. establish in that country public security, meaning the ancient order of things, and to protect the persons and property of all loyal subjects; threatened to punish as rebels all who resisted them; and declared their determination to give up the city of Paris to the most terrible vengeance if the least insult were offered to the king, the queen. or the royal family. The Duke of Brunswick also issued a manifesto, in his own name, dated from his head-quarters at Coblentz, in which he declared that the two allied courts had no intention to make conquests in France, and that they intended merely to deliver the king from captivity, and to restore his authority; he promised protection to all who submitted to the king, required the national guards to protect the public safety till further orders, and threatened to treat those who resisted him in arms as rebels to their king; enjoined the officers and soldiers of the French regular troops to submit to their legitimate sovereign; declared the French magistrates responsible, on pain of losing their heads and estates, for every disorder which they should not have attempted to prevent; menaced with death the inhabitants of towns and villages who should defend themselves against his troops, but promised protection to those who should submit; called upon the city of Paris to yield instantly to the authority of the king; declared the members of the national assembly, and the magistrates and national guards of Paris, personally responsible for disobeword of the emperor and king, if the palace of the Tuilleries were forced, or the least outrage offered to the king, queen, and royal family of France, or if they were not immediately placed in safety and set at liberty, to inflict the most exemplary punishment, by giving up the city of Paris to military execution; and declared that no other laws could be acknowledged in France, excepting those derived from the king, who was invited to repair to a fronorder, and the regular administration of his kingdom.

This fatal manifesto had no sooner been published than all France was in commotion. The insolent language employed by two foreign powers, one of which had for ages been regarded with a sort of hereditary hostility, wounded the pride and the patriotism of every Frenchman; many who were enemies of the revolution could not brook an open attack upon the national independence; the zeal of those who had been enthusiastic promoters of freedom was kindled into absolute frenzy; and multitudes from all quarters hastened to the frontiers to share the danger of protecting the independence of their country. Unhappily for the monarch, the enemies of the nation had loudly declared themselves as his friends; and the restoration of absolute power was made the excuse for a hostile invasion of France. The king, therefore, and all who were attached to him, became objects of public hatred. The republican party had previously been small, but every hour now procured it a fresh accession of strength; and as it appeared dangerous to intrust the national defence to the hands of the king, it was resolved to get rid of his authority altogether. He was therefore dethroned on the 10th of August, and a republic proclaimed; and soon afterwards the capital became the scene of a sanguinary massacre of those persons who had been imprisoned on suspicion of adhering to his cause.

The Duke of Brunswick was, in the mean time, advancing into the heart of the country at the head of the combined army. Verdun and Longwy had surrendered to his arms in the end of August, and by this time he had reached the neighbourhood of Chalons. But he had met with opposition at every step of his progress; and the people of

mouriez was supplied with every necessary. At length, as George III. the French daily acquired discipline, General Kellerman was able to sustain at Valmy, with sixteen thousand men, an attack which, though made by a superior force, and persevered in for fourteen hours, effected nothing. able to make any serious impression on the raw levies opposed to it, the combined army also suffered by disease, which thinned its ranks; whilst the French were rapidly augmenting in numbers and courage; so that the advance to Paris, which seems to have been regarded as a sort of holiday promenade, became an achievement beyond the power of the invaders to execute. The king of Prussia was personally present with the army, and enabled to judge of the difficulties as well as dangers of his position. A war of the people revealed itself to his astonished view; and he perceived, that before he could accomplish the object of the coalition, he must not only conquer an army animated with an enthusiastic spirit of patriotism, but subdue a whole nation, ready to rise in mass to resist the aggression on its territory. The prospect was abundantly gloomy; and his Prussian majesty was appalled by it. Accordingly a retrograde movement was commenced without any attempt being made to penetrate farther into the country; and some suspicions were at this time entertained by discerning men, that France would not have much to dread from the obstinate hostility of the king of Prussia. After his dience, and amenable to military law; threatened, on the retreat, the French, with wonderful activity, commenced offensive operations. In October General Custine reduced Mentz; in the same month Dumouriez invaded the Netherlands; on the 4th of November he fought the celebrated battle of Jemmappes, in which the Austrians were defeated; and as the emperor Joseph II., trusting to his alliance with France, had demolished the fortifications of the towns in the Netherlands, excepting Luxembourg and the citadel of Antwerp, the whole of that country, as tier town, where he might provide for the restoration of far as the frontiers of Holland, now fell into the hands of the French. After the victory of Jemmappes, the government of the French republic, in order to conciliate the inhabitants of the Austrian Netherlands, resolved to open the navigation of the river Scheldt, which for some centuries had been kept shut by the jealousy of the Dutch, and thus to revive the trade of Antwerp, anciently one of the first commercial cities in Europe; and at the same time, in order if possible to counteract the combination of princes which had been formed against them, and which was now rapidly extending itself, the convention endeavoured to represent theirs as the cause of the people in every country, in opposition to that of their princes or hereditary rulers, who were denominated tyrants. Accordingly, on the 19th of November, the convention passed a decree, declaring, that they would give assistance, by means of their armies and otherwise, to every people who should attempt to establish a free government for themselves; and two months afterwards, the same body, by a majority of votes, ordered their imprisoned monarch to be put to death upon an accusation of having betrayed the cause of the nation.

The important transactions which were now taking place on the Continent produced a powerful impression upon the British nation, where the minds of men, as already remarked, had been directed to political questions by the royal proclamation against seditious publications. According as the sentiments of individuals varied, they perused with terror or with satisfaction the Duke of Brunswick's manifesto. Men of a patriotic character, however, whatever their political opinions might be, were not dissatisfied to see a nation capable, even amidst great public confusion, of repelling an invasion by the best disciplined armies, conducted the country had removed all kinds of provisions from the by the most experienced commanders in Europe. But the

George III. with the treatment of the royal family, excited very different sentiments, and were justly regarded as instances of unparalleled barbarity and wanton bloodshed; and the general result was, that by the months of August and September the whole British nation was in a most agitated state. In all companies, questions as to the comparative merits of monarchical and republican government, together with the propriety of a reform in the British House of Commons, formed the subjects of conversation; and persons of every rank entered into these discussions with singular eagerness. At the commencement of the revolution, very few had any idea that a republican government would be found practicable in France; and with regard to Britain, which enjoyed a sound administration of justice and much internal prosperity, no change whatever seemed necessary. But, in proportion as the French proved victorious, a republican government seemed less and less impracticable; and, as the subject of political abuses was canvassed, new ideas concerning the state of government in Britain began to be entertained. The scenes of tumult and corruption which occurred at elections, the inattention of parliament to the petitions for the abolition of the slave-trade, the memory of the coalition, and the reproach under which the House of Commons since that time had fallen, induced many to think a reform in the representation of the people absolutely necessary. New notions were daily broached at home, or imported from the volcanic region of France; and one in particular, that of the boundless perfectibility of the human mind, which is so true in theory, but so false in fact, became extremely prevalent, and gained singular favour. Men of science or benevolence, who judged of others from the rectitude of their own intentions; men of ardent imaginations, who believed every thing practicable to their unbounded zeal; and the young and inexperienced, who were unacquainted with the imperfections of the human character; all imagined that the period had arrived when mankind, become rational and just, were no longer to engage in wars of ambition,—when good sense alone was to rule the world,-and when the public business of society, reduced to the narrow limits of administering justice, and constructing high roads, harbours, and other works of internal improvement, might be conducted with little trouble, and without the establishment of different ranks and orders of men, or the display of military force for the preservation of public tranquility. In short, a species of delirium upon political subjects prevailed; and mankind were led to believe that the greatest changes in the order of society might be accomplished with facility and safety.

Besides the society called the Friends of the People, other associations of less distinguished persons, called the Constitutional and Corresponding Societies, were established in London; and during the autumn societies assuming the name of Friends of the People were established in most towns and villages throughout the country, for the avowed purpose of bringing about a reform of parliament. In proportion, however, as the character of the French revolution began to display itself, in the sanguinary scenes which were daily enacted, and in the extravagant projects and sentiments which were entertained, persons of rank and property became alarmed. In the month of November an association was instituted at the Crown and Anchor tavern in London, the avowed object of which was the protection of liberty and property against the attempts of republicans and levellers; and similar associations for the support of government were set on foot in other parts of the metropolis, and throughout the country.

Parliament assembled on the 13th of December 1792. The speech from the throne intimated that his majesty

Reign of horrid massacres which took place in September, together had judged it necessary to embody a part of the militia, Reign of heorge III. with the treatment of the royal family, excited very difthat purpose; and stated, as the causes of these measures, the seditious practices which had been discovered, and the spirit of tumult and disorder, shown in acts of riot and insurrection, which required the interposition of a military force in support of the civil magistrate. His majesty asserted, that he had observed a strict neutrality in regard to the war on the Continent, and had uniformly abstained from any interference with respect to the internal affairs of France; but that it was impossible for him to see, without the most serious uneasiness, the strong and increasing indications which had appeared there of an intention to excite disturbances in other countries, to disregard the rights of neutral nations, to pursue views of conquest and aggrandisement, and to adopt towards his allies, the Statesgeneral, measures which were neither conformable to the law of nations, nor to the positive stipulations of existing treaties. Under these circumstances he felt it his duty to have recourse to the means of prevention and internal defence with which he was intrusted by law, and to take the necessary steps for augmenting the naval and military force of the kingdom.

When the usual address was moved in the House of Commons, Lord Wycombe opposed it, on the ground that the speech from the throne had calumniated the people of England; that, so far from any spirit of insurrection existing, the kingdom was on the contrary overflowing with loyalty; that speculative political opinions had always been agitated under the free constitution of Britain; and that the persons who were thought most disaffected wished merely to reform that constitution. Mr Fox declared that the present was the most momentous crisis that he had ever read of in the history of this country; and that on the conduct of parliament depended, not merely the fate of the British constitution, but that of doctrines affecting the happiness and well-being of all human kind. He affirmed, that there was not a fact stated as such in the speech from the throne which was not false; he denied the existence of any insurrection; he justified the exultation which many persons had expressed on account of the retreat of the Duke of Brunswick; he described the calling out of the militia as a fraud, intended to induce the people to believe that cause of alarm existed, and thereby to bring them more completely under the influence of government; he treated the opening of the Scheldt as no just cause of war; and he recommended the removal of acknowledged grievances, as the certain means of appeasing the discontent of the people. Mr Windham now deserted the opposition, and joined administration in contending that there existed great danger to the constitution. He also declared his approbation of the march of the combined armies into France. Mr Dundas asserted, that under the pretext of reform, the example of France had been held out for imitation to the people of this country; and that the object of the French was evidently the aggrandisement of their dominions. Mr Sheridan denied the existence of any just cause of alarm, and declared that he would vote for the impeachment of any English minister who should enter into a war for the purpose of re-establishing the former despotism in France, or who should dare, in such a cause, to spend one guinea, or shed one drop of blood. From the commencement of Mr Pitt's administration a considerable number of members of parliament, the remnant of the coalition, had remained in opposition to his measures. But in consequence of the alarm which had at this time diffused itself among persons of high rank, and perhaps also as a plausible excuse for deserting a fruitless and unprofitable opposition, a great number of the members of the party hitherto hostile to administration now joined

Reign of in supporting those measures which they perceived to be George III. agreeable to the executive power. Accordingly, on a division there appeared for the address two hundred and seventy, and for the amendment only fifty. In the House of Lords similar debates took place upon the address, and opposition also experienced a desertion of part of its members. The Duke of Norfolk, the Marquis of Lansdown, Lord Rawdon, afterwards Earl of Moira and Marquis of Hastings, and Earl Stanhope, declared themselves averse to war; whilst Lord Grenville, Lord Stormont, the Marquis Townshend, and others, supported the sentiments expressed in the king's speech.

After the French king had been dethroned, Earl Gower the British ambassador was recalled; but the French ambassador, M. Chauvelin, still continued to reside in London. On the 15th of December Mr Fox moved that a minister should be sent to Paris to treat with the provisional executive government of France; declaring, that by this motion he meant not to approve of the conduct of the French government, but simply to record it as his opinion, that it was the true policy of every nation to treat with the existing government of every other nation with which it had relative interests, without regarding how that government was constituted; and that we could have no stronger objection to the existing government of France, than to the governments of Algiers and Morocco, in both of which countries we had resident consuls. This motion gave rise to a very animated debate, in which the opposition were accused of desiring to encourage discontent and sedition, and were defended by Mr Taylor, Mr Grey, and Colonel Tarleton. But Mr Fox's motion was negatived.

On the 19th of December Lord Grenville introduced into the House of Lords what has been called the alien bill, authorizing government to dismiss from the kingdom such foreigners as they might think fit, and which passed after some opposition from the Earl of Lauderdale and the Marquis of Lansdown. On the 28th of December Mr Secretary Dundas urged the House of Commons to adopt the alien bill, on account of the extraordinary influx of foreigners into the country, and the dissatisfaction of persons at home. Sir Gilbert Elliot, in supporting the bill, expressed his regret at being under the necessity of differing from his former political associates; and Mr Burke, as usual, spoke with very great vehemence on the subject. I vote. said he, for the present bill, because I consider it as the means of saving my life, and all our lives, from the hands of assassins. When they smile, I see blood trickling down their face; I see their insidious purposes; I see that the object of all their cajoling is blood. I now warn my country to beware of those execrable philosophers, whose only object is to destroy every thing that is good here, and establish immorality and murder by precept and example. While the alien bill was under consideration, another measure allied to it in principle was introduced; namely, a bill to prevent the circulation of assignats and other paper money under the authority of France. During the month of December an order of council was also issued for preventing the exportation of corn to France, and some ships which had grain on board were compelled to unload. On the 26th of December an act of indemnity passed upon the subject.

Affairs were now fast hastening to an open rupture with France. On the 17th of December M. Chauvelin transmitted a note to Lord Grenville, one of the secretaries of state, in which, in the name of the executive council of the French republic, he demanded to know whether his Britannic majesty was to be considered as a neutral or a hostile power. No wish, he said, existed on the part of France to entertain any doubt upon the subject; and they

might be thrown out against them. With regard to the de- Reign of cree of the French convention of the 19th November, it had George III been misinterpreted. The French republic did not intend to favour insurrections in neutral or friendly states; and the decree applied only to those people who, after having acquired their liberty, might request the assistance of the French republic by a solemn and unequivocal expression of the general will. As to the neutrality of Holland, it would be respected while that power confined itself within the bounds of strict neutrality; and with regard to the opening of the Scheldt, it was a question irrevocably decided by reason and justice. It was added, that on the fatal supposition of a war being resolved on, whilst the intentions of France were thus peaceful and conciliatory, the whole weight and responsibility of it would sooner or later fall on those who had provoked it.

Lord Grenville's answer to this note, which bears date 31st December 1792, disclaimed considering M. Chauvelin in any other public character than that of minister from his most Christian majesty. It denied that the decree of the 19th November was satisfactorily explained, as the promoters of sedition in every country might still have in view the case in which they might count beforehand on the support of France. It affirmed that the neutrality of Holland had already been violated; and that the unimportance of the Scheldt would only render the opening of its navigation a clearer proof of the existence of an intention to insult the allies of England by violating their rights.

which were guarded by the faith of treaties.

An official note from the executive power of France was transmitted through M. Chauvelin in reply to Lord Grenville's answer, in which another effort was made to explain the obnoxious decree of the 19th November. In this document all intention of effecting a conquest of the Netherlands was disclaimed; and it was added, that if the Belgians, from any motive whatever, consented to deprive themselves of the navigation of the Scheldt, France would not oppose it. In an answer to this note by Lord Grenville, these explanations were declared to be unsatisfactory. On the 17th of January M. Chauvelin sent to Lord Grenville his credentials as ambassador from the French republic; but on the 20th of the same month Lord Grenville sent him a letter refusing to receive his credentials, or to consider him in any other character than as one of the mass of foreigners resident in England; and on the 24th his lordship sent M. Chauvelin a passport for himself and his suite, declaring that, after the fatal death of his most Christian majesty, he could no longer be considered as holding any public character in Britain.

In consequence of this correspondence the French convention declared war against England and Holland on the first of February; three days previous to which Mr Secretary Dundas presented to the House of Commons a message from the king, announcing that copies of the papers now mentioned were laid before the house. It was added, that his majesty thought it necessary to make a further augmentation of his forces by sea and land; and that he relied upon the zeal of the House of Commons to enable him to take the most effectual measures for maintaining the security of his dominions, supporting his allies, and opposing the ambition of France, at all times dangerous, and peculiarly so when connected with the propagation of principles utterly subversive of the peace and order of civil society. And thus Britain became a party in the most sanguinary and eventful war that ever desolated Europe or afflicted humanity. In the month of April the French government made another attempt to enter into negociations, and the minister, Le Brun, transmitted to England by a private gentleman letters to Lord Grenville, even desired to answer previously all those reproaches which in which he requested passports for M. Maret to repair

Reign of to Britain in order to negociate peace; but no public no- sibly held out to the world. It was for some time customary Reign of George III. tice whatever was taken of the application.

stility are often very different from those which are osten- cause; and the associations on the side of government

in Great Britain to dispute with great eagerness the ques-George III. tion as to who were the aggressors in this war; and in such disputes the friends of administration laboured under considerable difficulties, in consequence of the narrow ground upon which government had thought fit to rest the grounds or causes of hostility. The French government had been willing to explain away the offensive decree of the 19th November; the question about the Scheldt they were prepared to give up; and their ignorance of the nature of the British constitution, and of the elements which influence it in practice, prevented them from entertaining any idea that they were likely to encounter hostility from this country arising out of their revolution Hence they not only neglected their navy, but had already in some measure ruined it, by sending their seamen to the frontiers in the character of soldiers. But though the French had not originally entertained hostile designs against this country, and though the ostensible causes of war on the part of Great Britain were weak, if not futile, it does not therefore follow that the motives which actually influenced the conduct of the British government on this occasion partook of the same character. France had been the ancient and dangerous enemy of England. She had suddenly fallen into a state of anarchy and consequent debility. All Europe was now leagued against her. Within she was divided by faction, and without she was assailed by immense hosts of the best disciplined soldiers in Europe, conducted by the most skilful leaders, to whom she had nothing to oppose but an undisciplined multitude, led on by inexperienced chiefs. In this state of things it seemed a safe measure to make war against her. To do so was only to retaliate the conduct she had herself pursued when she effected the dismemberment of the British empire, by assisting our revolted colonies. And the moment seemed to have arrived when, by dismembering France, she might be rendered for ever incapable of becoming dangerous to Bri-

But the most powerful incitements to this war undoubtedly arose from the example of political innovation, which it was so much the interest of every government in which there existed any mixture of hereditary authority, completely to defeat and overwhelm. To comprehend the full force of this motive for going to war, it is necessary to recollect the ferment which universally prevailed in the minds of men, and to imagine the situation and the feelings of a prince, who, though still safe, yet saw in his immediate vicinity the first of European monarchs hurled from his throne to a prison, and from the prison to a scaffold, and his power assumed by subjects who represented their conduct as the triumph of reason and of freedom; while the contagion of their sentiments, extending itself into neighbouring kingdoms, threatened to break out into actions not less violent than those of the revolutionists of France. In such a state of things, and under the influence of such sentiments, a war against France seemed to be a war in defence of the whole arrangements of society; and princes and nobles considered themselves as engaged in the protection, not merely of their power and station, but even of their personal safety.

Still, however, there were not wanting at this time some individuals who thought the war altogether unnecessary for the support of the British constitution and government. The great amount of the national debt, the influence of the crown, and the general happiness and good feeling of the people at large, gave powerful assurances of stability to government and safety to property. Even before the war commenced, the crimes committed by the French re-In the quarrels of nations the real causes and motives of volutionists had greatly diminished the popularity of their

1793.

It was therefore thought by many to be perfectly practicable to weather the storm without having recourse to hostilities; and there were even some who doubted the prudence of the war, notwithstanding the strength of the combination formed against France, and suspected, that in a sanguinary and desperate contest, armies conducted by princes, brought into power by the casualty of birth, might prove no match for French enthusiasm in the first instance, and far less ultimately for the superior tactics and enterprise which must speedily be introduced by men rising to command from the admiration produced by their talents and success. Lastly, if Great Britain, instead of assailing, had actively protected the independence of France, this would have secured such an ascendency over her councils as might have enabled us to protect Holland, and to preserve the life, perhaps even the crown, of Louis XVI.; and, at all events, it would have placed us in a condition speedily to terminate the contest, without any important changes being suffered to take place in the relative strength of the continental states of Europe.

At the close of the year 1792 Mr Pitt did not attend parliament when it first assembled; nor did he make his appearance in the House of Commons till the alien bill was passing through its last stages in January, the discussion ended, and the relative strength of parties ascertained. The ostensible cause of his absence was, that having, on the death of the Earl of Guildford (Lord North), obtained the place of warden of the Cinque Ports, and thereby vacated his seat as a member of the House of Commons, he had gone down to Cambridge to secure his re-election. But the length of his absence suggested to some a suspicion that he was hesitating about engaging to support the court in its design of going to war; and in the mean time Mr Dundas stood forward in the House of Commons as the leading servant of the crown in support of the proposal for engaging in hostilities. On his return, however, Mr Pitt resumed his station in the debates of the house, and supported the measure with the utmost ardour. At this period Lord Thurlow was removed from the office of lord high chancellor, and succeeded by Lord Loughborough, who had originally owed his preferment to the support given by him to Lord North's administration and measures, and who, though hitherto an adherent of opposition, had in the recent debates defended the plans of administration.

On the occasion of a message from the king announcing the declaration of war by France, Mr Pitt stated that his majesty had always declined taking any part in regard to the internal government of France; that during the summer, while France was engaged in war with Austria and Prussia, he had in no way departed from his neutrality; but that as the French seemed now determined to subjugate other nations to their principles, he was under the necessity of interfering for the protection of his allies the Dutch, who had not indeed made any formal requisition for assistance, but to whose government the French had at all times been notoriously hostile. Mr Pitt also represented the language of the men in power in France as intolerably menacing towards the government of Britain, and as pre-eminently dangerous, from its tendency to introduce anarchy. He also adverted in strong terms to the death of the French king as a calamitous event; an outrage to every principle of religion, justice, and humanity; an act which, in this country and in the whole of Europe, had excited but one general sentiment of indignation and abhorrence, and could not fail to produce the same sentiments in every civilized nation. It was, he said, in all its circumstances, so full of grief and horror, that it must be a wish, in which all united, to tear it if possible L.6,210,000, the interest of which, to be paid by the pub-

Reign of which were forming throughout the kingdom demonstrat- from their memories, to expunge it from the page of his- Reign of George III. ed the superiority of its adherents in wealth and numbers. tory, and to remove it for ever from the observation and George III. comments of mankind. All the members who remained in opposition concurred in reprobating the conduct of the French revolutionists. Mr Fox, however, asserted, that the general maxim of policy was, that the crimes committed in one independent state could not be cognizable by another; he alleged that the topics adverted to by Mr Pitt were introduced into the debate to blind the judgment by exciting the passions; and he contended that the opening of the Scheldt, and the decree of the 19th of November, which were stated as the causes of the war, could never justify such a measure. He censured our past neutrality as unfair. While the French were invaded we remained quiet spectators; but on their becoming invaders in their turn, we said Europe was in danger, and interfered against them. He asserted that the real cause, always disavowed by our government, but ever kept in mind, was the internal government of France. The destruction of that government was the avowed object of the combined powers; but, though about to join them, we were ashamed to own that Britain was engaging to aid the restoration of despotism, and therefore the Scheldt and Holland were collusively had recourse to as pretexts. In the House of Lords, when the same subject was discussed, the Marquis of Lansdown contended, that, by sending an able and experienced minister to Paris, our government might have saved the life of Louis XVI. He declared that the war would be wanton on our part, and without provocation on the part of France; and he highly disapproved of the insulting manner in which M. Chauvelin had been dismissed.

At the period of which we are now treating, British commerce had become extremely extensive, and, owing to the commercial treaty, British and French merchants had become closely connected in their transactions. But from the sudden stagnation of trade which the war now produced, added to the alarms which had been excited upon political subjects, a sort of paralysis appeared to seize the country, and the number of bankruptcies exceeded all that had ever happened in the most calamitous times. A general stoppage of commercial credit took place, and no bank would venture to advance money to merchants or manufacturers; the consequence of which was, that many of them, with large quantities of goods in their possession, were unable to make the smallest payment. To apply a remedy to this alarming evil, several of the principal traders and merchants having waited upon Mr Pitt, requested the interference of government; and a select committee of the House of Commons was accordingly appointed to investigate the subject. After consulting with a variety of bankers, manufacturers, and merchants, the committee, on the 29th of April, gave in a report favourable to the solicitation of the merchants for relief; and a bill was introduced on the 1st of May, authorizing government to issue five millions by exchequer bills, in loans to such merchants and manufacturers as should deposit goods in security for the sum advanced. This measure proved extremely salutary. When it was found that the traders could obtain money from government, the bankers and other persons immediately evinced a willingness to advance them funds, or to give credit to their bills; trade gradually revived; and new channels were by degrees found out for the disposal of the productions of British industry.

On the 27th of March, Mr Pitt, in a committee of the House of Commons, stated, that he had borrowed for the service of the year the sum of L.4,500,000. The terms of the loan were, that for every L.72 advanced to the public the lenders should be entitled to L.100 stock, bearing an interest of three per cent., which would make a capital of .

Reign of lic, would amount to L.186,000 a year. But there was brought into parliament in the month of April for the re-Reign of appropriating a surplus million to a sinking fund, it was provided, that whenever a new loan should be made, a fund equal to one per cent. on the whole of it must be provided, and applied to the liquidation of the principal. This, therefore, required an annual charge of L.62,100, and made the whole, including interest, L.248,400 per annum.

On the 15th of March the attorney general brought forward a bill for preventing traitorous correspondence with the king's enemies. The object of this bill was to prohibit the sale to the French government or the French armies, of arms, military stores, provisions, or clothes, under the penalty of high treason. The purchase of lands in France was also prohibited. No one was allowed to go from Britain to France without a license, under the penalty of a misdemeanour; and persons, though subjects of this country, coming from France, were prohibited from entering the kingdom without a passport, or presenting to the master of the vessel a declaration that, in the mean time, they would not quit the place where they had landed without the permission of a justice of peace, or finding security for their good behaviour. Lastly, the insurance of vessels either coming from France or going thither was prohibited. And this bill passed through both houses, supported by great majorities.

During the present session a very great number of petitions were presented to the House of Commons from different parts of the country, praying for a reform in the representation; and on the 6th of May Mr Grey brought forward the question, after presenting a potition which had been framed by the association called the Friends of the People in London. He asserted that the number of petitions now brought forward demonstrated that the House of Commons were not the real representatives of the people, and he gave a detailed statement of the various defects in the representation. The proposal of reform was chiefly resisted on account of the hazard attending it from the example of France, and on account of the extent to which its more ardent partizans out of doors wished it to be carried. Mr Pitt explained his motives for being formerly friendly to a parliamentary reform, and also his objections against it at the present moment. If the principle of individual suffrage, pointed at in several of the petitions, was to be carried to its utmost extent, it would subvert the peerage and depose the king, and, in fine, extinguish every hereditary distinction and privileged order, and establish that system of equalizing anarchy announced in the code of French legislation, and attested in the blood shed in the massacres at Paris. Mr Fox, on the contrary, represented in strong terms the inconsistency of Mr Pitt's present conduct with his former professions. As to the time of attempting a reform, he said, it had been proposed at all periods, in war and in peace; but they had all been represented as improper. The present was not a more dangerous period than the year 1782, when Mr Pitt himself had brought forward a similar proposal. These dangers he ascribed to the councils, generally unwise, and often wicked, by which the country had recently been governed. Mr Grey's motion was rejected upon a division by a majority of two hundred and eighty-two against forty-

During the present session several popular measures were adopted. On the recommendation of Sir John Sinclair, L.3000 per annum was voted by the House of Commons for the establishment of a board of agriculture; an institution which has been the means of collecting and conveying to the public much useful information respecting the most valuable of all arts. On a motion by the lord advocate of Scotland, Mr Robert Dundas, a bill was

George III. another charge attending the loan; for by the act for lief of the Roman Catholics of Scotland. The persons of George III. that proscribed sect were still incapacitated by law from holding or transmitting landed property, and were liable to other severe restrictions; but these were removed by a bill which now passed without opposition. The passing of this bill was a popular measure, although a dozen years had scarcely elapsed since the people of Scotland had almost universally, and with the utmost violence, combined to oppose any relaxation of the penal laws affecting the Catholics. By the assistance of Mr Dundas, the inhabitants of the north of Scotland also obtained a repeal of the duty on coals carried coastwise, as far as respected that part of Great Britain; but the cities of London and Westminster were less fortunate in an attempt to procure a repeal of the taxes paid by them on the same article.

At this period the exclusive charter of the East India Company being within a year of its expiration, that body presented a petition for a renewal of it; and on the 23d of April the subject was considered in the House of Commons. Mr Dundas observed that the proposal which he was about to make of a renewal of the charter was undoubtedly attended with difficulties. No writer upon political economy had as yet supposed that an extensive empire could be administered by a commercial association; and no writer on commerce had thought that trade ought to be shackled with exclusive privileges. In deviating from these principles, which had been admitted and admired, he was sensible that his opinions had popular prejudices against them; but he was supported by successful experience; and when the house adverted to the peculiarities of the subject before them, they would at once see that he was not attempting to overturn theories, though he was unwilling to recede from old and established practice. It would be idle, and a proof of ignorance, to maintain that all the advantages which Great Britain possessed from its connection with India arose out of the present exclusive privilege of the Company; but it would be impossible to say what might be the political or commercial effects of a deviation from the present system. He then stated, that the shipping employed by the East India Company amounted to eighty-one thousand tons; that the seamen navigating those ships were about seven thousand men, who had constant employment; that the raw materials imported from India for the use of home manufactures amounted annually to about L.700,000; that the annual exports of British produce and manufacture to India and China in the Company's ships amounted to upwards of a million and a half sterling; and that great difficulties would attend any alteration of the present system of government in India, especially from the effects which the innovation might produce on the minds of the natives. He therefore proposed a variety of resolutions, the most material of which was, that it appeared fit and proper to continue to the East India Company their exclusive trade, within the limits now enjoyed by them, for a further term of twenty years, to be computed from the 1st of March 1794, but liable to be discontinued at the end of such a period, if three years' notice should previously be given by parliament. The resolutions proposed by Mr Dundas having been carried, a bill for renewing the East India Company's charter was brought in, and passed through both houses with little opposition. The trial of Mr Hastings still proceeded, though very slowly. It was now totally disregarded by the public.

During this year government sought to strengthen itself by erecting barracks in the vicinity of the great towns, in order that, by residing apart from the citizens, the soldiers might be removed beyond the contagion of popular opinions. But a considerable degree of political fermentation still prevailed in the minds of the people. In Eng-

George III prisonment, for selling the second part of Paine's Rights of Man; and one or two individuals of humble rank were committed for seditious publications. In Scotland the public attention was much excited by the prosecution of two gentlemen, Mr Thomas Muir of Hunter's Hill, a member of the faculty of advocates; and Mr Fysche Palmer, a member of the university of Cambridge, who officiated as unitarian minister at Dundee. Mr Muir had been extremely active during the autumn of the preceding year, when the political agitation was at its height, in promoting associations in Glasgow and its neighbourhood, for the purpose of procuring a reform of the representation in the House of Commons. In point of talents he was not above mediocrity, but he possessed the faculty of unpremeditated elocution in a surprising degree, and appeared to be actuated by the vanity of haranguing without end, which the daily meetings of these societies afforded him an opportunity of gratifying. In other respects he was not formidable, possessing little knowledge of the world, and still less discernment of the human character. He injured the cause which he meant to promote, by collecting assemblages of people, first at Glasgow, and afterwards at Edinburgh, and thus creating an appearance of disorder and turbulence, which alarmed the government, and intimidated persons who were otherwise disposed to favour the political sentiments which he professed. Mr Palmer was a man of eminent literary talents, and attended political societies, but without making any remarkable efforts to distinguish himself in these assemblages. He was tried before the circuit court of justiciary at Perth, on the 17th of September, some months after Mr Muir's conviction at Edinburgh, and found guilty of publishing a political libel, which had been written by some other person, but which he had corrected and ordered to be printed. Both of these gentlemen were sentenced to transportation, Mr Muir for fourteen, and Mr Palmer for seven years; and they were accordingly shipped off, among common felons, for Botany Bay. The disproportionate severity of these sentences excited general sympathy, and produced considerable discussion. The crime of which they were convicted was that of sedition or leasing-making, which by the law of Scotland is is a rule in law, that penal statutes are to be strictly interpreted, it was doubted how far the punishment of transportation could be inflicted under a statute which points out, in general terms, banishment as the punishment of the offence. Not intimidated by these trials, a few persons of no public or political importance whatever met at Edinburgh in the month of November, and thought fit to call themselves a British Convention. They mimicked the proceedings of the French national convention as closely as possible, saluting each other with the title of citizen, holding public sittings, admitting strangers to the honours of the sittings, and mingling the solemn with the ludicrous in a singular style. At any other period their conduct would have excited nothing but ridicule; at this time it was considered in another light, for some of the members were brought to trial, and punished with the same severity which had been exercised towards Messrs Muir and Palmer.

To promote the success of the war, a convention had of Petersburg, stipulating for the prosecution of hostilities till the French relinquished all their conquests. A treaty was soon afterwards entered into with the landgrave of Hesse Cassel, for a subsidiary body of eight thousand men, which, by a subsequent agreement, was extended to twelve thousand; and the king of Sardinia engaged, for L.200,000

Reign of land, a bookseller was prosecuted, and punished with im- in general service against the enemy. Compacts of alliance Reign of were also adjusted with Spain, Naples, Prussia, Austria, and George IIL Portugal; and besides the stipulation of vigorous hostility, it was agreed that the conduct of other powers should be watched with extraordinary circumspection, lest they should abuse their professed neutrality by protecting the

commerce or property of the French.

The detail of the military transactions of this eventful contest will be given under another head. But we may observe here, that during the present campaign the independence of France seemed at one time to be in considerable hazard. The faction which had overturned the monarchy, assembled a convention of national representatives, and endeavoured to establish a republican form of government, soon divided itself into two parties, those of the Gironde and the Mountain. The leading party, when the republic was first proclaimed, consisted chiefly of men of letters, who were led by speculative considerations to expect a wonderful amelioration of the human character, and of the state of society, from the changes they were producing. They wished to avoid sanguinary measures at home, and to restore tranquillity to their country as speedily as possible; but being equally deficient in energy and in knowledge of the character of their countrymen, they were successfully opposed by a turbulent and ferocious minority, led by Robespierre, Danton, and other men of the most unprincipled and sanguinary temper. The moderate and ruling party were also deceived by many of those whom they had employed; and at last their favourite commander, Dumouriez, having been repulsed in the Netherlands by the united forces of Austria, Prussia, and England, entered into a negociation with these powers for the restoration of monarchy in France. But the treacherous project was rendered abortive by the fidelity of his army, which almost to a man deserted their general, and refused to bring the independence of their country into hazard by allowing foreign armies to interfere in the arrangement of its internal government. The defection of Dumouriez, together with the repulse of their armies, brought the moderate party. which still ruled in the French convention, into great difficulties; and it is an unfortunate circumstance that the British government did not then seize the opportunity of makpunishable by fine, imprisonment, or banishment; but as it ing peace with them. The hazard of innovation was now past. One of the maxims of the first French republicans was the love of peace and hatred of war; and the unsuccessful issue of the attempt made to penetrate into other countries must have added force to this sentiment. The tranquillity of Europe might thus have been insured; a mild party would have been preserved in power; Great Britain might have obtained an influence over their councils; and the sanguinary scenes which afterwards occurred in the interior of France, and upon the frontiers, might have been prevented. But this opportunity was unhappily disregarded; and from the distraction within, and the immense combination of force assailing France from without, the complete subjugation of that country was confidently anticipated. Meanwhile the failure of the military operations of the Girondists encouraged the wild party to attempt the overthrow of the more moderate French republicans, by exciting an insurrection of the populace in Paris; an attempt which unhappily proved but too successful. The been concluded in the spring between our court and that national representatives were subdued, ninety members of the convention were imprisoned, and the minority were enabled to convert themselves into an apparent majority. By this event all France was thrown into confusion. The authority of the convention, thus impaired, was utterly rejected by the south of France; and the town and harbour of Toulon, with its fleet and stores, were surrendered by per annum, to keep up an army of fifty thousand men, to be negociation to the British admiral, Lord Hood, as trustee employed in the particular defence of his dominions, and for the next heir of the monarchy. In the western parts of

France the standard of royalty was reared, and joined by measures. But Lord Mornington, on the other hand, con-Reign of George III. immense multitudes, who adhered to it with the most obstinate bravery, and were not subdued till after a greater expenditure of blood than was found necessary for the repulse of the combined armies of Europe.

On the part of Britain the general plan of the war does not seem to have been well contrived or properly carried into effect. A great part of the western coast of France was in full possession of the royalists, whilst the British navy at the same time commanded the ocean. It would therefore have been comparatively an easy enterprise to land an army on the French coast for the assistance of the royalists, and to advance through an open country, destitute of fortified towns, to the capital, and against a convention whose authority was scarcely acknowledged by a third part of the nation. Instead of this, the combined armies were directed against the French Netherlands, where they wasted the summer, as well as their own strength, in the siege of a few of the fortresses which defend that frontier; and thus the attack upon France was made upon its strongest side, at a distance from the centre of its power, and where the means of protracted resistance were the greatest; whilst leisure was afforded to the convention to establish its authority, to call out immense levies for the defence of the country, and before the close of the year to turn the tide of success in its favour. Toulon was retaken under the masterly direction of Bonaparte, who then first appeared on the revolutionary stage; and the Spaniards were beaten in the south; whilst, on the northern frontier, the British army was repulsed before Dunkirk, and the commander in chief of the allies, the prince of Cobourg, before Maubeuge. The Duke of Brunswick and General Wurmser were also driven across the Upper Rhine near Mentz, in the last two weeks of the year, after a succession of sanguinary conflicts, in which the French, by daily bringing forward fresh troops, at last succeeded with their raw levies in wearing down the strength and the courage of their veteran enemies.

The British parliament assembled on the first of January 1794. In the speech from the throne his majesty called the attention of the two houses to the issue of the war, " on which depended the support of our constitution, laws, and religion, and the security of all civil society;" to the advantages which had attended our arms both by sea and land; and to the expectation of ultimate success, founded on the circumstance that the efforts of the enemy, proceeding on an arbitrary system, which enabled them unjustly to dispose of the lives and properties of the people, must eventually introduce internal discontent and confusion. His majesty further stated the impossibility of making peace consistently with the permanent safety of the country, and the tranquillity of other nations; he noticed the treaties and conventions into which he had entered with foreign powers; and he mentioned the general loyalty which prevailed amongst all ranks, notwithstanding continued ef-

forts to mislead and seduce the people.

As usual, the topics introduced into the king's speech became the subject of debate, both in the House of Lords and in the House of Commons; but they excited little attention throughout the nation. Men of property were generally so much alarmed by the events which had occurred in France, that they reposed implicit confidence in the government; and as administration seemed resolved not to despair of success, they derived great support from the approbation of the public. A minority, indeed, existed throughout the country, by whom the war was openly disapproved of; but as they consisted in general of persons of little influence, they were unable seriously to embarrass the measures of administration. When the king's speech was taken into consideration, Lord Wycombe moved an amendment to the address, recommending pacific

tended that the alternative of war or peace did not at George III present exist. Before we could relinquish the principles on which the war had commenced, proof was necessary either that the opinions which we had conceived of the views of France were erroneous, that the war had become desperate and impracticable, or that, from some improvement in the system and principles of the French, the necessity which had prompted us to commence the war no longer existed. Nothing of this sort had occurred. France entertained unlimited views of aggrandizement and ambition, connected with principles subversive of all regular government. Mr Sheridan entirely dissented from these views, and affirmed that Britain had acted with as little regard to the independence of neutral states as the French; that she had endeavoured to compel Genoa, Switzerland, and Tuscany, to join the confederacy against France, by the most insulting menaces; and that, as far as prudence would permit, she had assumed the same language towards Sweden and Denmark. If the French system of fraternization with other nations who wished to overturn their own internal government formed a just cause of war, their dereliction of that system ought to be a reason for making peace. He denied that the French were the original aggressors. I am astonished, said he, that the minister who sits near the Noble Lord does not himself feel it necessary to his own dignity to oppose this paltry argument of the act of aggression having come from them, instead of leaving that task to us, to whom comparatively the fact is indifferent. When he hears this called a war of necessity and defence, I wonder he does not feel ashamed of the meanness which it spreads over the whole of his cause, and the contradiction which it throws among the greater part of his arguments. Will he meet the matter fairly? Will he answer this one question distinctly? If France had abstained from any act of aggression against Great Britain and her ally Holland, should we have remained inactive spectators of the last campaign, idle, apart, and listening to the fray, and left the contest to Austria and Prussia, and whatever allies they could themselves have obtained? Does he then mean to say that he would have sat still; that Great Britain would have sat still with arms folded, and, reclining with luxurious ease on her commercial couch, have remained an unconcerned spectator of this mighty conflict, and have left the cause of civil order, government, morality, and religion, and its God, to take care of itself, or to owe its preservation to the mercenary exertions of German and Hungarian barbarians; provided only that France had not implicated Great Britain by a special offence, and forced us into this cause of divine and universal interest by the petty motive of a personal provocation? Mr Sheridan admitted that enormities had been committed in France, which disgusted and sickened the soul. This was most true; but what relation had these to England? And if they had, what did it prove? What, but the eternal and unalterable truth, that a long-established despotism had so far degraded and debased human nature, as to render its subjects, on the first recovery of their rights, unfit for the exercise of them? That we and all the powers of Europe had reason to dread the madness of the French, he agreed; but was this difficulty not to be accounted for? Wild and unsettled as they must necessarily be from the possession of such power, the surrounding states had goaded them into a paroxysm of madness, fury, and desperation. We called them monsters, and hunted them as monsters. The conspiracy of Pilnitz, and the brutal threats of the abettors of that plot, had to answer for all the additional horrors that had since disgraced humanity. We had covenanted for their extermination, and now complained that they turned upon

George III. hope of success existed upon which we ought to proceed. What was the state of our allies when we entered into the confederacy? The force of Austria unbroken, though compelled to abandon Brabant, and the power of the veteran troops of Prussia absolutely untried, though the seasous and disease had induced them to retire from Champagne. What was their state now? Defeat had thinned their ranks, and disgrace had broken their spirit. They had been driven across the Rhine by French recruits, like sheep before a lion's whelp, and that not after the mishap of a single great action lost, but after a succession of bloody contests of unprecedented fury and obstinacy. Where now was the scientific confidence with which we were taught to regard the efforts of discipline and experience, when opposed to an untrained multitude and unpractised generals? The jargon of professional pedantry was mute, and the plain sense of man was left to its own course. Mr Windham combated the opinion, that the enormities committed in France were the effects of the war. Mr Dundas defended the management of the war, and the activity which had been employed by government in conducting it. Our seamen in the beginning of the year were only fifteen thousand; in the course of the war fifty-four thousand men had been added. At the commencement of the war we had only thirteen ships of the line and thirty frigates fit for service; at the present time we had eighty ships of the line and a hundred frigates in actual employment, which, with the armed vessels now in the service of the public, made the whole above three hundred sail. In augmenting the army, the most effectual and economical system had been pursued; besides the militia, thirty thousand men had been added to the army. Mr Fox repeated that we were the aggressors in the war; contended that every state had a full right to regulate its internal government; and asserted, that the manifesto of the Duke of Brunswick had occasioned all the excesses of the French. He denied that the prodigal manner in which the French government conducted their affairs, and the confusion and ruin into which their finances were hastening, afforded any prospect of success to the allied powers. He remembered, that during the American war there was much talk of a vagrant congress, which was nowhere to be found, of their miserable resources, and their wretched paper money at three hundred per cent. discount, of which, with any few halfpence you had in your pocket, you might purchase to the amount of a hundred dollars. The Americans were represented as exercising on each other the most intolerable tyranny, on the royalists the most unheard-of cruelty; and it was then said, that if such principles were suffered to exist, if the cause of America were ultimately successful, there was an end of all civilised government, and England must be trodden in the dust. Yet then, said this statesman, I recommended negociation, and lived to see Great Britain treat with that very congress so often vilified and abused, and the monarchy remain in sufficient vigour. Mr Pitt recapitulated the arguments formerly employed to prove that the aggression had certainly taken place on the part of France. The system adopted by the French, their usurpation of foreign territory, their hostile intentions against Holland, and their unprecedented views of aggrandisement and ambition, were subversive of all regular government; and unless it could be proved that we had mistaken these principles, we were bound to continue the war, even supposing that difficulty and disappointment. had occurred in the prosecution of it. He conceived there was not the least probability of the continuance of the present government of France. The efforts of the people had been merely the result of terror, and were supported by desperate resources, which could not possibly continue.

Reign of us with the fury which we had inspired. No reasonable He admitted that a safe and advantageous peace ought to Reign of be concluded, as soon as it could possibly be obtained; but George III. the security and benefits of peace with France must depend upon the establishment of a government essentially different from the present. After a lengthened discussion, the address was carried by an overwhelming majority. In the House of Lords a similar debate took place, and similar arguments and views were respectively urged by the adverse parties; but ultimately the address was carried by a majority as decisive as that in the Commons.

It is one of the characteristics of the British nation, to be at all times easily thrown into a state of anxiety and alarm, by any object which government for the time thinks fit to represent as dangerous. The two greatest objects of political terror to Englishmen have at all times been the fear of a foreign invasion, and the dread of secret conspiracies by a disaffected party. During many ages Britain has not been successfully invaded; and, since the time of the Spanish Armada, no such attempt has been made by any of those governments with which Britain has engaged in hostility; but this circumstance, which leads reflecting persons to regard such a project as extremely unlikely to occur, seems to produce a contrary effect upon the people at large. The evils attending invasion having never been felt, lay hold of their imaginations, in the wildest and most exaggerated forms; and from the terror thus produced, they are prevented from reflecting upon the difficulties attending the project, which deterred Louis XIV. from attempting it while in the height of his power, and with the advantage of a disputed succession to the crown. Yet such is the credulity of the British nation upon this head, that administration can at any time throw them into a state of the utmost consternation, by expressing an apprehension of a French invasion; and from this apprehension ministers usually derive very considerable advantages. The voice of faction is for a time silenced by patriotic terror, and all parties hasten to arrange themselves under the banners of government for the defence of their country. The dread of plots and conspiracies produces effects somewhat similar. It is true that no conspiracy of Englishmen was ever productive of danger to the government whilst it remained even tolerably popular; but this never prevents the nation from being thrown into consternation, by intimations, on the part of government, that some desperate conspiracy is secretly carrying on, and ready to burst forth, to the utter destruction of the public tranquillity.

During the war of which we are now treating, Mr Pitt's administration derived incredible strength from these two sources of terror; the fear of invasion, and the dread of conspiracies by disaffected persons. Nor did he want skill to profit by them. At the commencement of the war it had been believed by most persons, and perhaps by government, that it would be of short duration, the state of anarchy which succeeded the overthrow of the monarchy in France seeming to render that country an easy prey to the powerful armies by which it was invaded; and when any doubt of success was expressed, it was answered, that after making trial of the war for a year, we might desist in case we were unsuccessful. But although the original state of affairs had been considerably altered by the successes of the French, yet the British government still resolved to persist in the war, which, however, was now daily becoming less popular. On the other hand, the French leaders were greatly irritated by the persevering hostility of the British ministry, and in the pride of victory menaced England with invasion. It is evident that they had still too much business upon their hands on the Continent to be able to make the slightest attempt to carry their threats into execution; but the British administration, taking advantage

Reign of of the threat, expressed their fears that it might be suc- ing the resistance of a party in Poland, headed by the Reign of lunteers, both cavalry and infantry, throughout the island, for the defence of the nation against foreign invasion, and the efforts of disaffected persons at home. They also en-couraged the raising of subscriptions to defray the expense of these armed associations; and although the measure was disapproved by the minority in parliament, as an unconstitutional mode of raising money, it was supported by the majority. An act was passed authorizing the embodying and training of volunteers, and the measure was carried to a considerable extent throughout the country. In like manner, though the political ferment occasioned by the French revolution had now considerably subsided, administration, aware of the strength derived from keeping the country in a state of anxiety upon political subseditious practices had been carried on by certain societies in London, with a view to overturn the constitution, and introduce the system of anarchy which prevailed in France; and that their papers had been seized, and were submitted to the consideration of the house. On the same day Thomas Hardie, a shoemaker in Piccadilly, who had acted as secretary to the London Corresponding Society, and Daniel Adams, the secretary to the Society for Constitutional Information, were apprehended for treasonable practices, upon a warrant from Mr Dundas. Mr Horne Tooke, well known for his ingenious philological writings, as well as for the political part he had formerly acted in the turbulent days of Wilkes, the Reverend Mr Jeremiah Joyce, Mr Holcroft a dramatic writer, Mr Kyd a barrister, and Mr John Thelwall, who had for some time entertained the town in the character of political lecturer, were also in a few days arrested and committed to the Tower on a charge of high treason.

For the sake of giving solemnity to the inquiries made Commons was chosen by ballot, the members of which were the friends of the minister. The report of the committee concerning the alleged conspiracy amounted to little more than a recital of a number of advertisements from societies, or accounts of their debates, which had served as a pretext for suspending the Habeas Corpus act, and thereby enabling ministers to prevent any political movement, or avowed disapprobation of their measures, from being rashly exhibited out of parliament. In the meanwhile the dread of invasion, added to the political alarm which had previously diffused itself throughout the country, and which was thus artfully maintained, conferred upon ministers a degree of strength which, for a century and more, no British administration had possessed. Almost all men of property were their adherents; whilst their antagonists sunk into utter discredit, and suffered a species of persecution in every department of society; so that it became dangerous to a man's prospects in the world, and in ordinary business, to express the slightest doubt of the propriety of any measure approved by government.

In the early part of his administration, Mr Pitt had endeavoured to rest his reputation, in a considerable degree, upon the improvement of the finances, and the hope which he held out of paying off the national debt. He now deserted all such views; and taking advantage of the uncontrolled power he possessed at home, and the pliability of parliament, he engaged in a career of unexampled expenditure, in corrupting successive parties in France, or in the management of the war.

From its first rise to eminence as a European power, Prussia considered France as its protector against the ambition of Austria. During the present year, notwithstand-

George III. cessful; and proposed the arming of associations of vo- brave Kosciusko, that country was partitioned, and Prus-George III. sia obtained an ample share of its territory. But the partition of France was an object from which Prussia had every thing to fear, as it would destroy the only power by which Austria, the inveterate enemy of Prussia, had at all times been kept in awe. When the Prussian monarch found it necessary, in conjunction with his allies, to invade France in 1792, he retired upon the first appearance of a tolerably firm opposition, and gave the republic a respite of another winter, during which to arrange its strength, and call into action its resources. In the year 1793 the Prussians remained extremely inactive till towards the close of the campaign, when at last, in consequence of repeated remonstrances from their allies, they advanced against Alsace; but being there repulsed, and jects, announced to parliament, by a royal message, that the republic beginning to exhibit on all sides a firm military front, the king of Prussia declared that the expenses of the war were more than his finances could sustain, and required the other German states to supply him with money, threatening in case of refusal to abandon the common cause; and on their declining to comply with his demands, he actually began to withdraw his troops. But by this time the British ministry had engaged in the war with a degree of eagerness which induced them to make every sacrifice to obtain success; and therefore, to avoid losing the assistance of Prussia, they offered a subsidy, which was finally adjusted, upon the condition that his Prussian majesty was to furnish sixty-two thousand troops, or thirty thousand beyond his contingent; for which his Britannic majesty was to pay him L.50,000 a month, L.100,000 a month for forage, L.400,000 to put the army in motion, and L.100,000 on their return, or in all, for the remaining nine months of the year, L.1,350,000. At this rate the expense of the whole year would amount to L.1,800,000, of which the states general were to pay into this conspiracy, a secret committee of the House of L.400,000; and the forces thus subsidized were to be commanded by an officer to be named by the king of Prussia. By this treaty the king of Prussia was enabled to keep his army upon the war establishment with little additional expense to himself, and with the power of claiming a share of whatever conquests were made from France; previously been inserted in the public newspapers; but it whilst, by retaining the appointment of the general of the subsidized army, he preserved a complete command over it, and might prevent his troops from being worn out by active service, or restrain them from doing greater injury to the French republic than he should judge prudent or expedient in the circumstances.

> All Europe looked forward with great anxiety to the approaching campaign as decisive of the contest; in which its whole powers, excepting Russia, Sweden, and Denmark, were actively engaged. At sea, where her strength could be most effectually exerted, Great Britain was eminently successful. An expedition under Sir Charles Grey and Sir John Jervis was sent to the West Indies, where Martinique, St Lucie, and other islands, were taken. In the Mediterranean the French were driven from the island of Corsica, and the inhabitants acknowledged the king of Great Britain as their sovereign. But the most signal victory was that gained by Lord Howe over the French fleet on the first of June near Brest. During the first years of the revolution France had suffered much distress from a scarcity of grain; and such was the inveteracy with which the present war was conducted, that the British government had formed a plan of subduing that nation by famine, by preventing their obtaining supplies of provisions from any foreign country. In their distress the French rulers had applied for assistance to the United States of America, which still owed a considerable debt to France, contracted during the war by which their own re-

George III. accept payment of this debt in corn, a commodity abounding in America. The Americans, accordingly, delivered the grain in their own ports, and a hundred and sixty sail of vessels laden with grain set out for France. As soon as this became known, Lord Howe was dispatched, in order, if possible, to intercept this valuable convoy; while the French admiral, Villaret-Joyeuse, sailed from Brest to hazard an engagement with the British fleet, for the sake of preserving the convoy. The force of the hostile fleets French twenty-five sail of the line; but the French line their ships were taken, and two sunk. Before the battle, however, the French admiral had detached a considerable force for the protection of the convoy, which was thus enabled with safety to reach its destined port. This victory produced very great exultation in Britain; and the fear of invasion which had been previously excited was abated

by so decided a proof of naval superiority.

On the part of the French, however, these colonial and freedom or independence. naval losses were greatly overbalanced by the general result of the campaign. The allies still concentrated their sia perceiving France restored to more than her ancient principal force against the Netherlands, and with that view, at the commencement of the campaign besieged and took Landrecies; but the fortune of the war was speedily changed. General Pichegru advanced into maritime Flanders, and in a variety of engagements defeated Count Clairfayt, an Austrian general of great activity, who ruined his army by incessant and sanguinary efforts to drive back a superior enemy. An attempt made by the grand army to cut off the retreat of Pichegru proved unsuccessful; and the latter having in turn manœuvred to intercept the communication of the imperialists with their magazines at Ghent, was in like manner repulsed; but the obstinate conflict which he maintained, and the steady fire of his troops, during a succession of conflicts, which lasted from daybreak till sunset, convinced the allied armies that the invasion of France had become a hopeless project. At last the French advanced, under General Jourdan, from the eastward, and at Fleurus gained a victory which cost the Austrians nearly fifteen thousand of their best troops. Mutual disgust, as well as discouragement, now prevailed among the allies. The Austrians retreated, leaving the Duke of York at the head of the British and Hanoverian forces in considerable peril; but, with the assistance of the Earl of Moira, his royal highness made good his retreat. This nobleman, who had distinguished himself in the American war, was opposed to the present war, which he had reprobated in his place in parliament. But having nevertheless been sent by administration with a feeble armament to assist the royalists on the western coast of France, and finding himself too weak to effect any thing of importance in that quarter, he had brought back his troops; and was afterwards sent with them to defend Ostend, where, learning the difficult nature of the Duke of York's situation, and perceiving that Ostend could not long be protected after the rest of Flanders had been deserted, he marched across the country, and in the face of much danger, and under great hardships, effected a junction with the principal British army, to which this reinforcement afforded seasonable aid.

The French were no less successful on the Upper Rhine, and on the frontiers of Italy and of Spain. At the end of the campaign, an intense frost having set in, they reinforced their armies, and Pichegru invaded Holland. After a variety of engagements the British and Hanoverians, together with some Austrian auxiliaries, whom Britain had subsidized, were repulsed, and found it necessary to abandon Holland to its fate. Many Dutch families sought and Mr Vicary Gibbs, and the prosecution was conducted

Reign of volution had been accomplished; and they now offered to refuge in Britain. When Utrecht had submitted to the Reign of enemy, the stadtholder, knowing that Amsterdam would George IIL not be defended, left his country, and escaped in a fishingboat to England, where he and his family became immediate objects of royal liberality, and were treated with the respect due to their rank and misfortunes. The Dutch, who had viewed the English with a very unfriendly eye since the revolution of 1787, appeared to be highly pleased with this change in their affairs. They had treated our soldiers with great illiberality, and refused to alleviate by was nearly equal, the British having twenty-six, and the kindness or compassion the sufferings of the wounded, or the distress of the fugitives, who at length effected their was broken, and, after an obstinate engagement, six of retreat to Bremen, after a long and severe trial of their patience and fortitude. The United Provinces were now revolutionized on the French model. Liberty, equality, and the rights of man, were proclaimed; representatives of the people were chosen; and the regenerated state was named the Batavian Republic. But the pretended friends of the Hollanders, in rescuing them from what they termed a disgraceful yoke, did not suffer them to enjoy real

1794.

energy, and capable of humbling his enemy and her ancient rival, the house of Austria, deserted the coalition, refused to accept of any further subsidy from Britain, and took under his protection, as neutral states, the whole princes of the north-west of Germany; thus becoming the ostensible head and guardian of a large division of the empire, which was enabled to recover its tranquillity, and to become a calm spectator of the prolonged contest, which the rest of the empire under Austria continued to carry on against France. Spain was also under the necessity of imitating the example of Prussia, though upon less favourable terms, being constrained to relinquish, as the price of peace, her half of the island of St Domingo; and the Duke of Tuscany also deserted a contest in which he

had reluctantly engaged.

In the meanwhile administration pursued their system of alarming the friends of internal tranquillity, by the dread of conspiracies and attempts against the constitution. The persons who in the month of May had been imprisoned on a charge of high treason were brought to trial in the end of October. The first was Thomas Hardie. His indictment stated nine overt acts of high treason; first, forming an intention of exciting rebellion and insurrection, and conspiring to subvert the government and depose the king; secondly, writing various books, pamphlets, letters, and addresses, recommending delegates to a convention; thirdly, consulting as to the means of forming such a convention; fourthly, agreeing to form themselves into a society for the purposes aforesaid; fifthly, causing arms to be made in order to subvert the government and depose the king; sixthly, conspiring to levy war within the realm; seventhly, conspiring to aid the king's enemies; eighthly, composing and publishing certain books, pamphlets, letters, exhortations, and addresses, for the purposes aforesaid; and, lastly, procuring arms for the purpose of levying war against the king, and exciting rebellion and insurrection. The written evidence consisted chiefly of advertisements and addresses, published in the newspapers, many of which were expressed in a very intemperate style; and of the proceedings of the societies, which were all public. With regard to the alleged charge about arming the people, it appears to rest upon no solid foundation; and the accusation and defence, therefore, turned chiefly upon the question of treasonable intention upon the part of the accused and his associates. Hardie was ably defended by the Honourable Thomas Erskine

Reign of by the attorney and solicitor general; but after the pro- tention to so riciculous a story as this; but such is the well- Reign of George III. ceedings had been protracted to the eighth day, the jury, after some deliberation, brought in a verdict of not guilty. The next trial was that of Mr Horne Tooke, who endeavoured to prove that he had merely followed the example of Mr Pitt, in recommending a plan of parliamentary reform. The minister was examined on the occasion, chiefly regarding the proceedings of the popular party, before the close of the American war, with a view to establish this point; but he evaded most of the questions by alleging a want of recollection. The acquittal of Mr Tooke was followed by that of Mr Thelwall; and a despair of convicting any one of the supposed traitors led to the abandonment of the other indictments.

these persons, which tended to discredit the alarms kept up by the friends of administration, was felt by them as an additional misfortune. Had the indictments been laid for sedition only, the prosecutions would probably have proved successful; but ministers were led to carry matters the length of an accusation of treason, by their success in a similar charge at Edinburgh in the preceding month of September, against two persons named Robert Watt and David Downie. Watt had been a spy, employed by government to attend political societies, and discover the designs of the leaders; but as he was a needy person, and had been unable to communicate intelligence of much importance, he had received little pay. To earn more money, he thought fit to contrive a plot, which he communicated to Downie and some others, for seizing the castle and the public offices at Edinburgh, with a view no doubt of afterwards holding out his associates to government as criminals. Neither he nor they had any means of carrying such a plan into effect. But Watt having procured some pikes, deposited them in a cellar in his own house, where they were accidentally discovered; the spy was apprehended; and the persons to whom he had communicated his plan having come forward as witnesses against him and Downie, they were both found guilty of high treason. Downie, who had done little more than appear to approve of Watt's plan, was recommended to mercy, and afterwards pardoned; but Watt was executed.

Another source of encouragement to proceed with measures of severity arose at this time out of a plot brought to light by some informers, and by way of ridicule termed the Pop-gun Plot. The persons implicated in this charge were, John Peter Le Maitre, a native of Jersey, and apprentice to a watch-case-maker in Denmark Street, St Giles; William Higgins, apprentice to a chemist in Fleetmarket; and a man of the name of Smith, who kept a book stall in the neighbourhood of Lincoln's-inn. Their accuser was one Upton, an apprentice or journeyman to a watchmaker. Le Maitre, Higgins, and Smith, were apprehended on Saturday the 27th of September, by a warrant from the Duke of Portland, as secretary of state, and examined on Sunday the 28th, before the privy-council, the lords of which were summoned again to attend on Tuesday upon the same important business. The charge, supported by the testimony of Upton, bore in substance, that an instrument was to have been constructed by the informer Upton, in the form of a walking stick, in which was to have been inserted a brass tube of two feet long; that through this tube a poisoned dart or arrow was to have been blown by the breath of the conspirator Le Maitre at his majesty, either on the terrace at Windsor, or in the playhouse; and that the poison was to have been of so subtle a nature, that if the point but glanced upon the king, it would produce instantaneous death. Nothing short of the most consummate ignorance of the state of human science could, on any ordinary occasion, have procured a moment's at-

known credulity of the English nation regarding political George IIL dangers, that administration and their friends appear to have regarded this plot as an affair of some importance.

Parliament assembled on the 30th of December. In the speech from the throne his majesty urged the necessity of persisting in the war, however unfortunate it had been; and noticed the rapid decay of the resources of the The Dutch had, he observed, from a sense of present difficulties, entered into a negociation for peace with the prevailing party in France; but no established government could derive security from such a negociation. The most effectual means had therefore been employed for the further augmentation of the forces, on whose va-As the war was becoming unpopular, the acquittal of lour, as well as on the public spirit of the people, he placed the utmost reliance. This speech also mentioned the accession of the sovereignty of Corsica to the British dominions; a treaty of amity and commerce with America; and the conclusion of a treaty of marriage between the Prince of Wales and the Princess Caroline of Brunswick.

When an address to his majesty in similar terms with the speech was moved in common form, very animated debates took place in both houses of parliament. The war was attacked and defended upon the usual grounds, with this additional circumstance, that the events of the late campaign gave considerable countenance to the assertions of opposition, that all hope of ultimate success was irrational. Administration, however, were no less powerful than formerly. On the last day of the preceding session they had received into official situations some of those supporters of the war who in former years had opposed their measures. Earl Fitzwilliam had been appointed president of the council; the Duke of Portland became one of the secretaries of state; Earl Spencer was declared keeper of the privy seal; and Mr Windham was appointed secretary at war. But notwithstanding these official changes, Mr Pitt, with the aid of his friend Mr Dundas, and his relation Lord Grenville, was understood to retain the efficient power of the state. Mr Dundas still retained the management of the war with France; and, as a kind of third secretary of state, he performed a considerable part of the business which would otherwise have devolved upon the Duke of Portland; while at the same time he continued, as president of the board of control, to superintend the affairs of India, and to hold the office of treasurer of the navy. Earl Fitzwilliam was soon got quit of, being sent to Ireland as lord-lieutenant, under an agreement that he was to have full power to promote the repeal of the penal statutes against the Catholics, and to concede certain privileges which had been withheld in 1793. But ministers having altered their sentiments about some of these points, prohibited him from proceeding; and as he insisted upon the terms on which he had accepted his situation, he was recalled and dismissed from office. By joining ministers for a time, he was prevented from acting along with opposition in reprobating the war, and thus he was left insulated and separated from both parties.

Among the debates of the present session, one of the most remarkable was that which occurred upon the motion of Mr Grey in the House of Commons on the 26th of January 1795, that the existence of the actual government of France ought not to be considered as precluding a negociation for peace. After two years of war, which had drained this country of its blood and treasures, we did not appear to be one point nearer the object for which it was undertaken. From certain words of the minister on a former occasion, Mr Grey inferred that this was a war of extermination, a mortal strife, to be carried on till one of the parties should be destroyed. He wished, by the motion, to put the question to issue whether this opinion was

1795.

George III. large, and even the enemy with whom we were contending, had a right to know the length to which the contest was to be carried, and the terms upon which peace was to be obtained. He endeavoured to show that there existed no prospect or chance of success in overturning by force of arms the republican government of France, and that a war persisted in with that view must necessarily be absurd; that the people of France were too firmly attached to their new arrangements to be likely to give them up, however they might change their leaders; that a dependence upon a decay of their finances was equally ill founded; and that, both in the American war and in this, the affairs of the British nation were unfortunately intrusted to persons unable to distinguish between the fallacy of imperfect calculations and the energy of a people struggling for independence. Our own resources were, he doubted not, equal to every thing to which they ought to be applied, but not equal to the conquest of France, or to a war of aggression. The exhausted state of the emperor's finances was evinced by a memorial he had recently addressed to the circles of the Upper Rhine. Was it then from him, from the Italian states, the kings of Sardinia, Naples, and Spain, or from our disgraceful alliance with the empress of Russia, that we expected assistance? Or was it from our good German ally, who had taken L.1,200,000 of our money, who had not brought into the field the sixty-two thousand men for which he stipulated, who had denied our right to command any of the Prussian troops, and contended that they ought not to march against the French, but to remain to defend Germany? The strongest reason which a great nation could have for war, was the defence of its honour; and this, he contended, we had so fully vindicated, as to secure us from future insult. The decree of the convention in November 1792 now formed no bar to a negociation, as that declaration had been repealed, and followed by a contrary declaration. As additional reasons, Mr Grey noticed the capture of Holland, and the debates in the diet at Ratisbon, in which all parties agreed for overtures to the enemy, except the elector of Hanover and the landgrave of Hesse. Mr Pitt, in reply, asserted that the motion was utterly inconsistent with the sentiments formerly expressed by his majesty and by parliament, and therefore proposed an amendment, importing that it was the determination of the house to prosecute the war, as the only means of procuring a permanent and secure peace. Mr Pitt contended that no nation at war with another ought to treat for peace with a government which could not give security; that this last was the great object by which alone the war could be terminated; that nothing but a series of revolutions had been generated under the system and principles now prevalent in France; that the agriculture and commerce of France were in the most disastrous situation, and justice almost unknown; that the house would never willingly consent to treat with a nation of atheists; that in April 1793, the French had enacted the penalty of death against any person who should propose peace with any country which did not acknowledge the French republic one and indivisible; that the admission of these principles amounted to a confession of the usurpation and injustice of every other government; and that treating with France would involve an acknowledgment of those principles which condemned the usurpation of all other governments, and and after some discussion in the House of Commons, his denied the very power which they were exercising. Fox accused the minister of tergiversation, and contended, that he had in fact found it necessary to alter his conduct; and that the impolitic speech which he had put into ing to L.13,000, were also set apart for the extinction of had made a serious impression upon the public. What, penses of the marriage, he asked, would have been the feelings of Englishmen, if tions of Carlton House.

Reign of countenancea by the House of Commons. The public at the convention had determined never to treat with them Reign of until there was a reform in the English government? He George IIL recalled to the recollection of Mr Pitt the declaration of his father, that they should die in the last breach before they granted the independence of America; yet the first act of the political life of the son had been to sign the very independence which his father had deprecated. Necessity had dictated that act; and he must now, on the same account, retract his declaration respecting France. The motion was opposed by Mr Dundas, on the ground that it would fetter the executive government in their negociations for peace; and ultimately the motion was

1795.

negatived, and the amendment adopted.

On the following day the Duke of Bedford brought forward, in the House of Lords, a motion similar to that which Mr Grey had introduced into the House of Commons; and Lord Grenville moved an amendment precisely similar to that which had been proposed by Mr Pitt and carried in the House of Commons. A great deal of discussion followed; but ultimately a large majority voted in favour of the amendment. The victories of the French during the last campaign, and the despair of ultimate success in the war, which now began to be entertained throughout the country, encouraged opposition to renew the subject under a variety of forms, and to urge ministers to enter into a negociation; but on every occasion the motions made by them were negatived by a similar superiority of numbers.

The number of seamen and marines voted during the present session amounted to a hundred thousand, whilst a. hundred and nineteen thousand three hundred and eighty men were voted to form the guards and garrisons. In order to procure the requisite number of seamen, the parliament required the merchants to give up a part of the crews of their shipping, in proportion to the tonnage, and ordered every parish to furnish one man for the service. A loan of L.18,000,000 was found necessary, together with a large issue of exchequer bills, as the supplies voted amounted to no less than L.29,307,000. The new taxes were made payable on wine, spirits, tea, coffee, stamps on deeds, insurance on ships and cargoes, timber, and on persons wear-

ing hair-powder.

During the present session the trial of Mr Hastings was at length brought to a conclusion. The subject was discussed in a committee of the House of Lords. The lord chancellor and the Earl of Carnarvon considered Mr Hastings as criminal; but he was ably defended by Lord Thurlow, who was supported by the Marquis of Lansdown, the Bishop of Rochester, and others. When every part of the accusation had been disallowed by the committee, the report was reviewed by the house; and after some debates on the mode of proceeding, it was resolved that the question should be put separately on sixteen points. greatest number of peers who voted the defendant guilty in any one respect did not exceed six, whilst the votes of not guilty on some of the charges were twenty-six, in others twenty-three, and in one nineteen. The lord chancellor then intimated the decision of the court to Mr Hastings, who received it in silence, and withdrew.

At this time the debts of the Prince of Wales amount ed to L.630,000; but it had been arranged at court that these debts should be paid, and that the prince should marry his cousin, the daughter of the Duke of Brunswick; establishment was fixed at L.125,000, out of which he was required to pay L.65,000 a year until his debts were liquidated. The rents of the duchy of Cornwall, amountthe mouth of his majesty, at the opening of the session, the dehts; and further sums were voted to defray the expenses of the marriage, as well as the repairs and decora-

Reign of 1795.

Parliament was prorogued on the 27th of June by a milder course of conduct, the military operations languish- Reign of

The incidents of the war during the year 1795 were less memorable than those of the preceding years. Lord Bridport, with an inferior force, attacked a French fleet near Port l'Orient, and took three of their ships. Viceadmiral Hotham pursued to the Genoese coast a fleet which had sailed from Toulon to attempt the recovery of Corsica, and had captured one of his detached ships; and having brought the enemy to a partial engagement, he took two sail of the line; but he afterwards lost one of his own ships in consequence of damage sustained in the conflict. On the western coast of France, the enemy, with thirteen sail of the line and fourteen frigates, avoided coming to an engagement with Vice-admiral Cornwallis, who had only eight ships including frigates. These events occurred early in summer. But notwithstanding the vigilance of the British navy, the French captured, in the month of July, thirty sail of a valuable convoy returning from the Mediterranean, and also made prize of part of a Jamaica fleet; but, on the other hand, their own commerce had sunk so low as to present few objects of attack to our cruizers and privateers.

As the Dutch, though nominally the allies of the French, had, in fact, become subject to them, letters of marque were issued against them by Great Britain, and directions given to seize their colonial territories, under the professed intention, however, of restoring them when the stadtholder's government should be re-established. The Cape of Good Hope was taken, together with Trincomalee and the other Asiatic settlements of the Dutch, excepting only Batavia. Their territories in the West Indies were not attacked during the present year, on account of the difficulties which the British experienced in that quarter in keeping in subjection the islands captured from the French, where various insurrections were incited by their ancient masters. Jamaica was also kept in a state of great alarm by a small tribe of independent negroes, called Maroons, who had long existed in the mountainous parts of the island. These people, having quarrelled with the white inhabitants, committed many cruel ravages, and were not subdued till Spanish hunters and blood-hounds were procured from the island of Cuba, and employed against them, which induced them at last to submit to deportation from the island.

The British ministry resolved, when it was too late, to give assistance to the royalists in the western parts of France; and an expedition, planned by Mr Windham, and guided by French emigrant officers, with troops, many of whom consisted of prisoners of war, relieved from confinement on condition of bearing arms against their native country, set sail for the French coast, and landed upon the extremity of the narrow peninsula of Quiberon. Here they fortified themselves; but many of the troops proving unfaithful, and the expedition being otherwise ill conducted, they were speedily overpowered by the republicans, who put to death such of their countrymen as they found in arms fighting against them. By this feeble and ill-timed invasion of the French territory, nearly ten thousand men were killed or taken prisoners.

The continental campaign on the side of Germany was of little importance during this year, but upon the whole it proved unfavourable to the French. The convention had shaken off the yoke of that sanguinary faction which, under Robespierre and his frantic associates, had deluged the interior of France with blood, but had nevertheless the merit of calling forth with astonishing energy the powers present leaders possessing less activity, and affecting a the evils they had suffered from the continuance of war;

George III. speech from the throne, in which ministers thought it pru- ed; and the French army remained inactive till autumn, George III. dent to hold out to the public some prospect of negocia- when it crossed the Rhine near Mentz under General Pichegru, but was speedily repulsed, and an armistice concluded for the winter. The convention, however, established a new form of government, consisting of an executive directory of five persons, elected by two representative bodies, to which the powers of legislation were intrusted, and it was expected, that if the war continued, the new executive power would endeavour to distinguish itself by some important operations.

> The British parliament was again assembled at an early period, namely, on the 29th of October. The state of public affairs wore at this period an unfavourable aspect. The French armies had been inactive during the summer, but they had lost nothing; for the new republic retained possession of the territory extending from the Pyrenees to North Holland, and consequently of an immense length of coast opposite to Great Britain. Meanwhile, a dearth of provisions began to prevail at home. The winter, which had set in with extreme severity at the close of the year 1794, and had enabled the French to conquer Holland with little difficulty, was followed by an ungenial summer, during which the crop failed in consequence of almost incessant rains. This state of things was productive of discontent among the lower orders, and the war was blamed as tending to aggravate the distress which they thus suffered. Previous to the assembling of parliament some meetings were held by the London Corresponding Society, for the purpose of petitioning the king and parliament in favour of peace and of parliamentary reform; and as the meetings were held in the open fields, they were very numerously attended, but the persons composing them dispersed without disturbance. At the opening of parliament, however, some riots took place.

His majesty proceeded from the palace to open the session of parliament at the usual hour; and the crowd in St James's Park, which is always considerable on these occasions, was certainly much greater than usual. A fine day, and a rumour which had been circulated that a riot was likely to take place, contributed greatly to increase the multitude of the spectators. As the royal carriage passed along the park, the predominant exclamations uttered were "Peace, peace! Give us bread: No Pitt; no famine; no war !" and a few voices were heard to exclaim, " Down with George," or words to that effect. In the park and the streets adjacent to Westminster, stones and other missiles were thrown, some of which struck the state coach, and one of them, supposed to have been thrown from a house in Margaret Street, perforated a window of the carriage by a small circular aperture. From this circumstance it was alleged to have been a bullet discharged by an air-gun, or by some similar engine; but no bullet was found; and happily it neither touched the king nor the noblemen who attended him. As his majesty returned from the house through the park, the gates of the horseguards were shut to exclude the mob; yet even this precaution was not sufficient to prevent a renewal of the outrages, and another stone was thrown at the carriage as it passed opposite to Spring Garden Terrace. After the king had alighted at St James's, the populace attacked the state-carriage, and, in its way through Pall-mall to the Mews, it was almost entirely demolished. The speech from the throne stated that the general situation of affairs, notwithstanding many events unfavourable to the common cause, was materially improved; that the French had been driven back in Italy, and checked on the side of Germany; that their successes, and the treaties of peace of the country for the support of its independence. The which they had entered into, were far from compensating

Reign of that the unparalleled embarrassment and distress of their George III. internal situation had produced an impression that their only relief must result from peace and a settled government; that the crisis in which they now were must probably produce consequences important to the interests of Europe; and that if this crisis terminated in any thing affording a reasonable expectation of security in any treaty, the appearance of a disposition to treat for peace on just and suitable terms would be met, on the part of the British government, with an earnest desire to give it the speediest effect. In the speeches for and against the usual addresses little novelty occurred, the expediency of continuing the war having been so often discussed before.

Meanwhile administration took advantage of the attack upon his majesty's person to issue a proclamation, connecting the meetings of the Corresponding Society with the insults offered to his majesty, and also to bring forward two new penal statutes. The first was introduced into the House of Lords by Lord Grenville, and entitled an act for the preservation of his majesty's person and government against treasonable and seditious practices. One clause enacted capital punishment against every one who should express, utter, or declare, by the publication of writings, or by any overt act, such imaginations, devices, or intentions, as were calculated to injure the king, impair his authority or that of the parliament, or promote an invasion of his dominions; another provided, that all declarations tending to excite hatred or contempt of the king should be considered as high misdemeanours; and a third, that a second offence might be punished, either in the ordinary mode, or by banishment from the realm for a term not exceeding seven years. The other bill, introduced by Mr Pitt into the House of Commons, provided, that no meeting of any description of persons, exceeding the number of fifty, except such as might be called by sheriffs or other officers or magistrates, should be holden for political purposes, unless public notice had been previously given by seven housekeepers; that if such a body should assemble without notice, and twelve or more individuals should continue together, even quietly, for one hour after a legal order for their departure, they should be punished as felons, without benefit of clergy; and that the same rigour might be exercised, if any person, after due notice of the meeting, should use seditious language, or propose the irregular alteration of any thing by law established. With regard to the delivery of lectures or discourses, or the exercise of debate on topics connected with the laws and government of the country, a license was declared to be necessary. Very animated discussions took place upon these bills in both houses of parliament, and many petitions were presented against them; whilst, on the other hand, various corporations and public bodies petitioned for their enactment. But the result nevertheless was, that the bills were passed by great majorities.

Still, however, administration were sensible that it would become necessary, for the sake of preserving their popularity, to assume an appearance of willingness to put an end to the war; and accordingly, whilst the bills were under discussion, each house received a message from the king, in which, alluding to the new constitution, and the directorial government of France, he stated that such an order of things had arisen as would induce him to meet any desire of negociation on the part of the enemy with a full readiness to give it the speediest effect. An address of thanks having been moved, Mr Sheridan suggested an amendment, tending to promote immediate negociation, and Mr Fox also wished that the first advances should pro-

tion to negociate. Similar observations were made in the Reign of House of Peers. A species of advance towards negocia-George III. tion was nevertheless made soon afterwards on the part of Britain, though in a very oblique and indirect mode. Mr Wickham, his majesty's minister to the Swiss cantons, transmitted, on the 8th of March 1796, a note to M. Barthélemi, the French ambassador at Berne, stating that he himself was not authorized to enter into any negociation, but requesting information in writing on the part of the French court about three points; first, whether France was disposed to send ministers to a congress to negociate a general peace with his Britannic majesty and his allies; secondly, whether the French government were willing to state the general grounds upon which they would consent to conclude a treaty; and, thirdly, whether the French government would think fit to propose any other mode of arriving at a general pacification. M. Barthélemi returned an answer on the 26th of the same month, stating that the executive directory doubted the sincerity of these overtures of peace, from the proposal of a general congress, which would lead to endless negociations, and from Mr Wickham not having received powers to negociate; asserting the willingness of France to make peace; but declaring that the executive directory had no power to relinquish any of the territories which the constitutional act had declared to form an integral part of the French republic. With regard to the other territories occupied by the French armies, these might become objects of negociation. But as the Netherlands and the island of St Domingo had been declared by the new French constitution to form part of the territory of the republic, the British government immediately published a note intimating that these pretensions on the part of France were totally inadmissible; and that while they were persisted in, nothing was left but to prosecute a war equally just and necessary. This first attempt towards negociation for peace gave rise to various debates in the British parliament, in all of which administration were supported by their usual majorities.

Supplies were voted during this session to the amount of L.37,588,000, and upwards of twenty-five millions and a half were borrowed. As no prospect existed that British armies could be employed on the Continent, the guards and garrisons were reduced to forty-nine thousand men; the forces in the colonies were increased to seventy-seven thousand; and the sailors and marines amounted to a hundred and ten thousand. Taxes were imposed on legacies to collateral relations, and on horses, and dogs, and hats; the assessed taxes were increased, and also the duties on wine, tobacco, salt, and sugar. Parliament was dissolved on the 20th of May, and new elections immediately took

An extremely active campaign was now opened by the French upon the Continent. Their generals, Moreau and Jourdan, penetrated into Germany; but they were ultimately repulsed by the Archduke Charles, though not till they had reached the vicinity of Ratisbon. The retreat of Moreau, amidst hostile armies, and through the difficulties and entanglements of the Black Forest, formed one of the principal events of the war, and has been much lauded by some military writers, though severely criticised by Napoleon. On the side of Italy the French obtained. greater success. Their new general in that quarter, Bonaparte, turned the Alps by the Col di Tende, and gaining in rapid succession the victories at Montenotte, Millesimo, and Dego, compelled the king of Sardinia to desert. the allies, and to purchase peace at the expense of a conand to remove all obstacles to the attainment of peace; siderable portion of his territory. He next descended into the Milanese; obliged the Italian states to surrender their ceed from our court; but Mr Pitt and Mr Dundas thought finest paintings, statues, and other curiosities, together with it advisable to wait until the enemy manifested a disposi- large sums of money, as the price of peace; and after a

Reign of multitude of sanguinary conflicts at Lodi, Arcole, Lonato, But although these were reported as prosperous, yet each Reign of out to attempt the re-capture of the Cape of Good Hope, but which was itself made prize of by the British admiral Sir George Elphinstone, afterwards Lord Keith. On the other hand, the British were under the necessity of abandoning Corsica, in consequence of the conquests of Bonaparte in Italy, and the mutinous spirit of his countrymen the Corsicans. The result of the campaign was, that the necessary to send Lord Malmesbury to Paris on the pretence of attempting to negociate a peace; but it was afterwards admitted by Mr Pitt that they had no wish to conclude a treaty, and that the measure was adopted merely in compliance with the wishes of the public. Accordingly, as the French still refused to relinquish their hold of the Netherlands, this was accounted a sufficient reason for persevering in the war.

In the early part of the session of parliament, which met on the 6th of October, there occurred few debates, on account of the intention to attempt an immediate negociation, which had been announced in the king's speech, and afterwards from expectation of its issue. But at the close of the year the French directory, in consequence of an invitation from a disaffected party in Ireland, sent an expedition of seventeen ships of the line and many smaller vessels, having on board an army of eighteen thousand men under General Hoche, to invade that country. The violence of the weather prevented this armament from assembling at the rendezvous in Bantry Bay, and no landing was in consequence attempted; so that the fleet returned home with the loss of two ships of the line and two frigates, which perished in a tempest, and of one frigate taken by the English. Shortly afterwards the French disembarked on the coast of Pembrokeshire twelve hundred and fifty criminals, whom they had sent as soldiers upon the Irish expedition, and knew not how to dispose of after the failure of that attempt.

At this period the first instance of serious difficulty occurred in the management of the British funding system. The large sums of money sent abroad as subsidies to foreign princes by government had diminished the quantity of gold and silver in Great Britain, whilst administration, through the medium of the Bank of England's paper, had issued immense sums for the public expenses, and in payment of the additional interest of the national debt. The alarm occasioned by the Irish invasion coming in addition to these circumstances, produced a run upon the bank to exchange its paper for specie; and as their coffers were soon drained, they found themselves under the necessity of giving a premium for bullion, which they paid with their paper. This made matters worse, as certain persons secretly melted down the guineas which the bank had caused to be coined and issued, and sold the gold to the bank as bullion for the sake of the premium. A ruinous traffic was thus carried on by the bank, which purchased bullion at a high rate, while they gave out their guineas at par. The directors, therefore, were under the necessity of laying their case before the privy council, which, after considering the circumstances of the case, issued an order authorizing the bank to discontinue the payment of their notes in cash. Considerable alarm was occasioned by this step; and committees of both houses of parliament were appointed to inquire into the state of the bank's affairs.

George III. Castiglione, Rivoli, and other places, he succeeded in sub- committee recommended a continuance of the restric- George IIL duing, by famine, Mantua, the only fortress that remain- tion; and an act was therefore passed for confirming it, ed to the Austrians in Italy. Few maritime events of much while, to render it less inconvenient, bank notes for one importance occurred. The Dutch were deprived of their and two pounds were put into circulation. As the bank whole intertropical possessions, with the exception of the of England is the medium through which the British gounhealthy but rich settlement of Batavia, in the island of vernment issues all payments, and as these payments were Java; and they also lost a squadron which they had sent made in the bank's paper, which administration might induce the directors to augment indefinitely, many persons feared and predicted that this paper would speedily sink in value when compared with gold and silver, as the French assignats and the American paper currency had done when rendered inconvertible at pleasure into specie. The stability of the British funding system, however, speedily displayed itself. The credit of the bank's paper British ministry, in order to appease the nation, found it remained unshaken, because government received it in payment of all taxes; and although depreciation soon followed, and prices necessarily rose, yet, from confidence in our resources, and a conviction of the immutability of the national faith, this depreciation was confined within narrower limits than it would have reached in other countries not so favourably circumstanced, and the credit of the paper continued unaffected by an operation which would have utterly ruined it anywhere else.

During the preceding year the emperor had received a subsidy, under the name of a loan, from the British government, and a new subsidy was now given him under a similar denomination. To supply this and the rest of the national expenses, L.27,647,000 were voted early in the session, and afterwards above fifteen millions additional were thought necessary, and voted. Two loans were negociated by government; one of sixteen millions and a half, in the usual way, from money-brokers; and another of eighteen millions, called the Loyalty Loan, from the nobility and gentry being requested to fill it up, which they did with great eagerness. The troops voted consisted of a hundred and twenty thousand seamen; sixty thousand seven hundred and sixty-five soldiers for European service, and above sixty-four thousand for the dependencies of Great Britain. As the threat of invasion was now revived, a large supplementary body of militia was levied, together with a considerable force consisting of cavalry. The interest of the two loans was provided for by taxes upon houses, stage-coaches, horses, auctions, stamps on agreements and newspapers, ornamental plate, spirits, tea, coffee, and other articles. Towards the close of the session the opposition brought forward motions to address the king to dismiss his ministers, resume the negociation with France, and repeal the two acts introduced in the preceding session, by Lord Grenville and Mr Pitt, for extending the treason laws, and imposing restrictions upon popular meetings for political purposes. They were encouraged by a variety of addresses which were presented to his majesty at this time from different parts of the country, advising him to dismiss the present ministry; but, as usual, their efforts proved unavailing.

The French had now acquired such an ascendency over the Spanish monarchy, as to induce the government of that country to declare war against Britain; and soon afterwards the Spanish fleet, amounting to twenty-seven sail of the line, attempted to join a French armament; but they were attacked by Sir John Jervis on the 14th of February, near Cape St Vincent, with only fifteen sail of the line; and four of their ships, of from seventy-four to a hundred and twelve guns, were made prizes by the British fleet. This victory may be regarded as the first of that mighty series of naval triumphs with which the name of Nelson is indissolubly associated. The British force consisted of two ships of a hundred guns, two of ninetyeight, two of ninety, eight of seventy-four, and one of

1797.

George III. Spaniards had one four-decker of a hundred and thirtysix guns, six three-deckers of a hundred and twelve, frigates and a brig. The disparity of force was therefore prodigious. The British were formed in two lines in the most compact order of sailing; and, by carrying a press of canvass, Sir John Jervis came up with the enemy's fleet at half-past eleven on the 14th, before it had time to collect and form a regular order of battle. Not a moment was to be lost; so, departing from the regular system, the British passed through their fleet, in a line formed with the utmost celerity, tacked, and thereby cut off nine ships, or one third, from the main body. The vessels thus separated attempted to form on the larboard tack; but only one of them succeeded, under cover of the smoke, which prevented her intention being discovered till she had reached the rear; whilst the others were so warmly received that they put about, and did not again appear in the action till towards its close. The admiral now made a signal to tack in succession; but Nelson, whose station was in the rear of the British line, perceiving that the Spaniards were bearing up before the wind with an intention of forming their line, going large, and joining their separated ships, or avoiding a close engagement, disobeyed the signal, without a moment's hesitation, and ordered his ship to be wore. This at once brought him in contact with the Santissima Trinidad of a hundred and thirty-six guns, the San Josef of a hundred and twelve, the Salvador del Mundo of a hundred and twelve, the San Nicolas of eighty, the San Isidro of seventy-four, another seventy-four, and another first-rate; but Trowbridge, in the Culloden, immediately joined, and nobly supported him; and for nearly an hour did the Culloden and the Captain, Nelson's ship, maintain the most terribly unequal contest recorded in the annals of naval warfare. At length the Blenheim, passing between them and the enemy, gave them a respite, while she poured in her fire upon the Spaniards. The Salvador del Mundo and San Isidro now dropped astern, and were fired into in a masterly style by the Excellent, Captain Collingwood. San Isidro struck, and the Salvador also hauled down her colours; but Collingwood, disdaining the parade of taking possession of beaten enemies, pushed on, with every sail set, to save his old friend and messmate, Nelson, in the Captain, which was at this time fired upon by three first rates, by the San Nicolas, and by a seventy-four; whilst the Blenheim was ahead, and the Culloden, crippled, astern. Ranging up in the noblest style, and hauling up his mainsail just astern, Collingwood passed within ten feet of the San Nicolas, and giving her a tremendous fire, passed on to the Santissima Trinidad. The San Nicolas then luffed up, when the San Josef fell on board her, and Nelson resumed his station abreast of them, and close alongside. But the Captain being now incapable of further service, either in the line or in chase, Nelson directed the helm to be put to starboard, and the boarders to be called up. His orders were instantly obeyed; the San Nicolas was boarded, and, after a short but sharp contest hand to hand, carried in the most brilliant manner. But a fire of pistols and musketry having been opened on the victors from the stern gallery of the San Josef, Nelson, directing his captain to send more men into the prize, gave orders for boarding that ship from the San Nicolas; and, leading the way himself, exclaiming "Victory or Westminster Abbey!" the thing was executed in an instant, with an energy and enthusiasm which rendered all resistance hopeless. But the Spaniards had still eighteen or nineteen ships which had suffered little or no injury; and as the part of the leet which had been separated from the main body in the

Reign of sixty-four, with four frigates, a sloop, and a cutter. The morning was now coming up, Sir John Jervis made signal Reign of to bring to. If the enemy had chosen at this moment to George III avail themselves of their great superiority of force, the two eighty-fours, and eighteen seventy-fours; with ten situation of the British admiral would have been most critical. His ships could not have formed without abandoning those which they had captured, and running to leeward; the Captain was lying a perfect wreck on board her two prizes, with her fore-topmast shot away, and not a sail, shroud, or rope left, while her wheel was smashed; and many of the other ships were so shattered in their masts and rigging as to be wholly unmanageable. But the Spanish admiral, Don Josef de Cordova, having inquired of his captains whether they judged it proper to renew the action, and nine having answered in the negative, whilst others gave their opinion in favour of delay, abandoned all idea of recommencing the battle, and drew off, leaving the British in possession of the prizes which they had so gallantly won. For this victory the commander-in-chief was rewarded with the title of Earl St Vincent, and Rearadmiral Nelson had the order of the Bath given him. It was his skilful and daring disobedience of orders which rendered the battle decisive.

> At the commencement of the summer an event occurred which, had the French been prepared to attempt an invasion of this country, might have been productive of serious evils. This was a mutiny in the fleet. Gross impositions had for some time been practised upon the seamen, both as to the quantity and quality of the provisions allowed them; and they had made an anonymous application for redress to Earl Howe. But the application was disregarded, because the strictness of discipline prevented the open avowal or appearance of discontent, which his lordship inconsiderately supposed had no existence; and the seamen, disappointed of the expected relief, resolved to enforce the consideration of their claims. Accordingly, when orders were given to prepare for putting to sea, the crew of the Queen Charlotte, and other ships lying at Spithead, refused to act; and treating with contempt the remonstrances of the officers, they made choice of delegates, who after a formal consultation drew up petitions to the board of admiralty and the House of Commons. Earl Spencer, first lord of the admiralty, dreading a dangerous mutiny, and not thinking the demands of the seamen unreasonable, promised compliance; and the king readily offered full pardon to all who should immediately return to their duty. But the seamen would not be satisfied till the parliament had confirmed the promises of the admiralty; and as some delay thus ensued, the irritation of their minds led to a contest with Vice-admiral Colpoys, in which some lives were lost. An act, however, was passed for the gratification of the seamen in point both of pay and provisions; and subordination was restored at Spithead and Plymouth. The concession of these claims encouraged the seamen at the Nore to insist on a more punctual discharge of arrears, a more equal distribution of prize-money, and a general abatement of the severity of discipline. A council of delegates was elected, at the head of which was a seaman named Richard Parker, who took the command of the fleet, and prevailed upon the men to reject repeated offers of pardon. He robbed two merchant ships of provisions, obstructed trade by the detention of other vessels, and fired on some ships of war which refused to accede to the mutinous combination. An act of parliament was passed in the beginning of June, denouncing capital punishment against all who should hold intercourse with the rebellious ships, or voluntarily continue on board; and as the public strongly disapproved of this last mutiny, for which no excuse could be offered, the seamen gradually returned to their duty. Parker was apprehended, and, along with several other mutineers, punished with death; and a

George III. the greater part of them were pardoned.

During the summer the port of Cadiz was blockaded by the British fleet under Sir John Jervis, now Earl St an end to all dread of invasion. Vincent; and an attempt was made against the Spanish island of Teneriffe, but without success. Meanwhile another fleet under Admiral Duncan watched the Texel; but the blockading force having retired for a short time, the Dutch fleet, under Admiral De Winter, put to sea. Intelligence of this event having been brought to Admiral Duncan at Yarmouth, he instantly proceeded in quest preliminaries of peace at Leoben, on the 18th of April, of the enemy; and about eleven o'clock in the forenoon of the 11th October 1797 he got sight of the squadron which had been left to watch their motions, and which displayed signals of an enemy to leeward. Admiral Duncan immediately made signal for a general chase, and soon got sight of the Dutch, forming in a line on the starboard tack to receive him, the land between Camperdown and Egmont being then about nine miles to the leeward. On making this discovery, he shortened sail to connect the squadron; and finding there was no time to be lost in making the attack, he made signal to bear up, break the enemy's line, and engage each ship her opponent to leeward, without waiting to form the line of battle. The order was promptly and gallantly obeyed; Vice-admiral Onslow, in the Monarch, bore down on the enemy's rear, his division following his example; and about forty minutes past twelve o'clock the battle commenced. Admiral Duncan, in the Venerable, also passed through the enemy's line, at the head of his division, and began a close action with the enemy's van, which lasted two hours and a half, when all the masts of the Dutch admiral's ship were observed to go by the board, and she not long afterwards struck to her opponent. The Dutch vice-admiral's ship being also dismasted, surrendered to Vice-admiral Onslow, and nine others became the prizes of the conquerors. The battle was obstinate and sanguinary; but its decisive results may be ascribed to the bold manœuvre of instantly pushing between the enemy and the land, to which they were fast approaching. Had Admiral Duncan waited to form line of battle, in the ordinary way, there either would have been no action at all, or if the British had attacked, the Dutch admiral, by getting nearer to the shore, would probably have drawn both fleets on it, which would have been a victory to him. The force on both sides was nearly equal, each squadron consisting of sixteen ships of two decks; but of the British not more than ten ships were seriously engaged, and these captured eleven of the enemy. Had Admiral Duncan's fleet been composed of the same materials as Lord St Vincent's, every Dutch ship would have been taken; and the same result would have followed had all the ships followed the example set them by the Venerable. The fact is, however, that the British squadron was composed of very indifferent and inadequate vessels, many of them having been intended for Indiamen; and that it was otherwise in many respects ill conditioned and deficient; but there was no want of gallantry on the part of the crews, and

Reign of considerable number were also condemned after trial, but away, a seaman of the name of Crawford nailed the flag Reign of to the top-mast head. This victory excited the most George III lively joy in the British nation, from its tendency to put 1797.

While their allies, or rather subjects, were suffering these disasters by sea, the French armies triumphed on the Continent. Bonaparte advanced from Italy against the centre of the Austrian dominions, and, after several sanguinary conflicts, crossed the Alps where they approach the frontiers of Hungary, and forced the emperor to conclude which were followed by a definitive treaty, signed at Campo Formio, near Udine, on the 17th of October. The emperor acquired the city of Venice; but he relinquished the Milanese and the Netherlands, and, by secret articles, consented that the Rhine should form the boundary of France. Britain being now left alone in the contest into which she had originally entered as an auxiliary to Austria and Prussia, the government opened a negociation towards the close of the summer; and as both the French and British nations eagerly wished for a termination of this sanguinary contest, it is probable that administration seriously wished to conclude a treaty; but at this time a party, headed by the director Barras, had gained the ascendency in France, and resolved to continue the war. A demand was therefore made that Britain should renounce every conquest as a preliminary to negociation, whilst France reserved a right to make further demands; and on this being refused, the British ambassador, Lord Malmesbury, was dismissed from Lisle, where the negociations had been opened.

Parliament assembled on the 2d of November. In the speech from the throne his majesty stated his concern that his endeavours to restore peace had been rendered ineffectual, and expressed the fullest reliance on the magnanimity and courage of the people. During this session of parliament few or none of the members of opposition attended. At the close of the preceding session they had declared it to be their intention to retire from parliament; and they justified their conduct by alleging that, in times when every man who censured the measures of administration was regarded as in league with the enemy, it was equally painful and useless to incur such odium; that if they declared their sentiments, they were proclaimed as the enemies of the king, and if they tacitly acquiesced in the measures of the minister, they voluntarily took upon themselves a share of the responsibility; that they had done their utmost to prevent the war, and had urged repeatedly the necessity of bringing it to a speedy termination, without persuading their opponents; that events must now take their natural course; and that as they could not aid by their counsel, it should not be said that they embarrassed by their opposition. This retirement of opposition was much resented, and spoken of with great bitterness, by the friends of administration, as it suggested to the nation the idea that government was conducted by the power of the crown alone, unchecked by any discussion of its measures in the two legislative assemblies.

The inability of the bank of England to pay upon dewhen the main-top-gallant mast of the Venerable was shot mand its notes in specie, according to ancient custom and

¹ The following characteristic anecdote has been related of an officer who distinguished himself by his gallantry in this action. Captain Inglis of the Belliqueux of sixty-four guns, owing either to long absence from the service, or to an inaptitude not very uncommon among naval officers of the old school, had neglected to make himself master of the signal-book; and on the morning of uncommon among haval officers of the old school, had neglected to make himself master of the signal-book; and on the morning of the day of battle, when it became necessary to act with promptitude, in obedience to the signals, he found himself more puzzled than enlightened by it. After poring over it for some time, without being in any degree benefited by the perusal, he threw it with contempt upon the deck, exclaiming in broad Scotch, "Damn me, up wi't he hellem and gang into the middle o't." These words are instinct with the true spirit of battle, and show that Captain Inglis bravely anticipated the remedy in such cases provided by Nelson, who, in his celebrated memorandum on the eve of the mighty combat of Trafalgar, observes, that "if a captain should be at a loss, he cannot do very wrong if he lay his ship alongside of the enemy." In strict conformity with this doctrine, the Belliqueux lost no time in "ganging into the middle o't," by attacking the enemy's van, which she contributed to throw into confusion, although she got rather roughly treated by them before she could be supported.

Reign of the terms of the obligation contained in these notes, ap-George III. pears now to have created in Mr Pitt's mind some dread respecting the funding system, and an apprehension, that from the immense sums annually borrowed, and the corresponding quantity of paper-money necessarily issued to pay the interest of the loans, the system might be carried so far as to discredit the paper-money issued in the name of the bank of England. And this apprehension was strengthened by a fact, of which everybody was daily becoming more sensible, namely, that the money price of all kinds of property in Great Britain had rapidly risen during the war; and this rise of price was justly ascribed to a gradual sinking in the value of money, or of paper, the only money used in Britain, in consequence of its too great abundance. Mr Pitt therefore proposed, instead of borrowing the whole sum necessary to defray the expense of the war, and imposing no more taxes than were requisite to pay the interest of the loan, that heavier taxes should be imposed, in order to defray a portion of the extraordinary expenditure. Accordingly an act was passed for raising seven millions within the year; and this was to be effected by augmenting the assessed taxes, but so as not to compel any individual to pay more than one tenth of his income. The leading members of opposition attended to oppose this extraordinary measure, but without effect.

> As the French were now disencumbered of all other adversaries, it was naturally expected that they would turn their arms in a more direct manner than formerly against the British empire. The result of the combination of the states of Europe for the partition of France had been extremely disastrous, and had left the new republic in possession of an extent of territory which the ablest and most ambitious of the French monarchs had in vain aspired to possess. The command which they had now obtained of Holland rendered France more dangerous than formerly, by the superior means of invasion which an additional extent of coast and the possession of a large quantity of shipping might afford; and had the French navy been less weak, or the French rulers possessed of greater ability, a dangerous crisis in the history of Great Britain might at this period have occurred. It never was the interest of any British administration to conceal from the public at large the possibility of a foreign invasion; and as the French government at this time boasted of their intention to make such an attempt, and ordered a considerable army to advance to the sea coast, it became the duty of ministers in Great Britain to make preparations to resist any such effort. Accordingly they came forward in parliament to propose measures of defence; and the danger with which the nation considered itself as threatened obliged all men in some measure still to adhere to an administration which in other respects might have lost their popularity from the ill success of their late measures. On the 8th of February 1798 Mr Dundas introduced into the House of Commons a bill to enable the king to incorporate in the regular militia a portion of the supplementary militia. And this bill being passed with little debate, the same minister, on the 27th of March, moved for leave to bring in another, to enable his majesty to provide for the security and defence of these realms, and to indemnify persons who might suffer injury in their property by the operation of such measures. The object of this bill was to provide for every possible emergency, by giving a power to his majesty to discover what persons were prepared to appear in arms and to be embodied for the public defence; and also to ascertain what number of the inhabitants of certain districts would be able to act as pioneers, or in other laborious situations. The other provisions were, that in the event of its being necessary to employ persons as pioneers to remove stock, or assist in facilitating the carriage of

military stores, proper compensation would be made; and Reign of the bill was also intended to give a power of embodying a George III. portion of the regular militia, and employing them in the defence of the country. This bill was passed into a law after some unimportant debates, the principal members of opposition not usually attending.

1798.

As it was supposed that the war, on the part of Britain, would occasion greater expense than when all Europe had been engaged in it along with her, the supplies were augmented to L.35,000,000; and, with a view to draw resources from distant parts of the country, instead of raising large loans for the public service, which were negociated in London alone, Mr Pitt brought forward a scheme by which proprietors of land were enabled to redeem the land-tax; in other words, the owner of land, and, failing him, any other person, was to be permitted to purchase this tax, by a transfer of stock, which produced a dividend greater than the amount of the impost. The measure became law, but produced little immediate effect.

On the 25th of May Mr Pitt brought forward a bill in the House of Commons, with a view to increase the navy, and to resist with greater success the threatened invasion. On this occasion an event occurred, which indicated, that by the long possession of power, and the support he had received from the nation, Mr Pitt had suffered to grow upon him a certain haughtiness of manner and impatience of contradiction, which, in former times, would have proved extremely inconvenient to a British minister. On the subject of his proposed bill, he observed, that the object he had in view was to suspend, for a limited time, the protections which various descriptions of persons enjoyed, to prevent them from being impressed into the service of the navy; and he stated it as his wish that the bill should that day pass through its different stages, with a suitable pause at each if required, and that it should be sent to the Lords for their concurrence. Mr Tierney remarked on the very extraordinary manner in which Mr Pitt called upon the house to adopt this measure. He had imagined that the augmentation of the navy was to be provided for in the usual way; or, if any very uncommon mode was to be resorted to for the attainment of that object, that notice would have been given to the house. He had heard no arguments that proved its propriety; and even if he had, some time ought to have been allowed to weigh the force of such arguments, before proceeding to give three or four votes on a measure, of which no notice of any kind had been given. If the ministers persisted in hurrying the bill through the house in the manner proposed, he must give it a decided negative; and, indeed, from what he had already seen, he must view all their measures as hostile to the liberties of the subjects of this country. Mr Pitt replied, that if every measure adopted against the designs of France was to be considered as hostile to the liberty of this country, then indeed his idea of liberty differed widely from that of the honourable gentleman. He observed that he had given notice before of the present motion, and that if it were not passed in a day, those whom it concerned might elude its effects. But if the measure was necessary, and if a notice of it would enable its effects to be eluded, how could the honourable gentleman's opposition be accounted for, except from a desire to obstruct the defence of the country? Mr Tierney called Mr Pitt to order; and the Speaker observed, that whatever had a tendency to throw suspicion on the sentiments of a member, if conveyed in language that clearly marked that intention, was certainly irregular. Mr Pitt replied, that if the house waited for his explanation, he feared it must wait a long time. He knew very well that it was unparliamentary to state the motives that actuated the opinions of gentlemen; but it was impossible to go into arguments in favour of a

Reign of question, without sometimes hinting at the motives that gociation carried on at Rastadt, between the French di-Reign of George III. induced an opposition to it. He submitted to the judgment of the house the propriety of what he argued; and he would not depart from any thing he had advanced, by either retracting or explaining it. The result of this altercation was a duel on the following Sunday between Mr Pitt and Mr Tierney. They went to Putney Heath, attended by seconds, and, standing at the distance of twelve paces, fired two shots each; but Mr Pitt discharged his second pistol in the air, upon which the seconds in-

terfered, and thus the affair terminated.

During the summer of this year a rebellion broke out in Ireland, the particulars of which will be stated in their proper place. The enthusiasm which the French revolution had kindled in so many quarters of Europe extended itself to Ireland. There, some men of ardent imaginations, chiefly Protestant dissenters, persuaded themselves that they could regenerate their country, cast off the dominion of Great Britain, heal the unhappy divisions among the inhabitants of Ireland, and convert it into an independent republic. As early as the year 1793 these persons formed themselves into a society, under the name of the United Irishmen, and were gradually joined by a very large proportion of the population of the country. They applied for aid from France; and it was in consequence of their urgent invitation that the unsuccessful expedition under General Hoche was undertaken. From that period the country remained in a state of the greatest alarm. On the one side rigorous laws were enacted, and every effort was made, by severity of punishment, to repress all appearance of opposition to the existing government; whilst, on the other, the common people busied themselves in the fabrication and concealment of pikes, or broke into the houses of country gentlemen, to seize whatever fire-arms they could discover. The schemes of the disaffected party were greatly disconcerted by the discovery and apprehension of their principal leaders. A rebellion, however, actually broke out; but, though attended with considerable destruction of human lives and of property, it was of a partial nature, and speedily suppressed. During its existence some circumstances occurred which completely demonstrated of how visionary a nature had been the schemes of those persons who hoped to establish in Ireland an independent government upon any basis that could afford a tolerable hope of national prosperity. The disaffected party among the Protestants, too weak to be able of themselves either to shake off the dominion of Great Britain, or to assume the ascendency in Ireland, were under the necessity of calling in the aid of the Roman Catholics, who constitute the great mass of Irish population; and they were the more readily induced to do so, from a notion, which of late years had very generally gained ground in Europe, that religious sentiments form no proper ground of distinction in civil society, and from perceiving the facility with which the Catholics of France had set at defiance the religion of their fathers, when placed in competition with what they accounted the interests of freedom, or the means of aggrandisement to their country. But it speedily appeared that these new maxims of conduct could not be adopted by the superstitious and illiterate peasantry of Ireland. The Catholics were no sooner in arms than their chief animosity came to be directed, not against the dominion of Britain, nor against any form of civil government, but against their own countrymen of the Protestant faith, who must thus ultimately have fallen a sacrifice to the success of their own schemes. In short, it became evident that Ireland could not possibly exist in tranquillity, or with safety to the Protestant part of its inhabitants, independent of the supremacy of Great Britain.

Upon the Continent, the world was amused with a ne- ambition was already accounted dangerous, formed a de-

rectory and the German empire. It was conducted with George III. much slowness, and ultimately proved ineffectual. But whilst it was in progress, the French government, having contrived to quarrel with the Swiss cantons, invaded and seized their country, and converted it into a new republic, under their own influence. Austria, however, had been so much humbled by recent losses, that she did not venture, on this occasion, to assert the independence of Switzerland, although it must have been evident that her own independence was ultimately connected with that object. Switzerland consists of a vast assemblage of lofty and precipitous mountains, situated in such a manner as to divide the most important countries of Europe from each other. On one side these mountains look down upon the fertile territory of Italy; to the north they command the very centre of Germany; and to the west they are bounded by France. For ages they have been inhabited by a virtuous and fearless race of people, divided into petty communities, who contented themselves with maintaining their own independence; and though, as individuals, they entered into the military service of the neighbouring princes, yet, as a people, they had long ceased to take any part in the wars of Europe. For some centuries the independence of Switzerland proved the chief basis of the independence of the neighbouring nations. All parties respected and avoided any dispute with the Swiss, in a war against whom much might be lost, but nothing could be won. Accordingly, when the French attacked the Austrians, and when the Austrians attacked the French, the assailing party was under the necessity of sending its armies to a great distance from the centre of its own power. If defeated, the march homewards was long and difficult; whilst, even if tolerably successful, the attack never proved seriously dangerous, in consequence of its having been made in a remote quarter with limited means Hence, in 1796, when the French generals Moreau and Jourdan marched through Suabia and Franconia to invade Austria, the length of their march afforded many opportunities of attacking them with success; and the invaded country had full leisure to call forth its whole resources against them. The result was, that when Jourdan sustained a defeat, the retreat of the other army became almost impracticable; and hence arose the unbounded reputation acquired by Moreau for accomplishing it with success. Had the French at that period occupied Switzerland, the retreat of Moreau would have been attended with little or no difficulty; because, by retiring into that rugged country, he could easily have made a stand against a very superior force for a considerable time, till he had received reinforcements. For the future, therefore, by commencing a war of invasion against Austria, not upon the frontiers contiguous to France, but at the eastern extremity of the Swiss mountains, the French, if successful, might reach the gates of Vienna in a few weeks. The independence of Switzerland, by placing these nations at a distance from each other, had hitherto prevented such an enterprise from being carried into effect; and the present removal of that barrier by the French directory, during a period of peace with Austria, displayed, upon their part, a correct knowledge of the cause which had at all times set bounds to the ambition of France, and at the same time evinced a determined spirit of hostility against the independence of the surrounding states.

Meanwhile the weakness of the French navy rendered it impossible for them to engage in any serious attack against the European part of the British empire. The French government, however, with the double view of attacking the rich empire which Britain had acquired in Asia, and of removing a successful military chief, whose

1798.

George III. and colonize Egypt. To accomplish this scheme with the greater safety, the threats of invading England were loudly renewed; the troops stationed on the coast were denominated the Army of England; and Bonaparte being now appointed their commander, visited them in person. But suddenly departing, he embarked at Toulon with a powerful army, before his intentions were suspected in Great Britain; Malta was surrendered to him on his passage; and departing thence, he landed in safety in the vicinity of Alexandria, and soon made himself master of all Egypt. Here, however, his successes terminated. He was closely pursued by a British fleet under Admiral Nelson; and the French admiral, Brueys, having remained at anchor near the shore in the Bay of Aboukir, afforded an opportunity for the British navy to earn one of its proudest and most decisive triumphs.

Why Bonaparte, having effected a landing in Egypt, should not have suffered the fleet to return, has never been explained. He accused Admiral Brueys, after that officer's death, of having lingered on the coast, contrary to orders; and the same charge is repeated in the memoirs which he transmitted from the place of his exile. But it is scarcely credible that any officer, situated as Brueys was, would have incurred the heavy responsibility which such disobedience incurs; and the more probable supposition therefore seems to be, that the fleet was detained by Bonaparte's orders. It arrived at Alexandria on the first of July; and Brueys, not being able to enter the port which time had ruined, moored his ships in Aboukir Bay, in a strong and compact line of battle; the headmost vessel being close to the shoal on the north-west of the bay, and the rest of the fleet forming a curve along the line of deep water, so as not to be turned by any means in the south-west. He had in fact made the best of his situation, and chosen the strongest position which he could possibly take in an open roadstead; so much so, indeed, that the commissary of the fleet thought they were moored in such a manner as to bid defiance to a force double their own. Besides, the advantage of numbers, in ships, guns, and men, was in favour of the French. They had thirteen ships of the line and four frigates, carrying eleven hundred and ninety-six guns, and eleven thousand two hundred and thirty men. The English had the same number of ships of the line, and one fifty-gun ship, the Leander, carrying only a thousand and twelve guns, and eight thousand and eighty-six men. The French had one threedecker of a hundred and twenty guns, and three eightygun ships; whilst the English ships were all seventy-fours. The moment Nelson perceived the position of the enemy, his intuitive genius suggested to him the decisive conception, that where there was room for a French ship to swing, there was room for an English ship to anchor; and the plan he accordingly adopted was to keep entirely on the exterior side of the French, and station his ships, as far as he was able, one on the outer bow, and another on the outer quarter of each of the enemy's, thus doubling on them in the way which had been projected by Lord Howe when he intended to attack the French fleet at their anchorage in Gourjean road.

As the British squadron advanced the enemy opened a fire from the starboard side of their whole line into the bows of the leading ships. It was received in silence and with stern composure; whilst the men on board of every ship were employed aloft in furling the sails, and below in tending the braces, and making ready for anchoring. Captain Foley led the way in the Goliath, outsailing the Zealous, which for some minutes disputed the post of honour with him; and intending to fix himself on the inner bow of the Guerrier, kept as near the edge of the

Reign of sign of sending Bonaparte, with an army, to seize upon shoal as the depth of water would admit; but his anchor Reign of hung, and having opened his fire, he drifted to the second George III, ship, the Conquérant, before it was clear, then anchored by the stern inside of her, and in ten minutes shot away her masts. Captain Hood in the Zealous took the station which the Goliath intended to have occupied, and in twelve minutes totally disabled the Guerrier. The Orion, Sir James Saumarez, next passed to windward of the Zealous, discharging her larboard guns as long as they bore on the Guerrier; and running inside the Goliath, sunk a frigate which annoyed her, hauled round towards the French line, and anchoring inside between the fifth and sixth ships from the Guerrier, took her station on the larboard bow of the Franklin and the larboard quarter of the Peuple Souverain, receiving and returning the fire of both. The Audacious, Captain Gould, pouring in a heavy fire into the Guerrier and the Conquérant, fixed herself on the larboard bow of the latter, and, when that ship struck, passed on to the Peuple Souverain. The Theseus, Captain Millar, followed, and having brought down the Guerrier's main and mizzen masts, anchored inside the Spartiate, the third ship of the enemy's line. The sun was now nearly down; but Nelson's decisive manœuvre had already been completely executed in its most critical parts.

1798.

The Vanguard, bearing the admiral's flag, and leading his division, now anchored on the outside of the enemy's line, within half-pistol-shot of the Spartiate, and veering half a cable, instantly opened a tremendous fire, under cover of which the Minotaur, Bellerophon, Defence, and Majestic, passed ahead to occupy their several stations. On this side the French were completely prepared; and in a few minutes every man stationed at the first six guns in the fore part of the Vanguard's deck was either killed or wounded. The Minotaur anchored next ahead of the Vanguard, and took off the fire of the Aquilon, the fourth in the enemy's line. The Bellerophon passed ahead and anchored by the stern on the starboard bow of the Orient of a hundred and twenty guns, Brueys' own ship, and the seventh in the line, "whose difference of force was in proportion of more than seven to three, and whose weight of ball from the lower deck alone exceeded that from the whole broadside of the Bellerophon." The Defence took her station ahead of the Minotaur, and engaged the enemy's sixth ship, the Franklin, by which judicious proceeding the British line remained unbroken. The Majestic having got entangled with the main rigging of one of the French ships astern of the Orient, suffered severely from the heavy fire of that three-decker; but she at length swung clear, and engaging the Heureux, or ninth ship, on the starboard bow, received also the fire of the Tonnant, which was the eighth in their line. The remaining four ships of the British squadron, having been detached previous to the discovery of the French, were at a considerable distance when the action commenced, which was at half past six; and as night closed about seven, they had no other light to guide them in going into action than the fire of the contending fleets.

Trowbridge in the Culloden, the foremost of the remaining ships, being two leagues astern, came on sounding as the others had done; but as he advanced the darkness increased the difficulty of the navigation; and suddenly, after having found eleven fathoms water, and before the lead could be hove again, he was fast aground; nor could all exertions get off the ship in time to bear a part in the action. This accident, however, proved in some degree fortunate, since the Culloden served as a beacon to the Alexander and Swiftsure, which would otherwise have gone upon the reef, and thus enabled them to enter the bay and take their stations in the darkness. As the Swiftsure was bearing down she fell in with what at first

Reign of seemed to be a strange sail, but proved to be the Belle- vereignty of the Roman empire was decided, no naval vic- Reign of George III. rophon, which, overpowered by the Orient, was now drifting out of the line towards the lee side of the bay, with her sails hanging loose, her lights knocked overboard, nearly two hundred of her crew killed or wounded, and all her masts and cables shot away. Suspecting how it was, Captain Hallowell, with great judgment, abstained from firing; and occupying with the Swiftsure the station of the disabled ship, he opened a heavy fire on the quarter of the Franklin and the bows of the French admiral; whilst Captain Ball, in the Alexander, passed under the stern of the Orient, and anchoring within side on her larboard quarter, raked her, at the same time keeping up a severe fire of musketry on her decks. Lastly, the Leander, finding nothing could be done to get off the Culloden, advanced with the intention of anchoring athwart hawse of the Orient; but the Franklin being so near ahead that there was not room for him to pass clear of the two, he took his station athwart hawse of the latter.

This description will serve to convey an accurate idea both of the plan of attack and of the mode in which it was carried into execution. Though fiercely contested and sanguinary, the issue of the battle was never for an instant doubtful. The first two ships of the French line had been dismasted within a quarter of an hour after the commencement of the action, and the others had suffered so severely that victory was already certain. At half past eight o'clock the third, fourth, and fifth, were taken possession of; and about nine a fire broke out in the Orient, which soon mastered the ship, illuminating the contending fleets with the light of the conflagration. About ten o'clock the ship blew up with an explosion so tremendous that the firing immediately ceased on both sides, and for a time no sound was heard to break this awful pause, except the dash of her shattered yards, masts, and timbers falling into the water from the great height to which they had been projected. The firing recommenced with the ships to the leeward of the centre; and at daybreak the Guillaume Tell and the Généreux, the two rear ships of the enemy, formed the only portion of their line which had colours flying. Not having been engaged, these ships cut their cables in the forenoon and stood out to sea, accompanied by two frigates, being the only portion of the enemy's fleet which escaped. It is needless to add that the victory was complete. Of thirteen sail of the line, nine were taken and two burnt; and of four frigates one was burnt and another sunk. The British loss in killed and wounded amounted to eight hundred and ninety-five; while of the French three thousand one hundred and five, including the wounded, were sent on shore by cartel, and five thousand two hundred and twenty-five perished. About two hours after the commencement of the action, Nelson received a severe wound on the head from a piece of langridge shot; and Captain Westcott of the Majestic fell. Brueys was killed before the fire broke out which destroyed his noble vessel. He had received three wounds, yet would not leave his post; but a fourth cut him almost in twain, and he died like a hero on the deck. From the description of this battle, or rather naval conquest, it must be obvious that its triumphant success was owing to a skilful repetition, with necessary variations, of the manœuvre which had decided the victory at Camperdown; and in fact Nelson, although not acquainted with Lord Duncan, wrote to him, soon after the battle, to tell his lordship how "he had profited by his example."1

From the time of the battle of Actium, by which the so-

tory was ever attended with consequences so immediately George III and obviously important as this. The French directory had concealed their intended enterprise from the Ottoman Porte, which lays claim to the sovereignty of Egypt, but has never been able to make its claim fully effectual. The grand signior, however, considered the present attempt as an act of hostility against himself; and the maritime victory above mentioned encouraged him to declare war, in the name of all true Mahommedan believers, against that host of infidels which had invaded the land from which the sacred territory of Mecca is supplied with bread. In Europe similar consequences took place. The irresistible career of Bonaparte had compelled Austria to submit to peace, upon terms which left France in a state of most dangerous aggrandizement. But as this victorious chief, with the best part of his veteran army, was now held under blockade by the British fleet in a distant country, the hopes of Austria began to revive, and there seemed reason to expect, that by renewing the contest, her ancient rank in Europe might be recovered. The king of Naples entered into these views with great eagerness, and rashly declared war against France, without waiting for, and following, as he ought, the movements of the greater powers. The empress of Russia was now dead, and her son Paul had succeeded to the throne of the Czars. The empress had never contributed more than her good wishes towards the war which the other powers of Europe had waged against France; but her son, a man of a furious and passionate character, had not the sense to follow the same cautious policy, or to remain a quiet

spectator of the issue of a contest against the French

republic; and, encouraged by the naval victory of the Nile,

which seemed to insure the absence of Bonaparte and his

army, he declared his willingness, as far as his finances

would permit, to join in a new combination against France. Thus, by the victory of the Nile, Great Britain was enabled to procure allies, willing to send abundance of troops against her enemy, provided she consented to defray the necessary expense. In the mean time, the acquisitions and losses of Britain were nearly equally balanced in other quarters. An armament sailed towards the island of Minorca, and a descent was effected near the creek of Addaya. Here a body of Spaniards threatened to surround the first division of the invading army; but they were soon repulsed, and our troops gained a position from which they might have attacked the enemy with advantage, if the latter had not retired in the evening. The army seized the post of Mescadal, and a detachment took the town of Mahon and Fort Charles. It was expected that the principal stand would have been made at Civadella, where new works had been added to the old fortifications; but the approach of the English drove the Spaniards within the walls of the town, and General Stewart summoned the governor to surrender it without delay. Intimidated by the movements of the troops and the appearance of the squadron, the garrison capitulated, and thus the whole island was reduced without the loss of a single man. But towards the end of the same year, the British troops, which during a considerable length of time had occupied a great number of positions upon the coast of the island of St Domingo, found it necessary to abandon the whole. The power of the French government there had nearly been annihilated by a negro commander, Toussaint-Louverture, to whom the British surrendered Port-au-Prince and St Marc. The losses incurred in consequence of the un-

1798.

Parliament assembled on the 20th of November; and in the speech from the throne it was observed, that the success which had attended our arms during the course of the present year had been productive of the happiest consequences, and promoted the prosperity of the country; that our naval triumphs had received fresh splendour from the memorable action in which Lord Nelson had attacked a superior enemy, and turned an extravagant enterprise to the confusion of its authors; that the magnanimity of the emperor of Russia and the vigour of the Ottoman Porte had shown that these powers were impressed with a just sense of the present crisis; that their example would be an encouragement to other states to adopt that line of conduct which was alone consistent with security and honour; that our preparatious at home had deterred the enemy from attempting to invade our coasts; that in Ireland the rebellion had been suppressed; that under the pressure of protracted war, the produce of the public revenue had been fully adequate to the increase of our permanent expenditure; that the national credit had been improved, and commerce flourished in a degree formerly unknown. The debates which occurred in the House of Commons upon this occasion were not remarkably interesting, as the leading members of the old opposition by Mr Tierney, Sir Francis Burdett, Sir John Sinclair, and ley moved the usual address to the throne, which was seconded by Lord Craven.

As a prospect had now opened of reviving, upon a most extensive scale, the continental war against France, it became necessary to provide great pecuniary resources to subsidize the armies which were to be brought forward, especially by the Russians, the poverty of whose country could ill afford to sustain the expense of supporting armies in Italy or on the banks of the Rhine. The same difficulties, upon this subject, nobody regarded his neighbour as unor rather doubts, however, concerning the prudence of carrying to its utmost length the British practice of borrowing money to defray the extraordinary expense incurred during each year of the war, which had led to an augmentation of what are called the assessed taxes, still induced the minister to attempt to raise a proportion of the extraordinary or war expenditure within the year, not by a loan, but by taxes to the requisite amount. With this view he brought forward what was accounted a very bold measure, namely, a project for imposing a general tax upon the income of every individual throughout the nation. Mr Pitt stated in the House of Commons his plan to be, that no one whose income was less than sixty pounds per annum should be obliged to contribute more than the taxes he already paid; but that every one who had an income of or beyond that amount should be additionally burdened, some in the proportion of ten per cent. and others at a lower rate. All who had two hundred pounds a year would be required to sign a declaration of their willingness to pay a certain sum, not less than a tenth part of their income, without particularizing the modes in which it accrued; and a scale of easy computation would be adjusted for the rest. If doubts of the fairness of the statement should arise, the commissioners might summon an individual before them, and demand upon oath a minute specification of his income; and if, on a continuance of suspicion, full proof of accuracy should not be adduced, they might fix the amount of contribution. If they should require more than a tenth, no relief would be allowed unless the books of the tradesplan, Mr Pitt mentioned the data upon which he formed by the identity of the executive power; a very insufficient

annual rent of all the land in England and Wales amount-George III. ed to twenty-five millions of pounds sterling; a sum which, by the allowance of a fifth part for the exceptions under sixty pounds, and the modifications under two hundred pounds a-year, would be reduced to twenty millions. Six millions, he thought, might be assumed as the clear income of the land to tenants, the tithes might be valued at four millions, the produce of mines, canals, and the like, at three, the rents of houses at five, and the profits of the liberal professions at two; on all these heads it might be sufficient to allow an eighth part for Scotland, which would be five millions. Income drawn from possessions beyond seas might be stated at five millions; annuities from the public funds at twelve; and those of internal trade, mechanical skill, and industry, at twenty-eight millions. These calculations formed an aggregate of a hundred and two millions; and from this source about ten millions of supply were expected to arise. This measure was opposed, without success, by Mr Tierney, Sir John Sinclair, Mr Pulteney, and others. Its chief defects were its inequality in point of principle, and the falsehood it occasioned with a view to evade it when carried into practice. Its inequality in point of principle is extremely obvious; because, under the tax upon income, a man without capital who earned two hundred pounds per annum by his industry, paid the same were usually absent. Administration was chiefly opposed tax to government with a man living in idleness and enjoying a revenue of the same amount upon a land estate. Sir William Pulteney. In the House of Lords, Earl Darn- In its collection this tax presented to merchants, and all other persons whose income depends upon their own industry, a powerful temptation to represent the amount of

the latter as extremely low. It was expected, indeed, that the vanity of appearing wealthy and prosperous would counteract this tendency; but it was soon found that, in a com-

mercial community, the love of gain is not easily subdued

by any other passion; and as a general understanding soon

prevailed among men with regard to each other's feelings

prosperous, merely because he had reported his own income to government at a low rate.

The fear of a French invasion had in a former age induced the English nation so far to overcome their own prejudices as to consent to an incorporating union with Scotland. The rebellion in Ireland, together with the dread that by means of French aid Ireland might be dismembered from the British empire, as the American colonies had been, now produced a sense of the necessity of doing that which ought to have been done three centuries before this date; that is, of uniting Ireland to Britain, by incorporating into one the heretofore distinct legislatures of the two islands. The measure was at this period very practicable, because Ireland was in fact under the dominion of forty thousand troops, who had been collected to crush the rebellion, and protect the island against the French; and because the friends of government were too much intimidated by the confusion and the scenes of bloodshed which had recently occurred there, to venture to oppose vigorously a measure which promised for the future to preserve the tranquillity of the country inviolate. On the 31st of January Mr Pitt proposed the measure in the British House of Commons. He observed, that a permanent connection between Britain and Ireland was essential to the true interests of both countries; and that, unless the existing connection should be improved, there was great risk of a separation. The settlement of the year 1782 was so imperfect, that it substituted nothing for that system which it demolished; and it was not considermen, or the ordinary accounts kept by others, should be ed as final even by the ministers of the time. It left the submitted to inspection. Having stated the outlines of his two realms with independent legislatures, connected only

1799.

nection; and if the two parliaments had differed on the subject of the war, the danger of a disjunction would have been seriously alarming. The entire dissociation of the kingdom was one of the greatest aims of our enemies; and as their eventual success in Ireland would expose Britain to extreme peril, the establishment of an incorporative union, by which their views might be effectually baffled, was a necessary act of policy. Among the advantages which would accrue to Ireland from an incorporation with Britain, he mentioned the protection which she would secure to herself in the hour of danger; the most effectual means of increasing her commerce and improving her agriculture; the command of English capital, and the infusion of English manners and English industry, necessarily tending to meliorate her condition; whilst she would see the avenue to honours, distinctions, and exalted situations in the general seat of empire, opened to all those whose abilities and talents enabled them to indulge an honourable and laudable ambition. The question was not what Ireland would gain, but what she would preserve; not merely how she might best improve her situation, but how she might avert a pressing and immediate danger. In this point of view her gain would be the preservation of all the blessings arising from the British constitution. As the supposed loss of national independence formed, in the minds of many, a strong objection to the scheme, he argued that this would be a real benefit; that the Irish would rather gain than lose in point of political freedom and civil happiness; and that though a nation possessing all the means of dignity and prosperity might justly object to an association with a more numerous people, Ireland, being deficient in the means of protection and civil welfare, could not be injured or degraded by such a union with a neighbouring and kindred state as would connect both realms by an equality of law and an identity of interest. Mr Sheridan opposed a union, as particularly unseasonable, amidst the irritation which at this period prevailed in Ireland; and he deprecated the accomplishment of the object by means of force or corruption. The measure, however, was approved of by a very large majority; and in the House of Lords the same subject was afterwards discussed with a similar result. But in the Irish parliament the proposal was resisted with such vehemence, that administration, finding themselves supported only by a small majority, thought fit to avoid pressing the matter further at this time.

During the present year the British power in India was greatly augmented, and its territory extended, by the fall of Tippoo Sultan, the son and successor of Hyder Ali. From the time when this prince had been compelled by Lord Cornwallis, in 1792, to surrender one half of his dominions, it was understood that sooner or later he would make an attempt to recover what he had lost. It would even seem that he had entertained hopes of aid from the French, and that with this view he had privately sent envoys to the Isle of France, to attempt to form a connection with the present French rulers. But when intelligence reached India of the expedition to Egypt, and the victory of the Nile, the British governor-general demanded from Tippoo Sultan an explanation of his views; and after some fruitless negociation, a British army under General Harris invaded the territory of Mysore, which they found in a bad state of preparation for war. After some slight encounters the British army encamped before Seringapatam on the 6th of April; but it was not till the 2d of May that the besieging batteries began to breach the wall. On the

Reign of tie, either in time of peace or of war, and inadequate to the 4th, during the heat of the day, the place was stormed, Reign of George III. consolidation of strength, or the mutual participation of po- and Tippoo himself perished fighting gallantly at one of George IIL litical and commercial benefits. The case of the regency the gates of the fortress. His dominions were seized by the exhibited a striking instance of the weakness of the con- British, who bestowed a portion of them upon the Mahrattas and the nizam their ally; whilst part was reserved under the direct sovereignty of the East India Company, and the remainder nominally bestowed upon a prince of the family which had lost its power by Hyder's usurpation. The substantial authority over this last-mentioned portion of Tippoo's dominions, however, was in truth retained by the British government; and as the nizam himself soon became entirely dependent upon the British power, the whole peninsula of Hindustan, with the exception of the Mahratta states, which evidently could not long remain unsubdued, might now be considered as under the dominion of Great Britain.

> In Europe the present campaign proved extremely event-The French directory had been more anxious to establish its own power at home, than careful to maintain the armies upon the frontiers and in the conquered countries in a proper state of force and efficiency. A French army under General Jourdan advanced into Suabia in the month of March, but was encountered and beaten at Stockach by the Archduke Charles. The importance of the possession of Switzerland instantly displayed itself. The vanquished French army immediately crossed the Rhine into Switzerland, and in that mountainous country contrived to make a stand during the greater part of the summer. The Austrians advanced as far as Zurich, of which they obtained possession; but before they could proceed further, the French armies, having been reinforced towards the end of the season, were enabled in their turn to assume the offensive.

> In Italy the French manœuvred unskilfully at the opening of the campaign. Instead of concentrating their forces, they attempted to retain possession of the whole of that country, and were thus beaten in various engagements at different points. The combined Austrian and Russian army was commanded by the Russian general Suwarof, who pressed upon the French with incredible activity and energy; carrying on a multiplicity of sieges, and bringing his troops together with wonderful celerity, whenever his enemy attempted to take advantage of the manner in which his forces were scattered. Macdonald, with the Neapolitan army, was defeated on the Trebbia; Moreau, who succeeded Joubert, killed at the commencement of the battle, was beaten at Novi; and in a number of combats of less magnitude the Austro-Russian army proved almost uniformly successful. The result of the whole was, that before the campaign terminated, Suwarof had driven the French out of Italy, with the exception of Savoy and the Genoese territory. But this was not accomplished without a great loss of men in sieges and battles, in which the hardy warriors of the north suffered very severely. Their leaders depended for success more upon the intrepidity of their troops, and the promptitude with which they rushed into action, than upon the skilful dispositions with which they arranged their force or harassed their enemy. Hence it happened that, amidst all Suwarof's victories, no instance occurred of any column of French troops being compelled to surrender without fighting, nor was any advantage gained but by the efforts of superior force exerted in open battle. Such a warfare, carried on against a single enemy by a combined army, could not long be successful. The Austrian officers complained loudly of their northern allies as men destitute of military skill, who wasted armies without a proportional return of conquest; whilst, on the other hand, the Russians censured their associates as destitute of proper spirit, and as protracting the war by an ill-timed caution.

Reign of 1799.

The advantage derived by the French from the posses-George III. sion of Switzerland having by this time begun to be understood, a resolution was in consequence formed to close the campaign, not by sending Suwarof from Italy into the south of France, but by directing him to turn his arms northward against the Alps. The Archduke Charles had spent the summer in pressing upon the French in that quarter, but had not been able to advance beyond Zurich; here, however, he left a considerable body of Austrians and Russians, and proceeded with a division of his army towards Manheim and Philipsburg. Suwarof advanced from Italy at the head of eighteen thousand men to take the command of these troops; but his views were anticipated by the French general Massena, who, finding the Archduke Charles and Suwarof at the distance of more than a day's march on his left and right, instantly attacked the troops stationed near Zurich. The Austrians perceiving the hazardous nature of their situation, retreated with only a moderate loss; but the Russians, from an ill-judged contempt of their enemy, total ignorance of the country, and want of skill in the art of conducting war in it, maintained their ground till they were hemmed in on all sides. They attempted to resist the French, as they had often resisted the Turks, by forming a hollow square of great strength; but neither this nor their own courage afforded any safety against the artillery of the enemy, in the face of which an iron front of bayonets was presented in vain. Their order was at last broken, and their retreat converted into an utter rout. Suwarof was at the same instant advancing rapidly to their relief; but the victorious enemy now turned quickly upon him, and attempted to encompass him on all sides. By incredible exertions, however, and following paths which were believed to be utterly impracticable, he effected his escape with about five thousand of his troops, in want of every thing, and retaining only the muskets in their hands.

> Thus terminated on the eastern side of France this active and brilliant campaign. The allies remained masters of Italy; but France was still enabled to menace that country, as well as Germany, by retaining possession of Switzerland. In the meanwhile the British attempted, with the aid of Russian auxiliaries, to drive the French out of Holland. On the 27th of August, a landing was effected under Sir Ralph Abercromby at the mouth of the Texel; and the Zuyder Zee was immediately entered by a British fleet under Admiral Mitchell. Upon this the Dutch admiral, Storey, surrendered the fleet under his command, alleging that his men refused to fight. The ships were twelve in number, and eight of them mounted from fifty-four to seventy-four guns. Here, however, the effectual success of the expedition terminated. The Duke of York afterwards assumed the command, and forces amounting to thirty-five thousand men were landed; but it was soon discovered that the invasion had been ill concerted and ill directed. To have afforded a prospect of success, the invading army should have been landed in the vicinity of Rotterdam, which was full of Scotsmen, and where the supporters of the stadtholder were numerous; and then advanced rapidly into the centre of the country, to encourage the numerous enemies of the French to come forward in favour of the invaders. Instead of this the army was disembarked at the extremity of a long and narrow neck of land, having the sea on both sides, where the French and Dutch were able to arrest their progress for a considerable time with a mere handful of troops. The unusual wetness of the season, which greatly injured the roads, also added to the diffi-British commander was at length under the necessity of withdrawing his troops to the point at which they had origi-

by which it was stipulated on the one hand that he should Reign of not injure the country, and that a number of French pri-George III. soners in England should be released; whilst, on the other hand, it was agreed that the Duke of York should be permitted to retire unmolested.

At the end of this campaign the French government underwent a new change. After the conquest of Egypt Bonaparte had invaded Syria, and subdued or conciliated most of the native tribes; but his career of victory was stopped at St Jean d'Acre by the Turkish governor of that town, assisted by the British under Sir Sidney Smith. He was forced to raise the siege of that place, after fifty-nine days of open trenches, and delivering five unsuccessful assaults; and having returned into Egypt, and destroyed a Turkish army at Aboukir, he ventured upon a step which is without example in the history of modern Europe. Having learned from an old newspaper the great reverses which the French armies had experienced in the early part of the campaign, and the general discontent produced by these misfortunes, he resolved to trust to fortune and return to France. With this view he secretly embarked, along with a select party of friends, on board a small vessel, leaving the command of his army, which was now completely insulated in the country, to General Kleber, an officer of high reputation for military genius and enterprise; and after escaping a thousand perils he landed safely at Frejus, in the south-east of France. The unexpected arrival of an officer who had never fought in Europe without success was welcomed by the public at large as a happy event; and in the first moment of joy little inquiry was made as to the manner in which he had abandoned his army, an act which in any other circumstances would have been regarded as one of the greatest of military crimes. Finding a party willing to second his views, Bonaparte now took advantage of the satisfaction occasioned by his arrival, together with the discontents arising from the corruption and mismanagement of the directorial administration, to usurp the government, cashier the directory, and to dissolve the representative legislature.

The British parliament was assembled as early as the 24th of September, in order to provide for an augmentation of force, which was thought necessary to give effect to the invasion of Holland, an enterprise of the success of which sanguine hopes were at that time entertained. The speech from the throne, after recommending the propriety of permitting to a considerable extent the voluntary service of the militia, in order to augment our forces abroad, stated that our prospects had been improved beyond the most sanguine expectation; that the deliverance of Italy might now be considered as secured; that the kingdom of Naples had been rescued from the French yoke, and restored to the dominion of its lawful sovereign; that the French expedition to Egypt had been productive of nothing but calamity and disgrace, whilst its ultimate views against our eastern possessions had been utterly confounded; that there was every reason to expect a successful result from our efforts for the deliverance of the United Provinces; and that to our ally the emperor of Russia we were in a great measure indebted for the favourable change in the general posture of affairs. It was further stated that, in pursuance of the recommendation of the British parliament, his majesty had communicated to both houses of parliament in Ireland their sentiments respecting a union with that kingdom.

In consequence of the recommendation from the throne, an act was passed, authorizing his majesty to receive into culties with which the invaders had to struggle; and the the army volunteers from the militia regiments, and some measures of finance were adopted; but government having received intelligence of the failure of the expedition nally disembarked. Here a convention was entered into, against Holland, parliament was suddenly adjourned. In

Reign of the meanwhile affairs on the Continent began to assume restoration of the princes of the house of Bourbon; that Reign of George III. a most unpropitious aspect. The emperor of Russia, such an event would at once remove all obstacles in the George III. being exasperated at the defeats sustained by his troops towards the close of the campaign, became dissatisfied irascible and unreasonable temper might lead him not merely to desert but to quarrel with them. In the meanwhile Bonaparte, under the title he had assumed of First Consul of the French Republic, resolved to signalize his acquisition of power by an attempt to procure peace. With this view he thought proper to address a letter, signed by himself, to the king of Great Britain. In this document, after announcing his own appointment to the office of first magistrate of the republic, he asked, "Is the war which for eight years has ravaged the four quarters of the world to be eternal? Are there no means of coming to an understanding? How can the most enlightened nations of Europe, powerful and strong beyond what their safety and independence require, sacrifice to ideas of vain grandeur, commerce, prosperity, and peace? How is it that they do not feel that peace is of the first importance, as well as the highest glory?" "France and England," he added, "by the abuse of their strength, may still for a long time, for the misfortune of all nations, retard the period of their being exhausted; but, I will venture to say it, the fate of all civilized nations is attached to the termination of a war which involves the whole world." letter was transmitted through the medium of an agent of the French government, who resided at London for the sake of managing the exchanges and other affairs relative to prisoners of war.

But Lord Grenville, as secretary of state for foreign affairs, informed the agent who had transmitted Bonaparte's letter, that his majesty could not depart from the usual forms of transacting business, and therefore, that the only answer to be returned would be an official note from himself. In this note his lerdship stated that the king wished for nothing more than to restore tranquillity to Europe; that he had only made war in defence of his people, against an unprovoked attack; and that it would be in vain to negociate while the same system continued to prevail in France which had ravaged Holland, Switzerland, Germany, and Italy. "While such a system therefore prevails, continued his lordship, "and while the blood and treasures of a powerful nation can be lavished in its support, experience has shown, that no defence but that of open and steady hostility can be availing. The most solemn treaties have only prepared the way to fresh aggression; and it is by determined resistance alone, that whatever remains in Europe of stability for property, for personal safety, for social order, or the exercise of religion, can be preserved. For the security, therefore, of these essential objects, his majesty cannot place reliance on the mere renewal of general professions of pacific dispositions. Such professions have been repeatedly held out by all who have successively directed the resources of France to the destruction of Europe, and whom the present rulers have declared all to have been incapable of maintaining the relations of amity. Greatly will his majesty rejoice whenever it shall appear, that the danger to which his own dominions and those of his allies have been so long exposed has really ceased; whenever he shall be satisfied that the necessity of resistance shall be at an end, and, after so many years of crimes and miseries, better principles have prevailed, and the gigantic projects of ambition, endangering the very existence of civil society, have at length been relinguished. But the conviction of such a change can result only from the evidence of facts." His lordship then went on to say, with insulting irony, that the best pledge of the reality and permanence of such a change would be the

way of negociation, confirm to France the unmolested enjoyment of its ancient territory, and give tranquillity to with his allies; and there was reason to dread that his other nations; that, however, his majesty did not limit the possibility of solid pacification to this mode, and made no claim to prescribe to France what should be the form of her government; that he only looked to the security of his own dominions, of his allies, and of Europe; that unhappily at present no such security existed, nor any sufficient evidence of the principles by which the new government would be directed, or even of its stability; and that in this situation, it remained for him to pursue, in conjunction with other powers, the exertions of a just and defensive war.

As one of the principal objects on account of which Bonaparte had commenced this negociation was probably to cast upon Great Britain the odium of continuing the war, he persevered in this purpose with uncommon dexterity. Appearing not to be disconcerted by the first rejection of his offers, he continued the correspondence through the medium of Talleyrand, his minister for foreign affairs, who, in a masterly note in answer to that of Lord Grenville, dissected the official communication of the British minister with consummate ability, and refuted the various statements and views which it embodied. He began with recriminating respecting the origin of the war, and presented a picture very differently sketched and coloured from that which Lord Grenville had portrayed in his letter. The charge of aggression brought against the French nation was haughtily repelled, and retorted on the coalesced powers, particularly on the British government. After expatiating on this subject, the French minister observed, that a sincere desire for peace ought to lead the parties to the discovery of the means of terminating the war, rather than to apologies or recriminations respecting its commencement; that no doubt could be entertained of the right of the French nation to choose its own government; that this was a point which could not be decently contested by the minister of a crown which was held on no other tenure; that at a time when the republic presented neither the solidity nor the force which it now possessed, negociations had been twice solicited by the British cabinet, and carried into effect; that the reasons for discontinuing the war were become if possible more urgent; that, on the contrary, the calamities into which the renewal of the war must infallibly plunge the whole of Europe, were motives which had induced the first consul to propose a suspension of arms which might likewise influence the other belligerent powers ;and he concluded with pressing this object so far as to propose the town of Dunkirk, or any other, for the meeting of plenipotentiaries, in order to accelerate the re-establishment of peace and amity between the French republic and Great Britain. In the answer of the British minister to this note, the recrimination of aggression was as contemptuously repelled as it had been haughtily urged. Referring to his former note, Lord Grenville observed, that the obstacles which had been presented rendered hopeless for the moment any advantages which might be expected from a negociation; that all the representations made with so much confidence by the French minister, the personal dispositions of those in power, the solidity and consistence of the new government, were points which could not be admitted as motives for opening a negociation, since these considerations remained yet to be proved; and that the only evidence must be that already explained by his majesty, namely, the result of experience and the evidence

On the 22d of January copies of this correspondence were presented to the British parliament, along with a message from his majesty, announcing that he relied on the

Reign of support of his parliament, and the zeal and perseverance of keep an army of sixty thousand men to preserve tranquil- Reign of George III his subjects, in carrying into effect such measures as would lity in the interior of France: every acr of his government George III. best confirm the signal advantages obtained in the last campaign, and conduct the contest to an honourable conclusion. On the 28th of the same month the subject was discussed in the House of Lords upon a motion made by Lord Grenville for an address of thanks to his majesty in consequence of the message. Lord Grenville contended, that nothing in the state of Europe admitted a rational hope that there was any security but in war; and that peace with a nation at enmity with order, religion, and morality, would rather be an acquiescence in wrong than a suspension of arms in ordinary warfare. He entered into a comment upon the note of the French minister, and disputed all its positions, observing that the love of peace, on the part of France, had been displayed in a war of eight years with every nation in Europe excepting Sweden and Denmark; that her disinclination to conquest had been evinced by the invasion of the Netherlands, of Italy, of Switzerland, and even of Asia; that no honourable or permanent peace could be made with the present rulers of France; and that every power with which she had treated could furnish melancholy instances of the perfidy, injustice, and cruelty of the republic. He remarked, that General Bonaparte, in the third year of the republic, imposed upon the French, at the mouth of the cannon, that very constitution which he had now destroyed at the point of the bayonet. If a treaty was concluded and broken with Sardinia, it was concluded and broken by Bonaparte; if peace was established and violated with Tuscany, it was established and violated by Bonaparte; if armistices were ratified and annulled with Modena and the other petty states of Italy, they were ratified and annulled by Bonaparte; if that ancient republic Venice was first drawn into a war, and compelled afterwards to conclude a treaty, it was that Bonaparte might more easily overthrow her constitution, and annihilate the political system by which she had existed with glory and security for ages past; if the government of Rome was subverted, it was subverted by Bonaparte; if Genoa was reduced to the same humiliating situation, her wealth and independence were sacrificed to Bonaparte; if Switzerland, deluded by offers of peace, was induced to surrender her rights and liberties, she was deprived of them by Bonaparte. He had multiplied violations of all moral and religious ties; he had repeated acts of perfidy; his hypocrisies were innumerable; and in that country where he had affirmed that the French were true Moslemins, he had given us a correct idea of his sincerity and his principles. If the interest of Bonaparte were deeply concerned, he might be sincere, and there was no doubt but it was his interest to consolidate his power; but it ought not to be forgotten, that whenever any acts of atrocity were to be accomplished by the French, they had been usually effected by a suspension of arms. The proposed negociation would relieve her from the actual pressure of alarming difficulties, but could not relieve England from any. The ports of France, which were now blockaded by our fleet and cruisers, would be thrown open to introduce naval stores, and a variety of necessary artisent to bring back the troops which were now deprived of be employed in augmenting the numbers of the French armies. To us a suspension of arms could not be productive of any benefit whatever; our ports were not blocked up, our commerce was not interrupted; and it should also be considered that there would be no security for the maintenance of such a suspension. Was Bonaparte now prepared to sign a general peace? If he were not, he could

was supported by force; and if he even were sincere, it was hazarding too much to hazard all on his single life. What reliance could be placed on the unanimity of the French people? Men of the blackest characters had been appointed to situations of the greatest trust; men infamous for professed principles of anarchy had been raised to places of confidence and power; and those who were judges in the sanguinary tribunals of Robespierre were now exalted to a distinguished rank in the republic. His lordship concluded by disclaiming on the part of administration any wish to consider the restoration of the French monarchy as the object of the war.

The Duke of Bedford opposed the noble secretary's mo-

tion, and contended, that all the objections against negociation might have been urged against the negociations whic' the ministers themselves had formerly opened at Lisle. He considered the conduct of the British government on the present occasion as unwise, because provoking and unconciliatory. He thought that, in a correspondence with the present French government, all discussion about the original commencement of the war ought to have been avoided. Whether England or France was the first aggressor, was a question to be reserved to posterity. The wild scheme of restoring the French monarchy was the sine qua non, if not of peace, at least of negociation; for notwithstanding that the noble secretary had denied the charge, yet whilst he pointed out the impossibility of treating with the French government during all its stages to the present, and insisted upon vigorous hostilities being the only means of our security, no inference could be drawn, but that the war must be continued till monarchy was reestablished. If the restoration of monarchy was not the object, what was it? Were ministers contending that we ought to wait for a more favourable opportunity of entering into negociation? Was it to be obtained by railing at Bonaparte? There were no terms sufficiently strong to censure the littleness which attacked his character, in order to ruin him in the estimation of the French nation; as if by so doing, we could negociate with more effect, or gain a fairer prospect of peace. His grace contended that no confidence was to be reposed in our present continental allies; and as a severe scarcity at this period prevailed in the country, this circumstance was made use of as an additional argument against persevering in the war. The first consul, doubtless, sought to make a peace advantageous to himself and the nation over which he presided: like all other statesmen, his motives might not be influenced by humanity: it was to be supposed his aim would be to satisfy the French people, and consolidate his own power. As to the abuse which ministers threw upon his character, it was their constant habit to abuse every ruling power in France. But whenever they had been driven by the voice of the people to negociate, their former ill language had never been any impediment. The duke concluded with a motion for an address recommending a negociation for peace.

Lord Borington supported the views of ministers. But cles, of which the country was in want; and fleets would be Lord Holland reprobated their conduct throughout the contest. At one time they asserted that the ambition all intercourse with the republic, and which might then of France was so insatiable, that she would listen to no terms; they were now driven from that pretext, and urged that a peace would be insecure. As to the ambition of the enemy, it was a consideration of weight in the arrangement of terms, not a preliminary objection preclusive of treaty. What proof could be given of the abandonment of dangerous views, but a negociation in which moderation would be displayed. Was it reasonable to suppose that not be sincere in his offers. It was necessary for him to he would admit that the guilt of the aggression lay with

1800.

Reign of France? This was a point which ought not to have been had been guilty of the original aggression in the war, and Reign of George III. discussed. The object was to treat upon actual circum-Bonaparte, desirous to attain peace by any means, should note allow him to do? He would find that the restoration of the hereditary line of kings was the only case in which a speedy peace would be admitted as possible; in fact, therefore, this restoration was the sine qua non in which immediate negociation was admissible with ministers. But surely if the ambition of the republic was so formidable, we could not forget this ground of apprehension when we talked of restoring the house of Bourbon. Had we forgotten their proverbial ambition, and was their restoration the remedy for evils arising from such a source? We had now taken up the principle, so much objected to Jacobins, of distinguishing between the people and their government. But what was the conduct of the French? Bonaparte distinctly renounced this principle in the letter to the king, and acknowledged the title and the character of his majesty's government. The note of our ministers was a manifesto to the royalists, and formed for that purpose alone. Lord Holland further stated, that the people at large disapproved of the abrupt rejection of Bonaparte's overtures; he therefore gave his most decided support to the amendment. The Earl of Carnarvon would not consider the answer of our ministers as a refusal to treat for peace, or a declaration of eternal war; it was a call upon the house and the country to pause before they rashly suffered themselves to enter into a negociation with an unsettled government. He did not expect any extraordinary faith to be manifested by Bonaparte, more than by any other chief or chiefs; but although he would be best pleased with the restoration of monarchy in France, in all times, in monarchies as well as republics, aristocracies, and every other species of government, good faith in treaties was preserved and exemplified only as long as it was the interest of the parties to maintain it. So little integrity had history left on record, that, at the very time they were signed, a secret intention was often indulged to violate them at a particular period. The address, as moved by Lord Grenville, was then carried by a great majority.

In the House of Commons Mr Dundas moved a similar address, which gave rise to a similar debate. Mr Dundas said, that the leading feature of the French revolution was a disregard of all treaties, and a contempt for the rights of other powers; and in proof of this assertion, he considered it as necessary merely to recite the names of Spain, Naples, Sardinia, Tuscany, Genoa, Geneva, Modena, Austria, Russia, England, and Egypt, with Denmark and Sweden, though at all times neutral states. Britain had not at this time any reasonable cause to suppose that a change of principles had taken place. The Jacobinical form of government was indeed at an end; but in substance and essence all the qualities of the revolutionary government were in as full force at this moment as they were in the days of Robespierre. Mr Whitbread asserted, that, had it not been for the interference and ambition of the other powers of Europe, the French revolution would have assumed a very different character from that which it now exhibited. He remarked, that other powers had treated neutral states no less unjustly than had been done by the French; Lord Harvey and Lord Hood had ordered the French ministers to be dismissed from Florence; and by threats we had compelled Genoa to dismiss her French inhabitants. He compared Bonaparte with Suwarof, and the invasion of Egypt by France with that of Poland by Austria, Russia, and Prussia, whose friendship we had frequently courted. Mr Thomas Erskine entered at great length into the question, whether France or Great Britain her of new-modelling her own government. In all this he

contended that the British government had engaged in it George III. stances and the real grounds of dispute. Suppose that unnecessarily, and persisted in it without necessity. Mr Pitt, on the other hand, affirmed that the French leaders sit down to consider how he could succeed; what does the had themselves begun the war, on the principle that it was necessary to consolidate the revolution. With regard to the proposal to negociate with their present leader, it was impossible to discuss fairly its propriety, without taking into consideration his personal character and conduct. Mr Pitt then expatiated on the conduct of Bonaparte at Campo Formio, in the Milanese, Genoa, Modena, Tuscany, Rome, Venice, Switzerland, and Egypt. His arts of perfidy, he said, were commensurate with the number of treaties; and if we traced the history of the men in this revolution whose conduct had been marked by the most atrocious cruelty, the name of Bonaparte would be found allied to more of them than that of any other within these ten eventful and disastrous years. From these facts the house might judge what reliance might reasonably be placed on this conqueror, and what degree of credit might be given to his professions. It had been observed, indeed, that whatever had been his character, he had now an interest in making and preserving peace. This was a doubtful proposition. That it was his interest to negociate, would be readily acknowledged, and to negociate with this country separately, in order to dissolve the whole system of the confederacy on the Continent; to paralyse at once the arms of Russia, of Austria, or of any other country which might look to us for support; and then either to break off his separate treaty, or, if he should have concluded it, to apply the lesson taught in his school of policy in Egypt, and to revive at his pleasure those claims of indemnification which may have been reserved to some happier period. Under all these circumstances of his personal character and his newly acquired power, what security had he for retaining that power but the sword? His hold upon France was the sword, and he had no other. But was the inference to be drawn from these considerations, that we ought in no case to treat with Bonaparte? No; but we ought to wait for the evidence of facts. At present there was nothing from which we could presage a favourable disposition in the French consuls. There was the greatest reason to rely on powerful co-operation from our allies; the strongest indication in the interior of France of a disposition to resist this new tyranny; and every ground to believe, that if we were disappointed of complete success, the continuance of the contest, instead of making our situation comparatively worse, would make it comparatively better. With regard to the negociation at Lisle in 1797, to which allusions had been made, the Jacobin system of prodigality and bloodshed, by which the efforts of France had been supported, had at that period driven us to exertions which had exhausted the ordinary means of defraying our immense expenditure, and led many who were convinced of the necessity of the war to doubt the possibility of persisting in it. Under this impression we negociated, not from the sanguine hope that its result would be permanent security, but from the persuasion that the danger arising from peace in these circumstances would be less than the continuance of war with inadequate means. Mr Fox was decidedly of opinion that France, at the commencement of the war, was the defending party. The aggressions of Austria and Prussia could not be denied by any impartial person: nothing could be more decidedly hostile than their proceedings; they scrupled not to declare to France that it was her internal concerns, not her outward actions, which provoked them to confederate against her; they did not pretend to fear her ambition, her conquests, her troubling her neighbours; but they accused

Reign of was not seeking to justify the French, either in their in- conclusion of a work so interesting to the security and Reign of George III. ternal or external policy. On the contrary, he thought prosperity of the British empire. In the House of Lords George III. their successive governments had been as execrable in various instances as any of the most despotic and unprincipled governments which the world had ever seen. Men bred in the school of the house of Bourbon, once engaged in foreign wars, would naturally endeavour to spread destruction, and form plans of aggrandisement, on every side; they could not have lived so long under their ancient masters without imbibing the insatiable ambition and restless spirit, the perfidy and the despotism, inherent in the race; they had imitated their great prototype, and through their whole career of crimes had done no more than trace the steps of their own Louis XIV. Are we for ever, continued Mr Fox, to deprive ourselves of the benefits of peace, because France has perpetrated acts of injustice? With the knowledge of these acts, we had treated with them twice, and ought not now to refuse to do so? Much had been said of the short-lived nature of military despotism; yet such was the government erected by Augustus Cæsar, which endured six hundred years. Indeed, it was too likely to be durable wherever it was established. Nor was it true that it depended on the life of the first usurper. Half of the Roman emperors were murdered, yet the tyranny continued; and this, it was to be feared, would be the case in France. On a division, however, the address was carried by a very large majority.

The great measure of a legislative union with Ireland was carried into effect during the present session of parliament. Administration had found it necessary to delay this matter in consequence of the opposition in the Irish parliament; but during the recess they had obtained a more ample majority; and as the British parliament had already, on Mr Pitt's motion, passed resolutions in favour of the union, the project was formally introduced to the Irish parliament on the 5th of February 1800, by a message from the lord-lieutenant, in which his excellency stated that he had it in command from his majesty to lay before the houses of legislature the resolutions of the British parliament, and to express his majesty's wish that they would take the same into their most serious consideration. After a long and spirited debate, the ministry prevailed by a majority of forty-three. The distinguished abilities of Mr Grattan were once more displayed on this interesting occasion. In the debate which took place on proposing the first article of the union, he opposed the measure with such vehemence, that the chancellor of the exchequer accused him of associating with traitors, and of disaffection to the government; but the reply of Mr Grattan was so pointed and severe, that the chancellor conceived himself under the necessity of resenting it by a challenge, and a meeting having taken place in consequence, he was wounded in the arm. The question, however, was carried by a considerable majority; and as the discussion proceeded, the numbers of opposition appeared to diminish. The last struggle, as it may be deemed, occurred on the 13th of March, when Sir John Parnell moved to petition his majesty to call a new parliament, in order that the sense of their constituents might be more fully ascertained; but this motion was also overruled. In the mean time the business proceeded with little opposition in the House of Lords, which, on the 24th of March, adopted the whole of the articles of union with few alterations; and soon afterwards both houses waited on his excellency with a joint address to this effect. No time was now lost in submitting the measure anew to the British parliament. On the 2d of

the measure was opposed by Lord Holland, on the ground 1800.

that a union at this time was not the spontaneous offer of the parliament of Ireland, uninfluenced by corruption or menace; but the articles were afterwards carried in a committee of the house, after some debates of no great importance. In the House of Commons Mr Pitt stated that the principal act of the treaty, that which fixed the share of representation Ireland was to have in the united parliament, was founded upon a comparative statement of the population of both kingdoms, as well as the revenue of both. The number of members fixed for the counties and two principal cities was sixty-eight; and that for the most considerable cities, towns, and boroughs, was thirtyone, who would be selected without partiality. He next adverted to the arrangements respecting the House of Peers, and the members to be returned; and observed, that as the members for the Commons of Ireland were in number nearly double those of Scotland, the same rules would be observed with the peerage, which therefore was to consist of thirty-two members. It was also understood, that such peers of Ireland as might not be among the twenty-eight temporal peers, should be allowed to sit in the united parliament until elected. The only article consisting of minute details related to the apportionment of the shares of the revenue of each country respectively. Mr Grey opposed the union on nearly the same grounds as Lord Holland had done in the Upper House. It had been asserted in a speech of the lord-lieutenant to the Irish parliament, that five sevenths of the country, and all the principal commercial towns, except Dublin, had petitioned in favour of the union. But this only meant that nineteen counties had presented petitions, and that these counties constitute five sevenths of the surface of Ireland. He admitted the petitions in favour of the union; but by what means were they obtained? The lord-lieutenant, who, besides being the chief civil magistrate, is commander of a disciplined army of a hundred and seventy thousand men, and able to proclaim martial law when he pleases, procured these petitions, which were signed by few names, and those by no means the most respectable. But fortunately there were many petitions on the other side, not obtained by solicitation and at illegal meetings, but at public assemblies, of which legal notice had been given. Twenty-seven counties had petitioned against the measure; the petition from the county of Down was signed by seventeen thousand respectable, independent men; and all others were in a similar proportion. Mr Grey then adverted to some of the principal arguments of the unionists; and concluded by moving an address to his majesty for a suspension of all proceedings relative to the union, till the sentiments of the people of Ireland could be ascertained. Mr Sheridan represented the measure as an act of tyranny towards the people of Ireland, which must become the fatal source of new discontents and future rebellions. Mr Grey's motion was, however, rejected by an overwhelming majority.

Early in the session mention had been made by opposition of the unfortunate invasion of Holland by the British forces; but ministers declined entering upon the subject, as the expedition had been carried on under the superintendence of Mr Secretary Dundas, and that gentleman, soon after the meeting of parliament, had gone down to Scotland in the depth of winter, without any ostensible business; a circumstance which gave rise to suspicions April, a message from his majesty was presented to both that some dissatisfaction existed at court on account of the houses of parliament, communicating the resolutions of result of the Dutch invasion, or the manner in which the the Irish parliament in favour of an incorporating union Duke of York had been supported in it by the adminisbetween the two kingdoms, and recommending the speedy tration at home. On the 10th of February, however, the

Reign of subject was introduced in the House of Commons by Mr they had no waggons at all, and could not possibly have Reign of George III. Sheridan, who moved for an inquiry into the causes of its failure. He treated the capture of the Dutch navy as of little value, or rather as pernicious, on account of the example of mutiny which it exhibited on the part of the seamen whom we had received into our service; he admitted that the restoration of the stadtholder was a justifiable motive for our interference, but contended that Britain had treated the people of Holland ill, by obliging them to enter into the present war, and avoiding to promise a restoration of their colonies in case of a successful invasion; he asserted that the expedition itself was ill arranged, as the army after its landing had no means of moving forward on account of the want of necessaries, and, instead of delivering the Dutch, was under the necessity of entering into a capitulation for its escape, and of holding out, as an inducement to enter into this capitulation, a threat of destroying for ever the commerce of that very people whom we had embarked to save; and he contended, that to vindicate the honour of the British army, it was necessary to inquire into the cause of its misfortunes upon this occasion. Mr Dundas defended the expedition against Holland with his usual dexterity. He stated its object to be threefold: first, to rescue the United Provinces from the tyranny of the French; secondly, to add to the efficient force of this country, and diminish that of the enemy, by gaining possession of the Dutch fleet; and, lastly, by hostile operations in Holland, to oblige the French to weaken their armies in various other quarters. Mr Dundas contended, that at the commencement of the expedition a great probability existed of the success of all these objects; two of them did actually succeed, and only one failed. With regard to the capture of the fleet, he declared himself astonished that a doubt should exist about the value of such an acquisition. That fleet had been absolutely destined for the invasion of our dominions; along with it we took nearly seven thousand seamen, all of whom were liable to be employed in the French fleet, and forty thousand tons of shipping, which might have annoyed our commerce. By the invasion of Holland, also, the French had been compelled to weaken their other armies, which gave success to Suwarof in driving them from Italy, and to the archduke on the Upper Rhine and in Switzerland. They had indeed succeeded in defending Holland; but, as the price of this success, they had been severely pressed in every other quarter. At the moment our enterprise was undertaken, it was doubtful whether they would send their reinforcements thither, or to other parts of the Continent. They had poured prodigious reinforcements into Holland, by which means we were unable to rescue it from their yoke; but the result was, that they had lost every other point which they had contested during the whole campaign. With respect to the conduct of the enterprise, never was a commencement more prosperous than that of the late expedition. Sir Ralph Abercromby had sailed for the Helder on the 13th of August, and every thing promised the most rapid success. On the 14th came on the most extraordinary hurricane that ever blew from the heavens; it was found impossible to land a single soldier on any part of the coast of Holland; and this continued till the 27th. The consequence was, that the enemy knew where our army must land, and their troops came in shoals to oppose us; seven thousand men were collected; and as they were superior in number, Sir Ralph could not land his men to advantage. The ardour of the soldiers and the gallantry of the commander were never excelled on any occasion. Without any thing but their muskets and bayonets, against cavalry and artillery, they made good their landing, and by it they secured the Dutch fleet. It was alleged that

landed them had they been there. Instantly on their land- George III. ing they could not want them; for all they had then to do was to secure a landing place and a post of communication. Sir Ralph had to consider what position he should take till the 1st of September, when reinforcements would arrive. The same tempest prevented the Russian troops from arriving to reinforce the army; they did not come till the 18th. The Duke of York offered to the Russian general, D'Hermann, to delay the attack, if he thought his men were not sufficiently recovered from the fatigues of the voyage; but the general requested that the attack should be made, with a promptitude and alacrity which reflected the highest honour upon him; and this ardour led him into the field two hours sooner than the time appointed. The army, however, was gloriously successful until a late hour in the day. General d'Hermann and his troops were in possession of the village of Berghen, and crowned with victory, till his zeal led him beyond a given point, and turned the fate of the day. When the attack was made the French amounted to seven thousand, and the Dutch to twelve thousand men; yet, notwithstanding this superiority of force, our troops fought and conquered; but the French continually pouring in reinforcements, the duke was advised to accede to the terms of an armistice, which was by that time mutually wished for. The duke yielded to this advice; and, by so doing, consulted the dictates of reason and humanity. Mr Dundas contended that our army returned with as much honour as they entered Holland. The Duke of York, indeed, agreed to give up eight thousand French prisoners on condition that his retreat should be unmolested; but he could not be wrong in doing so, because our prisons were overloaded with them; and he did not recede from any one article in which national dignity was concerned.

Mr Tierney supported the proposal for an inquiry. He disputed the advantages said to result from the expedition, and contended, that to a secret committee, or in some other form, ministers ought to account for their conduct, and exonerate themselves from suspicions too strong to be removed without proof. It was unconstitutional, and an insult on the house, to say this could not be done consistently with the preservation of secrecy. General Abercromby landed on the 22d of August with ten thousand men; he got possession of the Helder; he was reinforced by General Don on the 27th. Was it not strange that fifteen thousand men, headed by an able general, and going by invitation, should think it imprudent to advance? Had the Dutch been well affected, why did they not declare themselves? No French troops were then in Holland to keep them in awe. Why did not the Duke of York sail at the same time with General Don? Why were all our forces sent to one place, and forty-three thousand men cooped up in a narrow peninsula where but few could act at a time? It was strange that ministers, who were so fond of making diversions, did not think of making a diversion in some other quarter. This was a point which only military men could determine; and the house was bound to examine officers, that the truth might be known. The capitulation, he said, had fixed an indelible blot on the national character. A king's son, commanding forty thousand men, had capitulated to a French general who had only thirtyfive thousand. Mr Addington observed, that having maturely and dispassionately considered the nature of the proposed inquiry, it appeared to him to rest upon two grounds: first, the propriety of judging any measure by its event; and, secondly, that in consequence of a failure, there was a necessity for investigation. It ought to be recollected, that the worst concerted plans had often prothe troops had no means of drawing their waggons; but duced the most brilliant success, and the best terminated

Reign of in disaster. No human being could command success, and French troops continued to hold possession. Bonaparte Reign of George III no existing government control the elements. The pro-

majority.

During the present year the war proved extremely eventful. The army which Bonaparte had left in Egypt under General Kleber being disgusted by the desertion of their leader, a negociation was entered into by Kleber with the Turkish grand vizier and Sir Sidney Smith; the result of which was, that the French agreed to abandon the whole of Egypt, on condition of being permitted to return unmolested to France. The convention was concluded at El Arish on the 24th of January; and the immediate return of this discontented army to France might have proved dangerous, if not fatal, to the newly-established power of the first consul. But here the usual for-tune of Bonaparte prevailed. The British government, suspecting that some proposal of this kind might be made, sent secret orders to Vice-admiral Lord Keith not to consent to any arrangement which might leave so large an army at liberty to act in Europe, or which should not include the surrender of all the ships in the port of Alexandria. The consequence was, that Lord Keith refused to ratify the treaty of El Arish which Sir Sidney Smith and the Turkish grand vizier had concluded, and detained as prisoners General Dessaix and a number of troops which had been sent from Egypt. The French general Kleber immediately intimated to the Turks a determination to resume hostilities. He attacked and totally routed their army, consisting of forty thousand men, in the neighbourhood of Grand Cairo; and multitudes perished by slaughter and in the desert, while the French remained complete masters of the country. When it was too late, an order arrived from Britain to permit General Dessaix and the troops along with him to land in France, and to fulfil every part of Sir Sidney Smith's treaty; but the state of affairs had changed; Kleber had been assassinated by a fanatical Arab, and his successor, Menou, refused to evacuate Egypt; so that it became necessary, at a future period, to send an army from Britain to drive the French out of the country which they had proposed to evacuate without firing a shot or shedding a drop of blood.

The Austrian armies in Germany and in Italy were respectively commanded by General Kray and by General Melas. The campaign was conducted on the part of the French government with great ability and decision. It had been publicly announced in all the French newspapers that the armies were to be reinforced as powerfully as possible; and that an army of reserve was to be formed in a central position between Germany and Italy, from which the armies might be supplied with fresh troops according to the events of the war. Dijon was mentioned as the head-quarters of this army of reserve, and it already amounted to upwards of forty thousand men. Nobody suspected that any important plan of operations or military stratagem was concealed under the affected notoriety of this arrangement. Accordingly the Austrians commenced the campaign by an attack upon Massena in the Genoese territory; and after a succession of obstinate conflicts the French were driven into Genoa, where they sustained a siege, till compelled to surrender from want of provisions. Whilst Melas besieged Genoa, and even pushed forward his parties through Nice into the ancient French territory, Bonaparte in person suddenly repaired to Dijon and joined the army, to the assembling of which Europe had paid little attention, on account of the appellation which it had received of an army of reserve; and immediately advancing, he crossed the Alps by the Great St Bernard, and descended into the Milanese with little opposition. At the same time powerful reinforcements joined him from Switzerland, of which the

thus placed himself in the rear of the Austrian general, and George III. posed inquiry was accordingly negatived by a very large hazarded every thing upon the fortune of a single battle. He was accordingly attacked on the plain of Marengo, near Alessandria; and, as the Austrians were greatly superior in cavalry and artillery, they proved victorious during the greater part of the day. The French wings were turned, the centre division was broken, and scarcely six thousand men stood firm at any one point, when General Dessaix, late in the action, arrived with a reinforcement of six thousand troops, though fatigued by a rapid countermarch of several leagues. At this moment the battle seemed to be irretrievably lost. The French had been thrown back in the utmost disorder upon Montebello, where Lannes was still maintaining a furious though desperate resistance; the whole field of battle was in possession of the Austrians; the French troops were crowded together in a disorganized mass, in which the enemy's artillery were committing the most frightful havoc; and only one effort more seemed necessary on the part of the Austrians, with their fine cavalry, in which arm they were greatly superior, to complete the destruction of the French army. Matters were in this state when Dessaix arrived, who, perceiving the desperate situation of affairs, instantly hurried his division into action. Surprised at, but not unprepared for this renewed attack, the Austrians developed a powerful force to oppose it; Dessaix fell mortally wounded; and his division were on the point of being overwhelmed, when an event almost unexampled in war not only saved the French army from destruction, but totally changed the fortune of the day, and converted a disastrous defeat into a complete victory. While a body of Austrian grenadiers, six thousand strong, were advancing to the charge along a broad causeway, and carrying all before them, they were suddenly and furiously attacked in flank by General Kellerman, at the head of six hundred horse, which he had managed to conceal among some mulberry trees. A panic immediately seized them, and believing themselves assailed by the mass of the French cavalry, they threw down their arms. The whole affair passed in an instant, and even the victors themselves were astounded at their own success. Bonaparte, however, lost not a moment in profiting by this extraordinary turn of fortune. The French rallied with their usual promptitude on Dessaix's division, which still preserved some degree of order; resumed their former positions; recommenced the battle, which they had a few minutes before given up for lost; and, animated with the enthusiasm inspired by Kellerman's extraordinary success, drove the Austrians from the field. In the French official account of this memorable conflict, which decided the fate of all Italy, no mention whatever is made of Kellerman's gallant and decisive attack; and it reflects little credit on the memory of Bonaparte, that, though he afterwards heaped wealth and titles in boundless profusion on the man who had not only saved him and his army from destruction, but converted a disastrous defeat into a splendid triumph, he should never have made any public admission of the unparalleled achievement which changed the fortune of the day. The service was probably considered as too great to be acknowledged, because it could never be sufficiently rewarded; and it ill comported with the character of Bonaparte to admit that, in genius, promptitude, and energy, he could ever be surpassed by any of his lieutenants. On the following day Melas entered into negociation, and, as the price of an unmolested passage to the Austrian states, he agreed to abandon all Piedmont, and

1800.

est fortresses in Europe. On the side of Germany the French under General Moreau were scarcely less successful. They passed the Rhine

the basin of the Po, and to surrender twelve of the strong-

Reign of in the neighbourhood of Strasburg, where they were op- prohibition of exportation of provisions was unnecessary, Reign of George III posed by the Austrians. But this was only a feigned attack. Speedily retreating, the main body of their army descended from the mountains of Switzerland, and crossed the Rhine in the rear of the Austrian army near Schauffhausen. After a desperate engagement, the Austrians four thousand were taken prisoners. As the mode of attack had been unforeseen, and was consequently unprovided for, the loss of magazines and baggage was immense. In another and harder fought battle, at Moskirch, the Austrians lost upwards of eight thousand men. At Biberach, Augsburg, and Hochstet, the French were equally successful; and the result was, that the Austrians were under the necessity of crossing the Danube, leaving the French masters of the electorate of Bavaria, and in a condition to invest Ulm. A general suspension of hostilities was now agreed to, by which both parties retained possession of their actual positions; and a negociation for peace was entered into between the French and Austrians, which produced an attempt to negociate on the part of Great Britain; but as the French also demanded a naval armistice, the negociation was dropped; and after a considerable delay, during which the Austrian minister at Paris concluded a treaty which his court afterwards disowned, preparations were made for re-opening the campaign. But the French ultimately consented to renew the armistice with the Austrians, on condition of obtaining possession of the important fortresses of Ulm, Ingoldstadt, and Philipsburg. These armistices and negociations proved of great service to the French. The consent to a truce in the midst of an unexampled career of victory gave an appearance of moderation to the new consular government; whilst the conclusion of a treaty at Paris, to which the Austrian government afterwards refused to adhere, induced neutral nations to consider Bonaparte as anxious for the attainment of peace. Hence the wonderful success which attended his arms, during the early part of the campaign, was far from rousing the jealousy of the other states of Europe. The northern nations eagerly courted his alliance; and the emperor Paul of Russia, actuated by the natural instability of his temper, and an admiration of military success, not only entered into a close alliance with Bonaparte, but seized the British vessels in his ports; whilst the Danes, Swedes, and Prussians, formed a confederacy for evading the right claimed in war by maritime states, of preventing their enemies from being supplied with naval stores by means of neutral vessels.

In the meanwhile Great Britain was greatly distressed by a scarcity of provisions, and riots broke out in London and some provincial towns. On this account parliament assembled on the 11th of November, and the principal discussion which occurred in it related to the scarcity which prevailed throughout the country, and involved in great difficulties both the middle and lower classes The members of opposition asserted that of society. the war and the scarcity were closely connected; whilst Mr Pitt and his colleagues contended that a more obvious cause might be found in the deficiency of the two preceding crops, owing to cold and rainy seasons. A royal proclamation was issued in the beginning of December, exhorting all heads of families to reduce the consumption of bread by at least one third, to abstain from the use of flour in pastry, and to restrict the consumption of oats and other grain by horses; and acts of parliament were at the same time passed prohibiting the exportation, and offering bounties upon the importation, of grain. These measures, however, were of a very doubtful character. By increasing the alarm of scarcity they induced wealthy persons to buy up grain, and to withhold it from the markets; the

when a better price could be obtained in Britain than else-George IIIwhere; and the same high prices afforded a sufficient bounty for importation.

1801

At the commencement of the following year government laid an embargo on all Russian, Danish, and Swedish ships were defeated with the loss of ten thousand men, of whom in British ports; so that Great Britain was now at war with nearly all Europe. Austria, indeed, ventured to renew hostilities; but the French general Moreau, having defeated the Archduke John with tremendous loss, at Hohenlinden, drove back the Austrian army upon their capital, advancing within seventeen leagues of Vienna; whilst at the same time signal defeats were sustained by them both in Italy and in Franconia. From the necessity of their affairs, therefore, the Austrians were compelled to sue for peace, which was accordingly concluded at Luneville. The Netherlands and the Milanese were resigned; France extended her boundary to the Rhine; and Tuscany was relinquished by the grand duke, who was to receive an indemnification in Germany; whilst, on the other hand, the city of Venice and a portion of its ancient territory were given up to Austria. The German princes who suffered by the treaty were to receive an indemnification out of the ecclesiastical states of the empire; thereby weakening still further the influence of the house of Austria. By this treaty the French became masters of Europe to the southward of the Rhine and of the Adige.

The commencement of the year 1801 was marked in Great Britain by the termination of Mr Pitt's administration. When this event was announced to the public, it created no small degree of astonishment. Since Mr Pitt had come into office a new generation had sprung up; and a succession of the most extraordinary public transactions had occurred, amidst all of which that minister, with his kinsman Lord Grenville, and his friend Mr Dundas, had remained firmly established in power. The authority and influence of these men had in some measure interwoven itself in the opinions of the people, and they were surrounded by a train of powerful adherents, dependent on their patronage; whilst, at the same time, Mr Pitt himself retained such a degree of popularity as caused his dismission or resignation to appear a very bold measure in the present state of affairs. The ostensible cause assigned for Mr Pitt's dismission obtained little credit with any one. He was represented as having promised to the Irish Catholics an equalization of privileges with their fellowsubjects, on condition of their acquiescing in the treaty of union; but it was pretended that, since his majesty had been persuaded to oppose the measure, as contrary to his coronation oath, the ministry, in such a state of matters, could no longer honourably remain in office. Of the true cause of this change little is publicly known. It does not seem necessary, however, to search into secret history for an explanation of a transaction which may be sufficiently accounted for on principles which must be obvious to all. The influence acquired by Lord North, arising from the patronage he enjoyed during the American war, enabled him, by combining with others, to establish a formidable interest in the legislature. But the power possessed by him was trifling when compared with that which Mr Pitt and his friends possessed. The war which Mr Pitt had conducted had been expensive in a degree altogether unexampled in preceding times; whilst the circumstances under which it commenced had united, as a party under him, almost all the persons of property in the kingdom. During his long administration, too, the crown possessed, in a more direct manner than formerly, the increasing patronage of India; and hence the leading members of this administration might be regarded as having attained a degree of power and influence which could not easily be shaken;

George III by any combination of subjects in a free country. In such circumstances, it was natural for an experienced prince to wish for a change. Mr Pitt had been originally taken into office as the agent of the crown in the House of Commons, to support the royal prerogative there, against a combination of powerful and accomplished men; he had enjoyed great popularity, and had been considered as the man best qualified to conduct the war of the French revolution; and as he knew the high rank which he held in public estimation, and treated the House of Commons with but little deference, it is not improbable that in the cabinet he may have presumed upon the indispensable importance of his own services, and, accounting himself necessary to the administration of the empire, arrogated a degree of independence not at all graceful nor becoming in a mere instrument of the crown. Some, however, have thought that his retirement on this occasion is to be ascribed to a totally different cause; that as he had been mainly instrumental in plunging the country into the war with France, and as all his schemes for humbling that nation had proved abortive, he could neither admit his error, nor adopt the only means which now remained, in some degree to atone for it; and that he desired to escape the mortification of negociating a peace with a power which he had so often denounced, and which he wished to exclude from the pale of political and social relations in Europe. And, in support of this view, it may be mentioned that, on the dismissal of this administration, a resolution appears to have been at the same time adopted by the British court, seriously and earnestly to endeavour to obtain peace upon any tolerable terms.

With regard to the general merits of Mr Pitt's administration, we are still probably too much involved in the passions and prejudices which it excited to be able to appreciate them with sufficient candour and intelligence. He derived great advantage from the copious and stately eloquence which he at all times displayed in the House of Commons; and certainly no man ever possessed so completely the art of managing the people of England, and retaining their attachment, at the same time that he continued to possess the confidence of his sovereign. Although he obtained the government of the British empire at a very youthful age, the prudence of his conduct and the magnitude of some of his designs entitle him to a very high rank as a statesman. His sinking fund, though not contrived by himself, and though based on erroneous principles, was a great and important measure, as it contributed to sustain the national credit at a period of unexampled difficulty and embarrassment, and enabled the country to weather a contest which might otherwise have proved fatal to its independence. His commercial treaty with France was also, whatever the political economists may say to the contrary, a measure recommended by the soundest wisdom. The most ambiguous circumstances in Mr Pitt's public conduct were those which related to parliamentary reform, to the trial of Mr Hastings, and to the slave-trade, in which he adopted the popular side in the debate, although the court was known to be hostile to his avowed sentiments, which accordingly were never successful. The most difficult question relates undoubtedly to the war with France. Though by the forms of the British constitution Mr Pitt was responsible for engaging in this war, and for continuing in it, yet as he was not actually the head of the state, it is possible that the interference of Britain might not originate with him, and that he consequences, the enormous aggrandisement of France, as nothing more than a nominal minister, holding a tem-

Reign of and which might prove extremely inconvenient, when held the subjugation of the weaker states, and the accumulation Reign of of that intolerable load of debt which hangs like a mill-George III. stone round the neck of this country, and encumbers every effort it can make to develope its natural resources. Had Britain originally remained neutral, or rather, had she negociated in favour of the independence of France, brought into hazard as it was by the combination of the great military powers, that country would have been confined within her ancient boundary; Italy, Switzerland, and Holland would have retained their independence; and the strength of Austria would have remained unbroken; or, if Britain had withdrawn early from the contest, and avoided urging and subsidizing the continental powers, until they were successively vanquished, the same result might have ensued. On the other hand, if the war is to be considered as undertaken to overturn the principles of the French, it was undoubtedly successful to a certain extent, as it compelled them to abandon these principles, and to have recourse to a military usurpation; but it ought to be remembered, that to Britain as a nation the political principles of the French were of no importance whatsoever, whilst their permanent aggrandisement was calculated to bring into hazard our very existence as an independent nation. Mr Pitt and his friends called forth the resources of the country for the support of the war to an astonishing extent. Immense treasures were lavished in supporting our allies in fruitless or absurd expeditions, and in schemes which served only to augment the public burdens, and to increase the influence of the crown by the extension of its patronage. The acquiescence of the public in the war was preserved by keeping the minds of men in a state of constant alarm, from the fear of danger to the constitution, in consequence of the alleged disaffection of a body of the people; and in this manner a constant spirit of persecution was maintained throughout the country, which thus seemed to be ruled rather by a jealous faction than by a legitimate government. The concluding measure of Mr Pitt's administration, the union with Ireland, is entitled to much praise. It was suggested by the course of events, and tended to remedy a great defect in the constitution of the British empire, the want of consolidation into one united political body.

Of the associates of Mr Pitt, Lord Grenville, who acted as minister in the House of Lords, was the principal in England, and Mr Dundas in Scotland, and perhaps also in the rest of the empire. This last gentleman possessed the greatest share of power ever intrusted to any Scotsman since the union, excepting for a short time to Lord Bute. During a considerable length of time he appears to have conducted almost the whole public business of that vast assemblage of nations, in all the climates of the globe, which constitutes the British empire; and under his patronage, and that of his friend Mr Pitt, a numerous body of dependents rose to the possession of boundless opulence; whilst they themselves, engrossed by the pursuits of ambition, were understood to have been somewhat careless of their private concerns.

At the time when the change of ministry took place the king became affected with a severe illness, supposed to be the result of anxiety and agitation of mind. In making choice of a new prime minister, however, he avoided admitting into power the party which had opposed the war; and selected Mr Addington, who, as we have already mentioned, was originally patronized by Mr Pitt, and who, as speaker of the House of Commons, had gained approbation by his good temper, prudence, industry, and conciliating manhad only the alternative of engaging in the war or of re- ners. This gentleman appears to have obtained from his linquishing his power. If the war is to be considered as predecessors in office a promise of support in parliament; advised and conducted by him, he is responsible for all its and he was therefore represented throughout the country

1801.

Regn of porary situation, which, on the first opportunity, he was to from protecting the commerce of France on the seas or in Reign of retained in the nomination to all inferior offices. Mr Addington's appointment as first lord of the treasury and chancellor of the exchequer was followed by the nomina-Lord Hawkesbury as secretary of state for the foreign department, of Lord Pelham for the home department, and of Colonel Yorke as secretary at war. Lord Eldon was succeeded by Sir Michael Pepper Arden, then created Lord Alvanley, as chief justice of the common pleas; and Mr Addington by Sir John Mitford, afterwards Lord Redesdale, as speaker of the House of Commons. Sir William Grant was made master of the rolls, and Mr Law and Mr Percival attorney and solicitor generals.

On the 2d of February the parliament of Great Britain and Ireland was opened; but as the king's illness immediately succeeded that event, the new administration did not obtain formal possession of office until the month of March, and during the interval the old ministers continuthe throne expressed great satisfaction that the crown would now be able to avail itself of the advice of the united parliament of Great Britain and Ireland; hoped that this memorable era, distinguished by a measure calculated to consolidate the strength of the empire, would be equally marked by the energy and firmness which the present situation of the country so peculiarly required; and stated that the court of Petersburg had treated our representations of the outrages committed against our ships and property, and against Englishmen, with the utmost disrespect, and that acts of injustice and violence had aggravated the first aggressions. It mentioned that a convention had been concluded between Petersburg, Copenhagen, and Stockholm, the avowed object of which was to establish a new code of maritime law, inconsistent with the rights and hostile to the interests of this country; and that the earliest measures had been taken to repel this confederacy, and to support those principles essential to the maintenance of our naval strength. It recommended an inquiry into the high price of provisions, and promised a termination of the present contest whenever it could be done consistently with security and honour.

When the usual address was moved, some discussion occurred in both houses regarding the actual state of affairs, more particularly as connected with the combination of the northern powers against Britain. In the House of Commons Mr Grey deplored the prospect of a war with all Europe. Russia had evidently been guilty of the grossest violence and injustice towards this country, in the confiscation of the property of our merchants, and in the treatment of our sailors; but the emperor accused the British government of violating a convention by which he was to receive the island of Malta as the reward of his co-operation against France; and the truth of this assertion ought to be investigated. Concerning the northern confederacy, Mr Grey remarked, that the principles on which it was founded were of no recent origin, as indeed was very generally known. Mr Pitt, who still acted as chancellor of the exchequer, declared, that with every one of the three northern powers, independently of the law of nations, we had on our side the strict letter of engagements by which they were bound to us. In the convention signed between Great Britain and Russia, the latter hound herself to use her efforts to prevent neutral powers

George III. relinquish in favour of Mr Pitt and his friends. And this the ports of France; and Denmark and Sweden had ex-George III. account of the state of affairs derives plausibility from the pressed their readiness to agree on that very point which actual support which the new minister received from these they were now disposed to contend. We did not indeed gentlemen, and from the influence which they evidently know the precise terms of their new convention; but as its existence and general object were acknowledged, we must necessarily act upon the supposition of their hostility.

In March Mr Grey moved for an inquiry into the state tion of Lord Eldon to the office of lord high chancellor, of of the nation. We were now, he said, in the ninth year of Lord St Vincent to that of first lord of the admiralty, of a war with France, and threatened with a war by all the maritime states of Europe, if not actually involved in it; we had added L.270,000,000 to the capital of our national debt, and above L.17,000,000 to our annual taxes; we found ourselves opposed to France, which was now extended in territory, increased in population, and supported by all the states of the north. We were opposed to her with diminished means, exhausted strength, and stripped of every ally. It was, therefore, incumbent on the representatives of the people to enter into a serious inquiry into the means most likely to restore to us security and happiness. The conquests we had made during the war had not compensated our disasters or the acquisitions made by France. Her frontier now extended to the Rhine, to the Alps, and to the ocean; yet all these possessions ed to hold their former situations. At the opening of the we had consented to abandon as the price of peace which imperial parliament, as it was now called, the speech from ministers might have made with France confined within her ancient limits, while our own country was prosperous and happy. Our losses were thus irretrievable, and our triumphs empty. There was almost no shore from the Texel to the Adriatic which had not witnessed the defeat of our forces and the disgrace of our arms. The unfortunate attempt upon Dunkirk, the shameful retreat through Holland, the evacuation of Toulon, the abandonment of Corsica, and the expedition to Quiberon, were all fatal proofs of ill-concerted schemes; but the late expedition against Holland was more disgraceful than the rest, because it terminated in a capitulation to an inferior force. Administration had acted with such imprudence that even our very allies were now converted into enemies. The Swedes and other neutral nations had complained that their trade was molested, their ships detained, and justice refused them in our courts, or so long delayed that it was useless. These were points which undoubtedly deserved investigation. Nor did the internal condition of the country less require consideration. The sum of L.270,000,000, as already mentioned, had been added to the national debt, exclusive of imperial and other loans, and the reduction by the sinking fund; and yet the ex-ministers alleged that they left the country in a flourishing condition. Yet every Englishman, from diminished comfort, or from positive distress, felt this declaration to be an insult. The situation of the sister kingdom was also alarming in the extreme. Since the recal of Earl Fitzwilliam, Ireland had been the scene of transactions shocking to humanity. Was it now tranquil? Though rebellion had been crushed in the field, it lurked in secrecy; the mass of the population was disaffected; and nothing prevented the separation of Ireland from Britain but the inability of France to send a force to assist the rebels. Upon these grounds he called for an inquiry into the actual state of affairs, and demanded the support of the new administration, as a testimony of their disapprobation of the measures of their predecessors.

Mr Dundas defended, with plausible statements and arguments, the conduct of the war. The principle which he laid down was, that war ought to be directed to the destruction of the commerce and colonial possessions of the enemy, including their maritime power, which must depend upon their commerce. It was hardly possible for England to be long at war with France without being in-

Reign of volved in disputes on the Continent, which might deprive George III us of many of the markets which we had for our goods; and therefore it was peculiarly our interest to gain these colonies, that they might remain open for our commodities. In order then to judge how far the war, conducted on this principle, had been disastrous and disgraceful, he would state its progress and success. Hostilities commenced against France in February 1793; and in that year Tobago, St Pierre, Miquelon, Pondicherry, part of St Domingo, and the fleet at Toulon, were taken, besides the possessions of the Newfoundland fishery. In the year 1794 we captured Martinique, Guadaloupe, St Lucie, the Saints, Corsica, and Mariagalante; in 1795, Trincomalee and the Cape of Good Hope; in 1796, Amboyna, Berbice, and Demerara; in 1797, Trinidad, with four ships of the line either taken or destroyed; in 1798, Minorca; in 1799, Surinam; in 1800, Goree, Malta, and Curaçoa. These had been our successes. With regard to the expedition against Holland, he defended it on the same principles as formerly. As to the navy, he stated, that since the commencement of the present war we had taken or destroyed eighty sail of the line belonging to the enemy, a hundred and eighty-one frigates, two hundred and twenty-four smaller ships of war, seven hundred and forty-three French privateers, fifteen Dutch and seventy-six Spanish ships. The losses we had sustained were three sail of the line, one of which we had retaken; one fifty gun ship, which we also retook; and of the frigates captured by the enemy, the Ambuscade alone remained in their possession. One of the great advantages to be derived from the colonial possessions of the enemy was the markets they furnished for our manufactures. In the year 1793 the manufactures sent from this country to the West Indies amounted to above L.1,800,000 sterling. Before the war our exports to the East Indies did not exceed one million, but in the preceding year they exceeded L.1,600,000, a proof that we had not lost the markets of Europe. The failure of an expedition was now considered as a decisive proof of misconduct in ministers; but in the glorious Seven Years' War, which was in every body's recollection, there were expeditions attempted which completely failed, though the failure was not considered as a proof of incapacity or neglect in Lord Chatham. The conquests which we then made were Senegal, Louisburg, St Lucie, Duquesne, Guadaloupe, Martinique, the Havannah, Montreal, Pondicherry, Grenada, Belleisle, besides destroying the fortifications of Cherbourg; and we took or destroyed thirty-two sail of the line and fifty-eight frigates, besides a proportionable number of smaller vessels. We were now in possession of every place taken in that war, excepting Guadaloupe, the Havannah, and Belleisle; but, on the other hand, we had gained the Cape of Good Hope, Ceylon, Demerara, Berbice, and all the Dutch possessions in the East and West Indies, added to Minorca and Malta. We had also destroyed the confederacy formed against us in the East Indies, and acquired a great increase of power and territory in that quarter of the world.

Mr Pitt, after expressing his respect for the new administration, observed that no point had been more disputed than that of confidence in ministers. By some people it given proofs of having merited it. But this never could be carried in substance to the letter; for whoever entered into any employment, must at first be new to it: there could be no experience without trial; but when persons had been tried in one situation, and had acquitted themselves well in it, it was a rule to give them credit when they entered into another, until proof of their incapacity or misconduct appeared. He then lavished encomiums on Mr Addington, on Lord Hawkesbury, and on Earl St Vin-

cent, and asked the gentlemen of the opposition if they Reign of knew any one among themselves superior to Lord Hawkes- George IIL bury, excepting one, Mr Fox, whose transcendent talents made him an exception to almost any rule. Of the other individuals composing the new administration, much might be said; but he would only add, that it showed little reflection or consideration to affirm that the present ministers were unentitled to a constitutional confidence; and the house was bound by the best principles of policy to wait to see the conduct of the servants of the crown before they withheld it. Upon the subject of the retirement or dismissal of the late administration, he contended that his majesty had a right to part with his servants, and his servants to retire, without any explanation being given to the public. Concerning the affairs of the Irish Catholics, and their connection with the dismissal of administration, he stated, that a memorandum had been sent, in the name of a noble lord at the head of the executive government of Ireland, who thought it essential to communicate the grounds of the change of administration to persons more immediately connected with the Catholics; and it had been at his express desire that this communication had been made, and the motives explained to them which led to the change, in order to prevent any misrepresentation. Emancipation of the Catholics was a term he disclaimed. He never understood the situation of the Catholics was such as to need what deserved to be called emancipation; but he thought the few benefits which they had not yet anticipated might easily have been added to those so bountifully conferred on them in the present reign, not as a matter of right, but of liberality and political expediency. Had such a measure preceded the union, indeed, it would have been rash and destructive; and even now, if any attempt was made to push it so as to endanger the public tranquillity, or to pervert the affections of any of his majesty's subjects, the ex-ministers would be forward and firm in resisting it. But he hoped the day would come when such a measure might be revived, and carried in the only way in which he wished to see it carried, conformably to the general tranquillity of the empire. To him it had appeared of such importance, that, being unable to bring it forward as a measure of government, he did not conceive it possible for him, with honour, to remain in the same situation; and he wished it to be understood, that whenever the same obstacles did not exist, he would do every thing in his power to promote its success. He denied, however, that any of those who had retired from office had so pledged themselves to the Catholics as to be under the necessity of resigning their offices because they could not perform their promise and he also denied that ever the Catholics supposed they had received such a pledge. An expostulation was natural, but a pledge had never been given. He concluded that the British government had justice on its side, or rather was supported by the law of nations, in the claims which it now maintained to search neutral vessels for military stores on their way to the enemy, and to declare particular French or other ports under blockade, to the effect

tempting to enter them. Mr Fox observed, that it was undoubtedly a doctrine was held that no person was entitled to it, till he had recognised by the law of nations, that free bottoms did not make free goods; but he doubted much the propriety of discussing it at this critical juncture. He thought our claims upon this subject were extended too far when they were made to reach to naval stores, as these had not been at former periods considered as contraband. He then adverted to the successes of the war, which had been enumerated by Mr Dundas. On the navy he bestowed merited praise, and also on the late first lord of the admiralty, assigning his merit as the reason for the constant

of thereafter having a right to arrest neutral vessels at-

1801.

Reign of and brilliant triumphs of the navy; whilst our military was now stated as only amounting to about L.6,000,000. Reign of George III. expeditions, though our troops were as brave as our sea- As some deficiencies of former estimates required to be George III. France; and how had we succeeded? Which of the two nations had been most aggrandised in the course of it? A country paying double its land-rent was in a state demanding inquiry. The war secretary had talked much about the diversion of war, and shown us its nature on his principles. He had sent the Duke of York and an army of thirty thousand men to the only neck of land perhaps in the world where a fifth part of their own numbers was equal to cope with them. Of the armistice of Hohenlinden, and the negociation which followed it, Mr Fox spoke with indignation, reprobating the conduct of the minister, which had so fatally proved that eloquence was distinct from wisdom. Time had now evinced that all the great objects of the war were defeated, and that our allies had deserted us; and when no prospect of success remained, we might resort to negociation. The same men who had rejected the proposals of Bonaparte with insolence, must approach with respect, suing for favour, to avoid participating in the disgrace. With regard to the Irish Catholics, no man ought to be deprived of his rights because he worshipped God according to the dictates of his own conscience; and it was a reflection upon parliament to say, as Mr Pitt had said, that he could not there propose a measure which he approved. He declared his belief that no such difficulty existed, but that the late minister might wish to retire for a season, till overtures of peace were made, which he could not make, without mortification, to the man whom he had insulted. He spoke of the change of administration as a fortunate occurrence. Some indeed might suspect, from the panegyric of Mr Pitt, that the new ministers were the less gaudy puppets, directed by those who had quitted their stations; and if they adopted the system of their predecessors, with the additional blame of being hostile to the Catholic claims, acting in this point from their own motives, they would be unworthy of con-

The new chancellor of the exchequer, Mr Addington, observed, that the degree of confidence which the House of Commons ought to extend to the present ministers, it persons duly appointed by his majesty, unless it was precluded by antecedent character and conduct. He then commented on all the leading points in dispute with the northern powers; and after stating the grounds of the principle asserted by this country, and referring to the exception made by existing treaties, gave it as his opinion that the right for which we contended was vital and fundamental, and could neither be abandoned nor compromised. Lastly, he felt it incumbent on him to declare that it was the determination of his majesty's servants to take such steps as appeared to them best calculated for the restoration of peace; that no form of government in France would obstruct negociation; and that if there was a corresponding disposition on the part of the enemy, the grand object would be accomplished. The motion for inquiry was then rejected by a majority of more than two to one.

Notwithstanding the change of ministry, Mr Pitt brought forward the business of the supplies in the House of Commons. Their amount was L.35,587,462; of which sum L.15,800,000 was for the navy, L.15,902,000 for the army, and L.1,938,000 for the ordnance. The income tax 30th March, and with a fine breeze at north-north-west

men, had generally failed. In naval tactics almost every provided for, Mr Pitt stated, that the whole charge of thing depended on the talents of the officers; whereas, in the two countries, for the service of the year, would military movements, much depended on the original de- amount to L.42,197,000, which would be divided between sign. The boasted capture of islands was not the object the two countries thus: Great Britain for its fifteen sevenof the war: our object had been to protect Europe against teenths of the joint expense, and those charges which belonged separately to her, would have to defray, in round numbers, L.37,870,000; and the charges falling upon Ireland would be L.4,324,000. The sum of L.25,000,000 was raised by way of loan, and new taxes were imposed upon paper, tea, houses, lead, the post-office, and various other articles. The income tax was also further mortgaged, so that the debt for which it was pledged amounted to L.76,000,000.

In the meanwhile, to prevent the active co-operation of Denmark with Russia, and if possible to break up the northern confederacy, an armament was fitted out in the British ports, consisting of eighteen sail of the line, and as many frigates, sloops, bombs, fire-ships, and smaller vessels, as made the whole amount to about fifty-three sail. This fleet, under the command of Admiral Sir Hyde Parker, with Vice-admiral Lord Nelson as his second, sailed from Yarmouth on the 12th of March 1801, and soon afterwards reached its first rendezvous at the entrance of the Cattegat. The Danish navy at this time consisted of twentythree ships of the line, with about thirty-one frigates and smaller vessels, exclusive of guard ships. The Swedes had eighteen ships of the line, fourteen frigates and sloops, seventy-four galleys and smaller vessels, besides gun-boats, all in a state of respectable equipment. The Russians had eighty-two sail of the line and forty frigates, and of these thirty-one sail of the line and a proportional number of frigates were in commission in the Baltic, being divided between Petersburg, Archangel, Cronstadt, and Revel; but their fleet was ill built, ill manned, ill officered, and ill-equipped; and, of the number in commission in the Baltic, probably not more than twenty sail of the line could have been put into a condition to act against an enemy. At this time the Swedes had eleven sail of the line at Carlscrona, ready for sea, and in tolerable fighting trim; the Danish fleet at Copenhagen consisted of ten sail of the line ready for sea, exclusive of about an equal number in an unserviceable state; and, assuming the available Russian force as above stated at twenty sail of the line, it thus appears that the entire effective strength of the was not for him to conjecture; they only asked for that fleets of the northern confederates amounted to forty-one portion of it which should be constitutionally reposed in sail of the line, besides frigates and smaller vessels. But as not more than twenty-five or twenty-six of these could by any means have been assembled at a given point, and as even the best of them were decidedly inferior to our ships in condition, equipment, discipline, and skill, eighteen, or even fifteen British sail of the line were more than a match for them. This explanation is necessary to show that the British government were not guilty of any rashness in sending to the Baltic a force apparently so small in comparison of that to which it was opposed; though they certainly deserve the strongest reprobation for allowing any petty consideration to prevent them from appointing Nelson to the command.

It was at first hoped that Denmark, notwithstanding her hostile demonstrations, would prefer negociation to war; but this expectation having been disappointed, and the Danish government, instead of conciliation, having assumed a tone of open defiance, preparations were made for forcing the passage of the Sound, though in these much valuable time was lost through the irresolution of the admiral, Sir Hyde Parker. At length, however, the British fleet weighed anchor at six o'clock in the morning of the

Reign of entered the Sound in a line a-head, the van division com-George III. manded by Lord Nelson in the Elephant, the centre division by the commander-in-chief, and the rear division by Rear-admiral Graves. At seven the batteries at Elsineur, which had been represented as tremendous, commenced firing at the Monarch, which was the leading ship, and the other ships as they passed in succession; but the distance was so great that not a shot took effect, nor did any of the British ships fire in return except the van division, which only discharged a few broadsides. As the strait at Elsineur, however, is less than three miles across, a mid-channel passage would undoubtedly have exposed the ships to a fire from Cronenburg Castle, adjoining Elsineur, on the one side, and from the Swedish town of Helsinburg on the other; but the British having observed that the batteries of the latter mounted only eight guns of a small calibre, inclined to the Swedish shore, where not even a show of opposition was made, and passing within less than a mile of it, avoided a fire which, as proceeding from nearly a hundred pieces of cannon, could scarcely have failed to do much injury to the ships. About noon the fleet anchored at some distance above the island of Huen, which is about fifteen miles from Copenhagen; and the commander-in-chief, Vice-admiral Lord Nelson, and Rear-admiral Graves, accompanied by Captain Domett and the commanding officers of the artillery and troops (namely, the forty-ninth regiment, two companies of the rifle corps, and a detachment of artillery which had been embarked on board a division of the fleet in the Downs), proceeded in a lugger to reconnoitre the enemy's defences. These were soon ascertained to be of the most formidable description. It was apparent that the Danes could not be attacked without great difficulty and risk; and when a council of war was called in the afternoon, much as usual was urged to show the propriety of foregoing, or at least delaying, the attack. Councils of war never fight. But happily the opinion of Nelson prevailed, and he offered his services for the attack, requiring ten sail of the line and all the small craft. Sir Hyde Parker willingly accepted the tender, gave him two more line-of-battle ships than he asked, and wisely left every thing to his own judgment.

The force at Copenhagen was not the only obstacle to be contended with. The approach to it was by a channel extremely intricate and little known; and, to increase the difficulty of navigating it, the Danes had removed or misplaced the buoys. But Nelson himself saw the soundings made, and buoys laid in the outer channel, between the island of Saltholm and the Middle Ground, boating it upon this exhausting service until it was completed. An attack from the eastward was first meditated; but a second examination of the Danish position, on the 31st, and a favourable change of the wind, determined the vice-admiral to attack from the south. Accordingly, on the morning of the first of April, the British fleet removed to an anchorage within two leagues of the town, off the northwestern extremity of the Middle Ground; a shoal extending along the whole sea front of the city of Copenhagen, and leaving an intervening channel of deep water called Konigstiefe, or King's Channel, about three quarters of a mile wide. In the course of the forenoon Nelson, accompanied by Captain Riou of the Amazon, reconnoitred for the last time the position which he was about to attack; and soon after his return at one o'clock the signal to weigh appeared at the Elephant's mast-head. It was received with a shout throughout the whole squadron, and promptly obeyed. They weighed with a light and favourable wind; the small craft pointed out the course distinctly; Riou led the way in the Amazon; and coasting along the edge of the right hand shoal or Middle Ground until they reached and partly rounded its southern extremity, the

squadron anchored off Draco Point just as the darkness Reign of closed, the headmost of the enemy's line not being more George IIL than two miles distant. Captain Hardy now proceeded in a small boat, under cover of the night, to examine the channel between the anchorage and the Danish line, and actually approached near enough to sound round the first ship of the latter, using a pole lest the noise of throwing the lead should occasion a discovery. Having completed his task, he returned about eleven o'clock, and reported to the admiral the depth of the water, and the practicability of the channel up to the Danish line. This was gratifying news to Nelson, though it added to his impatience, and prevented him from sleeping during the remainder of the night, the whole of which was spent in preparing instruc-

tions and receiving reports.

The force now about to be attacked was of the most formidable description. It consisted of eighteen vessels, all two-decked ships, but some of themold and dismantled, with frigates, praams, and radeaux, mounting altogether about six hundred and fifty guns, and moored in a line of about a mile in extent, flanked at the north end, or that nearest the town, by two artificial islands called the Trekröner or Crown Batteries, one of thirty twenty-four pounders, and the other of thirty-eight thirty-six pounders, with furnaces for heating shot, and commanded by two-decked blockships. The entrance into the harbour and docks, which are situated in the heart of the city, was protected by a chain drawn across it, and also by some batteries on the northern shore, particularly the Trekröner already described; and, in addition to this, two seventy-four gun ships, Dannemarck and Trekröner, a forty-gun frigate, two eighteen gun brigs, and several armed zebecs, provided with furnaces for heating shot, were moored in advantageous positions off the mouth of the harbour. Along the shore of Amak island, a little to the southward of the floating line of defence, were gun and mortar batteries; and as the Danes were animated by an enthusiastic spirit of patriotism, and eager by every possible means to repel the assailants, there was no want of men, skilful and brave, to work the guns, either afloat or on shore.

The day of the second of April broke, as Nelson had hoped it would, with a favourable, south-easterly wind; and the signal for all the captains to come on board the flag-ship was hoisted as soon as it could be seen. As circumstances prevented the admiral's plan of attack being strictly followed, it may suffice to state that all the lineof-battle ships were to anchor by the stern abreast of the different vessels composing the enemy's line, an operation for which they were already prepared by having cables out of their stern-ports. The Amazon, Blanche, Alcmène, Arrow, and Dart, with two fire-ships, all under the direction of Captain Riou, were to co-operate in the attack on the ships stationed at the mouth of the harbour, and to act otherwise as circumstances might require. The bombvessels were to station themselves outside the British line, and to throw their shells over it; while the Jamaica, with the brigs and gun-vessels, was to take a position for raking the southern extremity of the Danish line; and a similar station was assigned to the Desirée. It was also intended that the forty-ninth regiment, under Colonel Stewart, and five hundred seamen under Captain Freemantle of the Ganges, should storm the principal of the Trekröner batteries, the instant that its fire should be silenced by the cannonade from the ships. Between eight. and nine o'clock the pilots, most of whom had been mates in Baltic traders, were ordered on board the Elephant. But as they hesitated about the bearing of the east and of the shoal, and the exact line of deep water, it became evident that their knowledge was not to be trusted. Nelson was extremely perplexed. The signal for action had been

Reign of made; the wind was fair; not a moment was to be lost. know the unfavourable accidents which had deprived Nel- Reign of cide; but they wanted the only ground for steadiness and resolution in such a case; and Nelson had now reason to regret that he had not trusted to Captain Hardy's single report. At length Mr Alexander Briarly, the master of the Bellona, undertook to lead the fleet; and his proposal being acceded to, the captains returned to their ships, and at halfpast nine the signal was made for the ships to weigh in succession, and advance to the attack.

next in order, having anchored rather outside than off the great shoal, could not weather it, and was obliged to bring up again in six fathoms water, where the current was so strong that, although she afterwards re-weighed, and continued for a long time to warp with the stream and kedge anchors, she was compelled again to bring up nearly in the spot from which she had last weighed. When the misfortune of the Agamemnon was discovered, the admiral and the Isis steered after the Polyphemus. The Bellona, notwithstanding a fair wind and ample room, kept too close on the starboard shoal, and grounded abreast of the outer ship of the enemy. The Russell following the Bellona, also grounded; and although both were within range of shot, their absence from their intended stations was severely felt. Three ships of the squadron were now aground and comparatively useless; so that Nelson was compelled to begin the attack with one ship of the line less than he had calculated upon as absolutely necessary. In compliance with the wish of the pilots, each ship had been ordered to pass her leader on the starboard side, from a supposition that the water shoaled on the larboard; but, as Captain Hardy had proved, the water deepened all the way to the enemy's line. The Elephant, flag-ship, came next; but Lord Nelson, as soon as he perceived the state of the Bellona and Russell, ordered his helm to be put a starboard, and passed within those ships; and all the ships astern followed his example. By this act of promptitude on the part of the admiral, the greater part of the fleet were saved from going on shore. At the moment when Lord Nelson's squadron weighed, Admiral Parker's eight ships did the same, and took up a position somewhat nearer the mouth of the harbour, so as to menace the northern wing of the defence; but a nearer approach was impracticable in time to render any active service in the engagement.

The cannonade commenced at five minutes after ten, and for nearly an hour the principal ships engaged were the Polyphemus, Isis, Edgar, Ardent, and Monarch. By half-past eleven, however, the Glatton, Elephant, Ganges, and Defiance, got to their respective stations, as did also several frigates and smaller vessels, and the action now became general. The Desirée proved of great service in raking the Provesteen, and drawing part of her fire from the Polyphemus and Isis; but owing to the strength of the current, the Jamaica, with the gun-vessels, could not get near enough to be of any service in the action; and the bomb-vessels were not able to execute much. The absence of the Agamemnon, Bellona, and Russell, disconcerted the plan of the attack, and caused several of the British ships to sustain a heavier share of the enemy's fire than had been allotted to them, or they were well able to bear; and among the sufferers on this account was the Amazon frigate, which, along with four others under Captain Riou, had boldly taken a position right against the Trekröner batteries. The cannonade had continued three hours, and few if any of the Danish block-ships, praams, or radeaux, had ceased firing, nor had the contest as yet taken a decisive turn to either side. Meanwhile the commander-in-chief, near enough to the scene of conflict to

George III They were urged to be steady, to be resolute, and to de- son of one fourth of his force, and yet too distant to know George III. the real state of the contending parties, suffered the most

dreadful anxiety: and from the reports made to him that signals of distress were flying at the mast-heads of two British line-of-battle ships, and the signal of inability on board a third; from observing the zig-zag course and slow progress of the Defence, Ramillies, and Veteran, which he had dispatched as a reinforcement; and from the distance of the London, which bore his flag, preventing his judging The Edgar led the way; but the Agamemnon, which was of the relative condition of the contending parties; Sir Hyde Parker was induced to throw out the signal for discontinuing the action. When this was reported to Nelson, he continued to walk the deck without appearing to take any notice of it. At the next turn the signal lieutenant met him, and having stated that the commanderin-chief had thrown out number thirty-nine, asked if he should repeat it. "No," replied Nelson, "acknowledge it;" and presently he called after the officer to know if the made signal for the Polyphemus, which followed the Edgar; signal for close action was still flying. Being answered in the affirmative, he said, "Mind you keep it so;" and, after pacing the deck for some time, moving the stump of his lost arm in a manner which always indicated great emotion, he accosted one of the officers thus: "Do you know," said he, "what is shown on board the commander-in-chief? Number thirty-nine." The officer asked what that meant. "Why, to leave off action." Then, shrugging up his shoulders, he exclaimed, "Leave off action! No, damn me if I do. You know, Foley," turning to the captain, "I have but one eye; I have a right to be blind sometimes:" and then putting the glass to his blind eye, in sportive bitterness, he exclaimed, " I really do not see the signal;" adding, after a momentary pause, "Damn the signal! Keep mine for closer battle flying. That's the way I answer such signals. Nail mine to the mast!" The three frigates and two sloops nearest to the London, however, obeyed the signal, and hauled off from the Trekröner batteries; when " the gallant, good Riou" was killed by a raking shot, which cut him in two, just as the Amazon presented her stern to one of the latter.

About half past one the fire of the Danes began to slacken, and at a little before two it had ceased along nearly the whole of their line. Some of the praams and light vessels had also gone adrift; but few if any of the vessels whose flags had been struck would suffer themselves to be taken possession of, and fired on the boats as they approached; whilst the batteries on the isle of Amak aided them in this irregular warfare. Nelson was justly irritated at this conduct on the part of the Danes; and at one time had thoughts of sending in the fire-ships to burn the vessels which had surrendered. But, as a preliminary measure, he retired into the stern gallery, and wrote to the crown prince of Denmark that celebrated letter, which will ever be memorable in the history of England: "Vice-admiral Lord Nelson is commanded to spare Denmark when she no longer resists. The line of defence which covered her shores has struck to the British flag; but if the firing is continued on the part of Denmark, he must set on fire all the prizes that he has taken, without having the power of saving the men who have so nobly defended them. The brave Danes are the brothers, and should never be the enemies, of the English." This letter was carried on shore with a flag of truce by Sir Frederick Thesiger, who found the crown prince at a sally-port. Meanwhile a destructive cannonade was still kept up by the Defiance, Monarch, and Ganges, while the near approach of the Defence and Ramillies silenced the fire of the Indosforethen, Holstein, and the ships next to them in the Danish line. But the great Trekröner still continued its fire. This formidable work, having had nothing but frigates and sloops

George III. uninjured; and as it had just been manned with nearly fifteen hundred men, it was considered as too strong to be successfully stormed. It was now judged advisable to withdraw the fleet out of the intricate channel while the islands of Amak and Saltholm, and steered for the northwind was fair; and preparations were making for this purpose, when the Danish adjutant-general Lindholm came, bearing a flag of truce; upon which the Trekröner discontinued its fire, and the action, after having lasted five hours, during four of which it had been hotly contested, was brought to a close.

purport of Lord Nelson's note, the latter replied in writing, that humanity was the object; that he consented to stay hostilities in order that the wounded Danes might be have been for one moment intrusted to another. On the taken on shore; that he would take his prisoners out of the vessels, and burn or carry off his prizes, as he should think fit; and that he would consider this as the greatest victory he had ever gained, if it should lead to a reconciliation between the two countries. Sir Frederick Thesiger was dispatched a second time with the reply; and the Danish adjutant-general was referred to the commander-in-chief for a final adjustment of terms. Lindholm, accordingly, proceeded to the London, about four mark and Sweden had quailed; but events had already miles off; and Nelson, availing himself of the opportunity thus afforded, made signal to the leading British ships, all of which were much crippled in their rigging and sails, to weigh in succession. The Monarch led the way, and touchships, drove her clear. The Glatton, drawing less water, passed free; but the Defiance and Elephant grounded ed for many hours, in spite of the exertions of their crews. At the opposite end of the line, also, the Desirée, having gone to assist the Bellona, became fast on the same shoal. Soon after the Elephant grounded, Lord Nelson quitted her and followed Lindholm to the London. The boats of treaty of armed neutrality which she had entered into with Sweden and Russia.

This was a murderous action. Our loss in killed and wounded fell little short of twelve hundred; whilst that of the Danes, including prisoners, amounted to about six thousand. Many of the British ships had suffered severely, from the steady hull-firing of the enemy; whilst, as the heavy carronades of the Glatton and Ardent would have produced their full effect, the destruction would have

Reign of opposed to it, and that only for a time, was comparatively themselves, and important to the maritime interests of Reign of England. George II 1801.

On the 12th the British fleet sailed from Copenhagen roads by the difficult channel of the Grounds, between the ern extremity of the island of Bornholm, in order to intercept a Swedish squadron, reported at nine sail of the line. The Swedish admiral, however, whose force consisted of only six sail of the line, sought refuge behind the forts of Carlscrona; and here a negociation was opened, which, on the 22d, ended in an agreement by his Swedish majesty The message from the crown prince being to inquire the to treat for the accommodation of all existing differences. On the 5th of May Sir Hyde Parker was recalled, and Nelson invested with the command, which ought never to 8th he informed the Swedish admiral, by a flag of truce, that although Sir Hyde Parker had consented not to interrupt Swedish navigation, he, Lord Nelson, would act against the Swedish fleet if he found it at sea; and he left Captain Murray with six sail of the line, the Glatton, and a frigate, to cruise off Carlscrona. On the 14th his lordship anchored off Revel roads, prepared, if necessary, to let Russia feel " the Nelson touch," under which Denoccurred in that country which changed the aspect of affairs, and brought on an accommodation without any further hostilities.

On the 23d of March the emperor Paul, who had pered the edge of the shoal; but the Ganges taking her amid- formed so versatile and extraordinary a part on the political stage, from the period when he ascended the Russian throne, expired suddenly. His capricious tyranny, which was at about a mile from the Trekröner, and there remained fix- last about to be directed against the members of his own family, proved fatal to him, and he fell the victim of one of those conspiracies to which despots are peculiarly exposed. His son and successor, Alexander, immediately disclaimed all hostility against Great Britain, and made reparation for the damage which our merchants had suffer-Sir Hyde Parker's division were actively employed during ed from the embargo laid upon their ships. A convention the whole night of the 2d in bringing out the prizes, and was adjusted with Russia in the month of June, which put in getting affoat the ships which were aground; and, by an end to the dispute with the northern states, as Sweden the morning of the 3d, the latter, except the Desirée, were and Denmark could not of themselves hope to resist the got off. The negociations continued during the five fol-lowing days; and, in the interval, all the prizes, except the agreement it was stipulated, that effects embarked in neu-Holstein, a sixty gun ship, which was sent home, were set tral vessels should be free, with the exception of contrafire to and destroyed. Six line-of-battle ships and eight band stores of war, and the property of an enemy; that praams had been taken. Of the former, the Zealand, a the latter designation should not include merchandise of much finer ship than the Holstein, was included amongst the produce, growth, or manufacture of the countries at those consigned to the flames, for what reason we have not war, acquired by the subjects of the neutral state, and been able to ascertain. On the 9th an armistice for four- transported on their account; that the commodities proteen weeks was, after much discussion, agreed to; and hibited should be such only as were declared contraband Denmark engaged to suspend all proceedings under the by the treaty of commerce concluded between Great Britain and Russia in 1797; that a port should be considered as under blockade when the ships of a belligerent power should be so stationed as to render it evidently dangerous to enter; that neutral vessels should not be stopped, except upon strong grounds; that the proceeding should be uniform, prompt, and legal; and that the right of searching mercantile ships sailing under convoy of a ship to the Danish ships or floating hulks, the greater part of of war should only be exercised by the ships of the gothem were literally knocked to pieces; and had the pilots vernment, not by those of private adventurers. By this permitted the British ships to take a closer position, where arrangement the chief points in dispute were settled in favour of this country.

The war between France and Great Britain was now been still more complete, and certainly more rapid. For reduced to merely maritime operations, and these were of the battle of Copenhagen Nelson received the title of Vis- no great magnitude. One of the most important occurred count; a paltry reward for services equally splendid in upon the coast of Spain, between Sir James Saumarez

I James's Naval History of Great Britain, vol. ii. p. 518, et seqq. London, 1822; Southey's Life of Nelson, vol. ii. p. 100, et seqq. London, 1813.

vantage of a leading wind, he conceived that he had every prospect of success. He had previously directed Captain Hood in the Venerable to lead the squadron; but the wind failing, this officer found it impossible to occupy the station assigned to him. Captain Stirling in the Pompée, however, having anchored opposite the inner ships of the enemy, commenced the action; while, in the ardour to engage, the Hannibal unfortunately ran aground. Every effort was now made by the admiral to cover this ship from from one of the batteries on shore, he was obliged to retire, and to leave her in their hands. The loss on board the English squadron was considerable. The admiral had scarcely reached harbour when he was apprised that the French line-of-battle ships, disabled in the action of the Spanish ships of the line under the command of Don Juan de Mozen, and a French ship of seventy-four guns; and that they were all under sail on the morning of the 12th of July, together with their prize the Hannibal. He had almost despaired of having a sufficient force in readiness to oppose such numbers; but by great exertion he was able to warp out of the Mole with all the ships under his command, the Pompée excepted, which had not time to get in her masts. The object of the British admiral being to intercept this powerful force on its way to Cadiz, he observed, late in the evening, that the enemy's ships had cleared Cabrita Point, and at eight he bore up after them. About eleven the Superb came up with the hostile squadron, and opened her fire at not more than three cables' length. At this critical period a mistake of the enemy decided the fate of the action. In the darkness and confusion, the Spanish ships fired upon each other; the Real Carlos took fire and blew up; whilst the Hermenegildo, mistaking her for an enemy, ran on board of her, and shared her melancholy fate; and the San Antonio, of seventy-four guns and seven hundred and thirty men, being thus left unsupported, struck to the Superb. The remaining ships of the enemy now crowded all sail and stood out of the straits; and at daybreak there appeared in sight only one French ship, which was standing towards the shoals of Cavil. But at this juncture the wind failing her, the Venerable was able to bring her to action, and had nearly silenced her when the loss of the mainmast obliged the captain of the Venerable to desist; and this ship, which was one of eighty-four guns, escaped along with

As the French had now resumed their usual menacing project of invasion, and appeared to be collecting a force in the harbour of Boulogne, an attempt was made by Lord Nelson to obstruct their preparations; and he succeeded in doing some damage, which appears to have encouraged him to make a more serious effort. Boats intended for boarding the French vessels were sent off in the night in four divisions, under the conduct of the Captains Somerville, Parker, Cotgrave, and Jones; and launches furnished with howitzers were detached under Captain Conn to join in the enterprise. Parker's division first approached the enemy, and commenced a furious attack, making strenuous efforts, with the most undaunted courage, and sanguine hopes of success. But an unforeseen obstacle baffled all their exertions. This was a very strong netting traced up to the lower yards of the French vessels, which were also

Reign of and a squadron of French and Spanish ships of war. On opening Ca- of cannon and musketry, which killed a number of the asbrita Point he found that the ships lay at a considerable sailants, while many more were wounded and maimed. The distance from the batteries on shore, and having the ad- captain received a shot which carried off his leg and part of his thigh, and his boat would have been seized by the enemy, had not a cutter seasonably towed her off. In the mean time Somerville silenced the fire of a brig near the pier head; but so far from being able to bring her off, he found difficulty in securing the retreat of his own boats. Cotgrave, after a spirited attack, was deprived of the services of many of his men by a fire from the flotilla and the shore. And Jones felt so strongly the obstruction of the tide, that not being able to approach before the break the enemy's fire; but as she was only three cables length of day, when the other captains were returning, he retired without making any hostile attempt. Captain Parker died of his wounds after the return of the fleet to the Downs. The number of British seamen killed and wounded on this occasion amounted to nearly two hundred.

Owing to the refusal of the former administration to ra-6th, were on the 8th reinforced by a squadron of five tify the capitulation of El Arish, negociated between General Kleber and Sir Sidney Smith, the French still retained possession of Egypt. To remedy this unpardonable blunder a considerable force had been dispatched from Great Britain, under the conduct of an experienced and gallant officer, Sir Ralph Abercromby. The British forces under Lord Keith and General Abercromby, after unexpected delays on the coast of Asia Minor, arrived off Alexandria on the 1st of March; and the following day the fleet made sail for the bay of Aboukir, where it anchored. The sea continued to run high until the 8th, and no disembarkation could be effected; but on that day the first division made good their landing at ten o'clock in the morning, in the face of a body of French, who, evidently aware of their intention, were posted in force, with considerable advantage, on some sand hills opposite the landing place. The front of the disembarkation was narrow, and a hill which commanded the whole appeared almost inaccessible; yet the British troops ascended it under a fire of grape and musketry with the utmost intrepidity, and forced the French to retire, leaving behind them seven pieces of artillery, and a number of horses. The disembarkation was continued during that and the following day; while the troops which landed on the 8th advanced three miles the same day. On the 12th the whole army moved forward, and came in sight of the French, who were formed advantageously on a ridge, with their left resting on the canal of Alexandria and their right towards the sea. As it was determined to commence the attack on the 13th, the British force marched in two lines by the left, with an intention of turning the right flank of the enemy. But the attack was in some measure anticipated by the French, who descended from the heights on which they were formed, and assailed the leading brigades of both lines. The British troops were therefore compelled to change their front, which, though one of the most difficult operations in war, was executed with the greatest precision; and the rest of the army immediately followed their example. After a severe conflict, victory declared in favour of the English, though not without considerable loss.

The French commander-in-chief, Abdallah Menou, appears to have acted upon this occasion with but little judgment. Instead of bringing down nearly his whole force to the coast, which would have enabled him greatly to outnumber, and consequently, in all probability, to defeat the invaders, who were less acquainted with the country than his own officers, he thought fit to hazard an engagement on the 21st of March with only half his force. The battle commenced before day light in the morning, by

the right of the English army, which they endeavoured by every possible means to turn. The attack on this point was begun with great impetuosity by the French infantry, sustained by a strong body of cavalry, who charged French were twice repulsed, and their cavalry were reinfantry, who were also repulsed and obliged to retreat. A corps of light troops, however, advanced, supported by infantry and cavalry, to keep in check the left of the English, which was the weakest of the line; but all their efforts were fruitless, and the British remained masters of the field. The loss on our side was great, amounting in killed, wounded, and missing, to upwards of fifteen hungenerals, Roiz, was killed, and Generals Lanusse and Bodet died of their wounds. A French regiment which had been styled Invincible was destroyed in this battle, and its colours fell into the hands of a serjeant of the 42d regiment, called Sinclair, having, it is said, been picked up on the field by a Maltese, named Anthony Lutz. The victory of the 21st decided the fate of Egypt. In this battle, however, the British army suffered a great calamity in the loss of its general. This officer was at once beloved and esteemed by the soldiers whom he commanded; he preserved the strictest military discipline, while at the same time he secured the attachment of his troops by his obvious anxiety for their welfare. Early in the revolutionary war he had been employed on the Continent. He commanded the advanced guard in the action on the heights of Cateau, and he conducted the march of the guards from in 1794. In the following years, till 1797, he command-British in the West Indies; and on his return to Europe he was invested with the rank of lieutenant-general, and appointed to the command of the forces in Ireland. In this station he made great efforts at once to protect the people and restore discipline to the army, both of which the violence of faction had induced the rumanners, yet he possessed great independence of character, and did not hesitate to express, in public orders, the indignation which he felt on observing the disorder and consequent misery which had been introduced into Ireland, by encouraging the licentious insolence of the troops towards persons accounted disaffected to the government: freely informing the army in that country that they were become formidable to every one but the enemy. In the expedition to Holland he displayed military talents which excited the admiration not only of his own army, but of the generals who were opposed to him.

After the death of Sir Ralph Abercromby, the command devolved upon General Hutchinson, who lost no time in proceeding towards Alexandria, where the principal force of the enemy was now concentered. In the mean time the town and castle of Rosetta were taken by a division of the British army under Colonel Spencer, aided by a body of Turks. The French garrison, amounting to eight hundred men, made but a feeble resistance, and retired to the right bank of the Nile, leaving a few men killed and prisoners. While such was the state of affairs in the neighbourhood of Alexandria, Admiral Blan-

But the rated from the rest of his squadron in the dangerous and George III. most vigorous efforts of the enemy were directed against difficult passage of the Red Sea; but before the end of April he was joined by a large reinforcement under the command of General Baird, who had with him Colonels Wellesley and Murray, and other officers of distinction.

As the capture of Grand Cairo, next to that of Alexin column. The contest was unusually obstinate. The andria, was a great object with the allies, a force was detached early in May for its reduction. On the 9th Genepeatedly intermixed with the English infantry. While ral Hutchinson, with four thousand British and an equal this was passing on the right, the French attempted to number of Turks, attacked the French near Rhamanieli; and penetrate the centre of the British army with a column of the latter being driven in, retreated in the night towards Cairo, leaving a small garrison at Rhamanieh, which on the following day surrendered to the British. of the English on this occasion did not exceed thirty men. About the same time a body of French and Copts, who had moved forward from Cairo to attack the Turks, were defeated by the grand vizier, who was essentially assisted by Colonel Murray and other British officers. The French dred. The loss of the French was calculated in the are said to have lost fifty men, and the Turks about thirty English accounts at three thousand. One of the French in this action. The whole number of French engaged amounted to nearly five thousand, and the Turkish army to about nine thousand.

From various causes, it was the middle of June before the British army under General Hutchinson reached the vicinity of Cairo, where he found the works very much extended, though the garrison did not exceed five thousand in number. The capitan pasha at the same time invested Gizeh, a suburb of Cairo, on the left bank of the Nile, and the grand vizier took a position within cannon-shot of the city. Thus invested on every side, the garrison, on the 22d, sent a flag of truce to the English general, offering to treat for the evacuation of Cairo upon certain conditions. After a negociation of several days, the surrender was finally agreed upon in a convention of twenty-one articles; the substance of which was, that the French army at Cairo and its dependencies were to be con-Deverter to Oldensaal in the retreat of the British troops veyed in the ships of the allied powers, and at their expense, together with their baggage, arms, ammunition, and ed in chief in most of the successful enterprises of the other effects, to the nearest French ports in the Mediterranean; and of this convention General Menou was to be at liberty to avail himself. The port of Alexandria was all that now remained in possession of the French; it was attacked by sea and land, and at length surrendered by capitulation on the 2d of September.

By the time when intelligence of this event reached lers of that country to neglect. Though a man of simple England, the views of men had been turned to a new state of things. Administration had seriously entered into negociations for peace, which were conducted by Lord Hawkesbury on the part of Great Britain, and M. Otto, who resided in London as agent for the French prisoners of war, and who was now intrusted on the part of the French with this important business. The whole was managed with such secrecy, that not even persons who held official situations, except those immediately concerned, were acquainted with the state of the negociation; and the lord mayor of London was the first person out of the cabinet to whom the result was communicated. Thus no unfair advantage could be taken; and this treaty stands almost singular on our records, since, at a period when the practice of gambling in the public funds was, from the wide extension of public credit, more predominant than at any previous crisis, not a single instance occurred of any sinister practice. By the preliminary articles, which were signed at London on the 1st of October, by M. Otto on the part of the French republic, and Lord Hawkesbury on the part of his Britannic majesty, Great Britain agreed to the restoration of all her conquests, the island of Trinidad and the Dutch possessions of Ceylon excepted. ket, with a considerable force from the East Indies, ef- The Cape of Good Hope was to remain a free port to all

Reign of the contracting parties, who were to enjoy the same ad- northern powers had been adjusted. It stated that the Reign of George III. vantages; the island of Malta was to be evacuated by territories of Rome and of Naples; the republic of the Seven Islands was recognised by France; the fishery at Newfoundland was re-established on its former footing; and, finally, plenipotentiaries were to be named, and to repair to Amiens, in order to proceed with the arrangement of a definitive treaty of peace, in concert with the allies of the contracting parties. During the war, negociations for peace had so repeatedly proved unsuccessful, that a general incredulity prevailed with regard to the possibility of such an event; and accordingly all merchants conducted their speculations upon the supposition that there existed no probability of an immediate termination to the war. The state of the present negociation had been so carefully concealed, that, when the official intelligence of its issue was transmitted throughout the country, it excited everywhere the utmost astonishment, but nevertheless produced, almost instantaneously, the most unbounded expressions of joy among all orders of persons. The zealous adherents of the late administration, indeed, were upon the whole rather dissatisfied; but their voice was overwhelmed in the general acclamations which took place, and far surpassed the expressions of joy which had occurred at the termination of any former war; and, as an abundant harvest was at the same time reaped, the prospect of plenty added greatly to the public joy.

Parliament assembled on the 29th of October. By this time the new administration, from the mildness of their conduct, and their successful negociations for peace, had obtained a powerful hold on the affections of the public. but this kind of gratuitous support could scarcely be expected to be very consistent or uniform. Mr Pitt him-

preliminaries of peace had been ratified between us and George III. the British troops, and restored to the order of St John the French republic; that whilst this arrangement maniof Jerusalem; Egypt was to be restored to the Ottoman fested the justice and moderation of our views, it would Porte; the territory of Portugal was to be maintained in also be found conducive to the interests of the country its integrity; the French troops were to evacuate the and the honour of the British character; and that as the provision for defraying the expenses of maintaining an adequate peace establishment could not be made without large additional supplies, all possible attention would be paid to such economical arrangements as were consistent with the security of his majesty's dominions. The speech concluded with applauding the operations of the last campaign, and particularly the glorious issue of the expedition to Egypt, which, however, has deserved and obtained a more fitting commemoration.

In the House of Lords the motion for the usual address passed unanimously. In the House of Commons, both Mr Fox and Mr Pitt declared that they joined in the general joy which the peace had produced, and gave it their approbation. On the other hand, Mr Windham differed as to there being any just cause for general joy and exultation; and he disapproved of the preliminaries of peace signed with France, as well as of the address, in as far as it implied an approbation of them. It behoved him to give his reasons for dissenting on so material a point. To stand as a solitary mourner in the midst of public rejoicings, to wear a countenance clouded with sadness whilst all others were lighted up with pleasure, certainly appeared ungracious. But were the circumstances of this peace such as justified our exultation upon former occasions? To him they appeared in a quite contrary view; and when he was desired to illuminate, he first endeavoured to learn whether it was to light him to a feast or a sepulchre. It was his firm persuasion, that in signing this peace his friends had put their signatures to the death-warrant of the country. He knew the inconsistency of human affairs, nor was he profane enough to set bounds to the dispensations of providence; but neither could he foresee what changes might be wrought in the disposition of the people of England by intrigues from without or convulsions from within; and upon no rational view could he see his way out of the evils it would entail upon this country. The only thing necessary to enable France to divide with us the empire of the seas was a participation of our commerce, and this she would effectually secure by the present peace; whilst, by the surrender of our conquests, we had thrown out of our hands the only means to prevent it, the extension of our colonial system. The motives which induced ministers to conclude these preliminaries, he knew not; some of them he had heard, but was not convinced, as they appeared wholly insufficient. If they were forced to accept this peace through inability, their conduct was the more excusable; and we had to thank them, not for what they had acquired, but saved to their country. If they could prove that, by ceding foreign colonies, they had preserved objects nearer and dearer to us, as Portsmouth, Plymouth, and Ireland, and the soil of England, from ravage and desolation, they were entitled to gratitude instead of censure, and had established, not a ground of apology, but a claim to thanks. When they first came into office they appeared to have But such a plea he did not recognise; and how far they obtained a promise of support from their predecessors; were actuated by necessity, would be a matter for future discussion.

Mr Addington described the observations of Mr Windself continued to give countenance to the minister; but ham as premature, since the articles of the treaty were some of his friends avowed their dissatisfaction on ac- not before the house; and, without referring to the terms count of the treaty with France. The speech from the of the peace, he affirmed, that all we had given up would throne announced the conclusion of the negociations com- have afforded us no sort of security against the dangers menced during the last session of parliament; and ex- apprehended by Mr Windham, and that the best counterpressed much satisfaction that the differences with the poise to the power of France consisted in the preservation

1801.

Reign of our constitution, in our industry and skill, and in the West Indies we had Martinico, Trinidad, and other islands; Reign of George III. right direction of our resources. Mr Sheridan, notwithstanding the unanimity with which the address was consented to, believed, that if men sincerely delivered their opinions, there never was a period of less real unanimity. The peace had been spoken of as glorious and honourable. It was a peace of which every Englishman might be glad, but no one proud; and it involved a degradation of national dignity such as the war might lead us to expect, though perhaps it was as good as any minister could make in the

circumstances in which we were placed. His majesty having by message communicated the preliminary treaty with the French republic, an address of thanks was moved on the 3d of November, when Earl Spencer expressed his regret at differing in sentiment from the ministers, with some of whom it was his pride to have coincided in principles, and co-operated in conduct. The great object of Britain, in former wars with France, had been the preservation of the balance of power. This was the point which had been considered, from king William's confederacy against Louis XIV. to the present time; and to insure the maintenance of such an equilibrium, it was not only necessary that Britain should not be left by the peace in a worse political situation than in the beginning of the war, but that her strength, possessions, or acquisitions, should continue in proportion as high as those of France. In the present war, the acquisitions of France had been infinitely beyond all former conception; she had, by her arts or her arms, subdued the Netherlands, Holland, the left bank of the Rhine, and a great part of Italy; her power, compared with that of Great Britain, exceeded what she had been allowed to retain at any former treaty of pacification; nor could we be secure, when such immense acquisitions had been left to France, without any thing like an equivalent left to this country. He therefore condemned the conditions of the peace now concluded, as of very great inequality, whether with reference to the relative state of France and the Continent, or to that of France and England. Lord Pelham thought that the terms of peace were the best which could be procured, even in favour of our allies. Portugal was safe, the Roman and Neapolitan territories had been released from the French yoke; the French were expelled from Egypt, by which our Ottoman ally had been saved; and with regard to Malta, its retention would have been more injurious than beneficial to England, as a powerful garrison would have been requisite for its protection. In the East and West Indies we had been triumphant by sea and land; and our possessions had received important additions by the conquests we had made. As to the security of the peace, we had every security which could be expected; and besides, it was the policy and interest of France to prea prosperous state, we ought to have obtained more honourable terms of peace, because we were in a condition to demand them. It was far from his intention to undervalue the acquisitions of France; on the contrary, he thought them much more important than was generally esteemed. She had made the Rhine the boundary of the empire, and extended her territories beyond the ambition of her monarchs, having her frontiers protected by dependent republics and tributary kings. On our side we had triumphs no less brilliant and striking. We had multiplied our colonies, and our navy sailed the seas invincible; we had rescued Egypt, captured Malta, possessed ourselves of France and Spain; the Cape of Good Hope, the key of the East, was ours; in the East Indies we had every thing except Batavia, which we might also have possessed had

upon the continent of South America we had an absolute George III. empire, in extent almost equal to that power to which we restored it. Such were the colonial possessions acquired by the war; and if Europe could not have been restored to her pristine state, these ought to have been retained as a counterpoise to the power of France. He denied the fairness of comparing the present treaty with that proposed at Lisle. We now gave up Surinam, Malta, and At no time during the contest was the spirit

of the country so depressed as at the negociation of Lisle. A variety of causes combined to produce that despondency; the stoppage of the bank, the defection of our allies, and, above all, the mutiny in the fleet. The measure, therefore, was defensible on the score of necessity; but this was not the case at present; yet we had given to the French the only thing they wanted, the means of creating a navy, and of rivalling us in our commerce, while we had obtained nothing in return. The Earl of Moira was of opinion, that though the terms of the treaty were inadequate, they were unavoidable. Lord Nelson observed respecting Malta, that when he was sent down the Mediterranean, this island was in the hands of the French; and on his return from Aboukir, it was his first object to blockade it, because he deemed it an invaluable service to rescue it out of their possession. In any other view it

was of no consequence, being at too great a distance from Toulon to watch the French fleet from that port; and in time of peace it would have required a garrison of seven thousand men, and in war as many more, without being of any real utility to us. The address was carried by a

great majority.

When the same subject was discussed in the House of Commons, Lord Hawkesbury ascribed the origin of the war to the interference of France in the affairs of other nations; but the state of that country was now considerably amended, and it was impossible to look at the present condition of France without being convinced that we had at least effected this change. He then expatiated on the advantages we had gained, and the good faith we had maintained with our allies, releasing them from express stipulations when they were exposed to danger by continuing faithful to their engagements. With respect to Minorca, he did not consider that island as an acquisition worth retaining. Of Malta he spoke with less confidence, as, from its impregnable state, it was certainly of political consequence in the Mediterranean; but it was no source of trade and opulence; and, connected with the prosperity of the Levant, its consequence was considerably diminished. In a word, considering the results of the war, if the term glory were not taken into account, we had at least made an honourable peace; serve it. Lord Grenville thought that, as Britain was in we had been engaged in a tremendous contest, and had come out of it, considering the circumstances, with advantage. Earl Temple considered those who had signed the peace as having signed the ruin of their country. Amongst the ill consequences likely to result from it, he lamented the encouragement given to republican principles; and as to the various ostensible objects of the war, not one of them had been accomplished. Mr Pitt said that it was undoubtedly the duty of government, in negociations, to obtain the best possible terms; but it was difficult to know how far insisting on some lesser points might endanger the whole treaty; and he declared that he would rather close with an enemy on any terms of Minorca, and shut up the Mediterranean from the ships not inconsistent with the honour of his country, than continue a war for any particular possession. He did not pretend to state that this peace fully answered all his wishes; but the government had obtained the best we thought it worth the cost of an expedition; in the conditions they could, and the terms for which we con-

George III the war. Mr Fox declared himself satisfied with the terms of the treaty, and asserted, that no perseverance in the war would have enabled us to make peace upon better conditions. There were persons who lamented the peace as glorious for France; but if it were so, and not inglorious to England, it gave him no concern. The opinions of men depended in a great degree upon their conceptions of the causes of the war; if one of its objects was the restoration of the accursed despotism of France, to him it was another recommendation of the peace, that it had been obtained without the accomplishment of such an object. In the terms and tone of the present treaty he perfectly coincided. He approved the terms, and thought the noble secretary had wisely tempered firmness of conduct with moderation of tone; but further than this he could not go. He would by no means agree respecting the time in which the treaty was made: it came many years too late. He would put it to the house, whether, at the time the opposition was most railed against for advising pacific measures, we could not have made peace on terms equally advantageous with the present. Would not France, on the breaking out of the war, have acceded to any? Would she not then have relinquished Holland, and perhaps abandoned her designs on the Netherlands? But, since that eventful period, could we not have negociated better after the surrender of Valenciennes; and again, at Lisle, when we only failed from the extravagant pretensions of administration? In January 1800, the first consul made a direct overture, and we returned an answer, that the most effectual mode of facilitating peace would be to restore the Bourbons. Did we hint then at the possession of Ceylon or Trinidad? Would not Bonaparte have added these? Yes, and the Cape into the bargain. We then might have had Egypt by the convention of El Arish. The gallant Abercromby, indeed, would not have fallen covered with laurels in the lap of victory, nor would our brave army have acquired immortal honour; but we should have gained Egypt without the loss of blood or treasure. The first consul might not perhaps have relinquished the Netherlands, nor the left bank of the Rhine; but in Italy he had only the Genoese territory, and we had nothing then to resist to the southeastward of the Alps, and our allies were victorious on the frontiers of France. At that time the instability of the government operated with us; but neither its stability nor its instability were of any real consequence. None of the convulsions and changes of the French revolution produced any material difference in her relation with foreign powers. She had at the beginning made peace with Prussia, and sedulously preserved it during the stormy times succeeding its ratification. We were told by the ministers to pause, and we did pause from January 1800 to October 1801, and added seventy-three millions to our national debt since we returned that impertinent answer to the overtures of Bonaparte; and this pause cost five times as much as all the Duke of Marlborough's campaigns.

To negociate the definitive treaty of peace, the Marquis Cornwallis went to Paris towards the close of the year, and thence proceeded to Amiens, where the negociations went on very slowly, and were not concluded till the 27th of March 1802. The chief difficulty occurred with regard to Malta. But it was at last agreed that it should be restored to the knights of the order of St John of Jerusalem, under the protection and sovereignty of the king of Naples; that it should be under the guarantee of France, England, Russia, Spain, Austria, and Prussia; and that if the order should not have sufficient troops to defend the island, the guaranteeing powers should each contribute an equal portion of troops, the officers to be appointed by the grand

Reign of tended would not have justified ministers in protracting master. It was settled that Malta should be a neutral Reign of port, that one half of the garrison should be Maltese, and George III. that there should be no French nor English body of knights, or tongue as it is called. The king of Naples, however, was to be invited to garrison the island with two thousand men for one year from the restitution of the knights; which was to take place in three months after the exchange of the ratifications of the treaty. In other respects the definitive treaty differed little from the preliminaries formerly agreed to.

> During the dependence of the negociation, the first consul, Bonaparte, had taken some steps which indicated little moderation, and showed that it would be difficult to remain upon terms of amity with him, while the desire of extensive dominion which at present governed his councils seemed of too restless a character to allow much hope of tranquillity to the world. Without waiting till a definitive treaty of peace had been concluded, he sent a large army to St Domingo, which obliged Britain to dispatch a powerful fleet to the West Indies in order to watch its motions. On the Continent his measures were not less arbitrary. A considerable portion of Lombardy, with Milan as its capital, which had been erected into what was called the Italian or Cisalpine republic, and contained some millions of people, was now united to France, by the form of nominating Bonaparte to the office of president over it; a measure which at any other period would have involved all Europe in war: but at present no state ventured to interpose, and the British ministers finding no power in Europe disposed to resist this step towards the permanent aggrandisement of France, and being themselves anxious to restore peace, did not interruptithe negociations on this account.

On Thursday the 29th of April Lord Pelham, by his majesty's command, laid before the House of Lords a copy of the definitive treaty of peace between his Britannic majesty and the French republic, and his Catholic majesty and the Batavian republic, signed at Amiens on the 27th of March. Several debates occurred in that house upon the subject; and at length, on the 15th of May, Lord Grenville moved the order of the day for the house to take into consideration the definitive treaty. He remarked, that it might be asked of what use was discussion, now that peace was concluded? Was it to abrogate, could it correct the treaty? To this question he answered, that this unfortunate treaty had been ratified by his majesty, and was therefore irrevocable; to its terms, however injurious, we were bound to accede. By evasion we should but add disgrace to disaster, and with the loss of national honour fill up the measure of national calamity. He wished not to impede the execution of the treaty, but to demonstrate to that house its dangerous tendency; to ascertain the situation in which it left the country; to point out the perils which impended, and the safety which yet remained. His objections to the preliminary treaty he had already stated; but to the definitive treaty there were objections yet more formidable. The two bases of negociation, the status ante bellum, which signified the actual situation of the parties previous to hostilities, and the uti possidetis, which referred to their position during the pacification, had both been applied in the most prejudicial manner to this country. With regard to herself, England had adopted the status ante bellum; with regard to her rival, the uti possidetis. England had ceded her own conquests, and confirmed to France her new acquisitions. France possessed dominion on the Continent; we had, to oppose that dominion, the colonies of France and Spain. It would have been just that France should purchase our colonial by her continental sacrifices. He contrasted the definitive treaty with that of 1763. It had been an invariable principle with Lord Chatham to make the prelimi-

Immediately subsequent to the preliminary treaty, France the incapacity of the British ministry had lost. had sent an armament to the West Indies, and obliged England to destine for the West Indies also a naval force more than double any squadrons which had been sent during the war. The necessity of keeping in the West Indies thirtyfive sail of the line was the first fruit of the peace. It was obvious that the definitive treaty contained concessions more important than the preliminary articles; and it was palpably the object of the French government to exclude the commerce of this country from the continent of Europe. With respect to the situation in which Portugal and the Prince of Orange were left by the treaty, it had been said that it was a pity, and that the articles were read with regret. The proposed indemnity to the Prince of Orange was evidently at the option of France; for the Cape of Good Hope, no effort had been made to insure its independence; and Malta, whose independence had been expressly stipulated, with the provision that it should be guaranteed by one of the powers of Europe competent to its protection, was finally placed under the guarantee of six powers, who never could be brought to agree on the subject of it. Its restoration to the order was nominal and futile. The order of Malta was virtually extinct; it would be subject to the nomination, the influence, and the dominion of France. He then proceeded to take a retrospective view of the situation of this country at the commencement of the negociation. With a colonial territory of an immense extent, we had, in the very conquests achieved by our arms, the means of perpetuating our victories. From the West Indies, the produce of which amounted to two millions annually, a considerable revenue had arisen, which was now lost. By our naval superiority we had controlled the movements of the French fleet; they were now at liberty to steer for the West Indies, and we were the states-general promised not to obstruct the navigation under the necessity of sending fleets to watch them. We of British subjects in the Eastern seas. That article was were in possession of resources adequate to the prosecution of the war, and held in our hands the means of extorting a just and reasonable peace. Instead of improving these advantages, we had resigned to France the preponderance of power on the Continent, established her sway in Italy, and annexed to her important possessions in India. Even our right of sovereignty in India was no longer recognised. It had been suggested that this right 1802, to resume the competition to which they were unwas guaranteed by the silence of the definitive treaty; a equal, in 1786, under the existing tariff. With regard to mode of argument which appeared equally strange and singular. He affirmed that the sovereignty of the Cape was necessary to the safety of our territories in India, and instanced the war with Tippoo Sultan, when a corvette had been sent to the Cape, from which fresh troops were immediately dispatched, who landed, marched, and co-operated at the siege of Seringapatam. By ceding the Cape to Holland, we had ceded it to France. In the West Indies we had restored to France Martinique and Tobago, and facilitated the recovery of St Domingo. France was also mistress of Louisiana, and in reality of Florida, which could not, from its vicinity to Louisiana, remain subject to Spain; and she possessed the key of Mexico, which she might enter at any period. If we turned to the Mediterranean, it would be impossible to send a single ship there without the permission of France. We were stripped of Majorca, Minorca, and even of the island of Elba; we were excluded from Leghorn, and deprived of the means of maintaining a fleet in that sea; the king of Sardinia could no longer open to us his ports. The victory obtained by Lord Nelson at Aboukir was to be attributed to the assistance rendered by the king of Naples; and in return for these services, the British government had stipulated

Reign of nary as much as possible the definitive treaty. Our ne- without stipulating that they should not return to them. Reign of George III. gociators had treated with France during a naval armistice. In short, whatever the valour of the British navy had won, George III.

The Duke of Norfolk expressed his hope, that, now the sword was restored to its scabbard, it would not again be unsheathed for the acquisition of a station in the Mediterranean. Lord Auckland, in reply to Lord Grenville, stated, that it was an error to hold that all treaties between nations were annulled by war, and that, to be reinforced, they must be specially renewed on the return of peace. It was true, that treaties, in the nature of compacts and concessions, the enjoyment of which has been interrupted by the war, were thereby rendered null; but compacts which were not impeded by the course and effect of hostilities, such as the rights of a fishery on the coasts of either of the belligerent powers, the stipulated right of cutting logwood in a particular district, were not affected by war. There were also circumstances which might authorize the dissolution of treaties, without any rupture between the two parties. It had therefore been observed by Vattel and other writers, that treaties cease whenever an essential alteration in either of the contracting parties takes place. Applying this doctrine to Savoy, Switzerland, and other countries, the temporary victims of the French revolution, he admitted that the definitive treaty contained not a single provision, direct or indirect, for the renewal of treaties which had subsisted previous to the war; but it was not true that, by the non-renewal of our treaties with Holland, the vessels of that republic would be exonerated from the ancient practice of striking their flag to British ships of war in the British seas; for that practice had existed independently of the treaty of 1782, or even of the treaty of Breda in 1767, which were only recognitions of a previously admitted claim. The same remark was applicable to the sixth article of the treaty of 1764, by which no new grant, but an acknowledgment of a right, and a notification to merchants that they would not be disturbed in the exercise of that right. With respect to France, the commercial treaty of 1786 had expired, but not till it had reached the natural era of decay; nor would he feel solicitude for its resuscitation, unless our negociator at Amiens should prove that the French manufacturers were able, in our sovereignty in India, it had been confirmed and extended by various treaties, recognised by all the powers of Europe and India who had accepted privileges from us, and finally established by undisturbed possession. On the contrary, Lord Carnarvon represented the treaty as pregnant with danger to the country. It had been hoped, that some articles relative to our allies, and involving our own national honour, would be altered; but the definitive treaty, instead of realizing, had annihilated these hopes; concession was heaped on concession, and disgrace on disgrace. By omitting to renew former treaties, ministers had unadjusted all former adjusted disputes, and, without the customary acknowledgment of our rights, had left us to the honour and justice of France. Lord Ellenborough expressed much surprise that the non-renewal of treaties should have been urged as a serious objection to the definitive treaty. To what purpose was this solemn nonsense to be revived? Were not these treaties replete with articles wholly inapplicable to the present political state of Europe? For himself, he could as well think of the revival of the condition of mankind, in some remote period, as of the ancient treaties, which had become inapplicable and obsolete. Our sovereignty in India rested on the rights of that the French republic should evacuate his dominions, conquest in legitimate war, upon the repeated recognition

Reign of of all the powers of Europe, and on the best of all rights, George III. possession.

1802.

The same subject, after being repeatedly alluded to, was finally discussed in the House of Commons on the 13th of May. Mr Windham attacked the treaty in several of its prominent parts. With regard to Malta, he contended, that it must ultimately fall into the hands of the French. The little order of Malta, which contained in itself the great characteristic and distinctive qualities which the French revolution had subverted, was now destroyed. The German knights had already refused to serve in a body so degraded and debased; the Neapolitan soldiers would form no security for the independence of the island; the state of Malta was a virtual surrender, and our position in the Mediterranean untenable. The Cape of Good Hope was ceded, in full sovereignty, to the Dutch, who were thus at liberty to resign it to France. Our Indian empire was our sheet anchor; and whatever was necessary for its preservation was of the last importance. The disadvantages upon our side he then contrasted with the advantages in favour of France. By the restitution of Cochin China to the Dutch, they had acquired the means of annoying our possessions in the East Indies. In defining the boundaries of France and Portuguese Guiana, ministers had enabled France to obtain her great object, the navigation of the river Amazons; and the Portuguese settlements were left exposed to the foe. He deplored the cession of Louisiana to France, which, considering the almost indefinite extent of Guiana, was a surrender of the two greatest rivers in the world; the Mississippi in the north, the river of Amazons in the south of America. In aggravation of this thoughtless prodigality, ministers had abandoned the whole continent of Europe to France. We already knew the French too well to doubt that they would scruple what means they used to accomplish their ends. Had they not fraudulently obtained the restitution of Porto Ferrajo to the king of Etruria, in order to secure it to themselves? Regardless of stipulations and treaties, they had seized on the island of Elba; and, to bestow a compensation on the king of Etruria, had extorted Piombino from Naples. The French were a new race of Romans; and in ten years they had even acquired more than the Romans were able to achieve in fifty-three. On the map of Europe two nations only stood erect; and of these, the one from distance more than from strength. Austria was indeed still rich in resources, but destitute of foreign aid. There was no single power which could enter the lists with France. In the first conflict it would be crushed by her tremendous mace. He repeated, that we had given away two continents, and that the object of France obviously was the attainment of universal empire. He admitted that the peace must be observed, now that it had been entered into; but concluded with a motion for an address, expressive of disapprobation of it.

Lord Hawkesbury observed, that from some observations of Mr Windham's, it would seem that whenever any continental power, however unconnected with us, became involved with France, it was our duty to volunteer our interference and assistance. That we were deeply interested in the destiny of the Continent, he was willing to admit; but he conceived our interference with its commotions to be optional, neither instigated by necessity nor extorted by honour. At the end of nine years of war, we had found ourselves deserted by our allies; and with the first intination which his majesty's ministers received of the new constitution of the Italian republic, they had heard of its acceptance by the courts of Vienna, Berlin, and Petersburg. Under these circumstances, he submitted, whether it was incumbent on us to continue the war on account of the Italian republic The cession of Louisiana by Spain to France

was another ground of complaint. That province had Reign of originally been a French colony, when the Mississippi was George III. the boundary between it and Great Britain; and it had been ceded by France to Spain, in a private convention, between the preliminaries and the definitive treaty of 1763; a proof that conventions of this nature, if not right, were at least not new. The value of Louisiana was at present only nominal; as a naval station it was allowed to be insignificant; and its vicinity to America was calculated to diminish, rather than augment, the attachment of that country to France. Concerning the non-renewal of certain treaties and conventions, he observed, that the principle on which treaties had usually been renewed appeared not to be understood. The treaty of Westphalia formed a distinct era in the history of Europe; and in order to ascertain the relative situations of the different powers, it had been customary to renew that treaty, together with any particular conventions subsequent to it. But it was to be considered, that formerly all preceding treaties had been renewed by the other powers of Europe, whereas in the present war no European power had done so; and consequently, if we had renewed former treaties, we only should be bound whilst other nations were free. By renewing former treaties, we should have been forced to sanction all the recent encroachments of France; and by sanctioning the treaty of Luneville we should have been accessory to the dismemberment of the Germanic empire. His lordship represented the definitive treaty as coinciding with the preliminary treaty which had previously received the sanction of the house. In regard to the permanence of the peace, he was willing to admit, and to deplore, that, in the present state of the world, any peace must be insecure; but the precarious tenure on which this blessing was to be held formed no reason for rejecting it. He concluded with moving an address to his majesty, to testify the satisfaction of the house on the conclusion of the definitive treaty. Mr Dundas also opposed Mr Windham. In his judgment, however, the Cape and Ceylon formed our two great bulwarks, and he never would have consented to the surrender of the former. The cession of Malta was also to him a subject of equal regret; and to the relinquishment of either of those places he should have refused his assent had he continued in administration. But he would not support the address moved by Mr Windham, because it contained an invective against the peace. Sir William Young contended, that when a standing army was deemed essential to the preservation of peace, it was proper that the people should be informed of the state of affairs which justified such a measure. Lord Castlereagh remarked, that our grand object, from the commencement to the close of the war, had been the establishment of general security; and that the gradual extinction of jacobin principles, and the gradual restoration of order and tranquillity, had been given as sureties for the peace. With regard to the territorial acquisitions of France, they might eventually become of infinite importance; but they were not pregnant with immediate mischief, and could only be the sources of distant danger. Mr Addington desired not that the treaty should be praised; he had never regarded it with sentiments of exultation, nor lavished on it panegyric; he was content that the honour of the country was unsullied by the measure which had been adopted. He acknowledged that the territorial acquisitions of France could not be viewed without regret; but there were events which we could not control, and dispensations in which we must acquiesce; and he should rejoice to see the resources of this country economized by peace. Mr Sheridan treated the subject with some gaiety. He said he supported the peace, because he was convinced that ministers could obtain no better; their predecessors

Reign of had left them to choose between an expensive, bloody, George III. fruitless war, and a hollow, perilous peace. He attacked the new oppositionists, who had been supporters of the former administration, and demanded, for what did we go to war? Why, to prevent French aggrandisement: Have we done that? No. Then we are to rescue Holland: Is that accomplished? No. Brabant is the sine qua non: Is it gained? No. Then come security and indemnity: Are they obtained? No. The late minister told us, that the example of a jacobin government in Europe, founded on the ruins of a holy altar, and the tomb of a martyred monarch, was a spectacle so dreadful and infectious to Christendom, that we could never be safe while it existed, and could do nothing short of our last effort for its destruction. For these fine words, which had at last given way to security and indemnity, we had laid out near two hundred thousand lives, and nearly three hundred millions of money -and had gained Ceylon and Trinidad. But one grand consolation remained. Bonaparte was to be the extirpator of jacobinism; the champion of jacobinism was to become a parricide; the child of sin was to destroy his mother; he had begged pardon of God and man, piously restored bishops with the salaries of curates, and penitently extorted of them a solemn oath to turn spies and informers in his favour. It had been said, that France must have colonies to be afraid of war; that that is the way to make Bonaparte love peace. He has had, to be sure, a rough military education; but if you put him behind the counter a little, he will mend exceedingly. When he was reading the treaty he thought all the names of foreign places, Pondicherry, Chandernagore, Cochin, Martinico, all cessions. No such thing; they are so many traps or holes to catch this silly fellow in, and make a merchant of him. At this moment, nobody in Britain knew who was minister, as the present ministers continued to identify themselves with the former. Of the late minister, he said that none more admired his splendid talents than he did. If ever man was formed to give lustre to his country, he was that man. He had no low, little, mean, petty vices; he had too much good sense, taste, and talents, to set his mind upon ribands, stars, and titles; he was not of a nature to be the tool and creature of any court. But great as were his talents, he had misapplied them in the politics of this country; he had augmented our national debt, and diminished our population. He had done more to abridge our privileges, and to strengthen the crown at the expense of the constitution, than any minister he could mention. He concluded by moving, as an amendment to Lord Hawkesbury's address, that it was the opinion of that house, that the omission of various opportunities of negociating peace with advantage to this country, more especially the rejection of the overtures made by the first consul of France in January 1800, appeared to have led to that state of affairs which rendered peace so necessary as to justify the painful sacrifices which his majesty had been advised to make for the attainment thereof. But the address proposed by Lord Hawkesbury was carried by a very great ma-

operation of finance consisted of the repeal of the tax upa degree of moderation and prudence which greatly conciliated towards them the minds of the public. On all occasions they defended the former ministry against the time they did not appear unwilling to enter into political

liament was prorogued on the 28th of June, and dissolved Reign of on the following day. The elections which immediately George III. succeeded exhibited the singular spectacle of an administration which avoided interfering in the choice of the members of parliament. The members and friends, however, of the old administration, together with their oppo-

nents, were abundantly active.

The effect of the change of ministry had by this time been very sensibly felt over the whole of the island. During the preceding ten years the minds of men had, in a greater or less degree, been kept in a state of constant alarm from the fear of plots and conspiracies against the government, and from the apprehension that a most dangerous disaffected party was at all times ready to burst forth into action, and that the British constitution was only preserved in consequence of the suspension of the habeas corpus act and other legislative restraints, aided by the extreme vigilance of administration, and of their friends, in repressing disaffected persons. Hence society existed under a sort of general apprehension and distrust; and persons originally unfriendly to the war suffered in all departments of business, and in every quarter of the country, no inconsiderable degree of political persecution. All this had now passed away. The new ministers suffered the penal and restraining laws quietly to expire, and the constitution to depend for support upon its own strength and the ancient provisions of the law; they gave themselves no trouble about the general sentiments of the people with regard to speculative subjects, and seemed desirous to conciliate the good will of all orders of the state. The consequence was, that the fears and anxieties which formerly existed about the safety of the constitution passed away like a dream; a universal attachment to the institutions of the country sprung up; and political animosities, being no longer fed by alarms artfully excited by the government, were, as if by a sort of enchantment, appeased and forgotten.

With regard to the effects of peace upon the British and French nations, these promised at first to prove favourable to the general interests of humanity. The French had successfully defended their own independence, and in their turn assailed those by whom it had been menaced, with such a persevering energy as secured to them a portion of respect from the British nation; whilst, on the other hand, the maritime triumphs of Britain had been so splendid, and the valour of her troops in Egypt so distinguished, as to secure to this country a high degree of consideration in the eyes of the French. The people of the two countries accordingly seemed eager to unite in habits of the most amicable intercourse; considerable numbers of Frenchmen came over to Britain and multitudes of persons of all ranks hastened from Britain to visit a country which had of late years excited, in so remarkable a degree, the attention of all the nations of Europe, and had been the scene of such extraordinary transactions. On this reciprocal tendency of the two nations to abandon their animosities, a system of commercial intercourse might have been reared of a nature much more simple and perfect During this session of parliament the most important than that which had been created by Mr Pitt's treaty; and there is no reason to believe that any disposition exon income, which gave great satisfaction. Indeed, in their isted, on the part of the British government, to stand aloof whole conduct administration conducted themselves with from France, or to avoid, for any political reason, the extension of our commerce with that country. Such an intercourse would have proved favourable to France in every possible way. It would have enabled her people to deattacks of the old opposition; and, in return, they were rive considerable assistance from the capital of British supported by a very considerable number of the members merchants, which would have been rapidly and liberally of that administration, including Mr Pitt. At the same advanced towards promoting the culture of their most valuable productions; and even in a political point of view connections with the members of the old opposition. Par- France must have been aggrandised by such a connection.

Reign of What she wanted was a navy to defend her colonies, and quillity of the colony apparently re-established, than he Reign of George III. to enable her to cope with Britain in the event of a future war; and this advantage she could only obtain by means of commerce, more especially with Britain.

But it soon appeared that a man may be qualified to lead armies successfully to battle, to overrun provinces, and to attain the envied title of a conqueror, who at the same time possesses but a moderate portion of magnanimity, self-command, or knowledge of the maxims of sound policy and the best interests of nations. The French government, instead of seizing the opportunity thus afforded of encouraging the people to become commercial and acquire wealth, and seeking to form a maritime power by opening their ports, and holding out to Britain a commercial treaty arranged on liberal principles, shut their harbours more closely than during the most violent period of the war. Vainly fancying that in this way they would enable their own manufacturers to rival those of Britain, they in fact only excluded their wines from the British market; and by thus losing a sure and ready mode of attracting riches to their country, they prevented the acquisition of capital by enterprising individuals, and ruined the very industry which they intended to encourage and promote. They idly thought that they were in this way limiting the trade of Britain, which, having all the rest of the world open to its efforts, could not be injured; and, in truth, by their narrow views and illiberal policy they only injured themselves. By similar miscalculation, or from a restless spirit of ambition, the French government sought aggrandisement by those efforts of violence which are only tolerable in the midst of war, but which in peace justly excite the jealousy and indignation of mankind.

One of the first enterprises of Bonaparte, in consequence of the peace, was an attempt to reduce under his power the island of St Domingo. During the revolution that great and fertile island had suffered the most severe calamities, which had terminated in the emancipation of the negroes; and the latter had formed themselves into a sort of regular government, at the head of which was one of their own race, Toussaint-Louverture, a man of humanity, and possessed of considerable talents. Reports were circulated in Europe that he wished to render St Domingo independent of France; but of this there is no proof, and it is probable that his chief offence consisted in the general estimation and personal consequence to which he had attained, and that the despotic spirit of Bonaparte could brook no appearance of independence or rivalry in any part of the French territory. Nor was it unnatural that, under a military government, force should have been employed in preference to any method of conciliation. At the end of the year 1801 an army of twenty-five thousand men was sent to St Domingo; and as single ships and small squadrons continued to sail during the winter, loaded with troops, it is believed that nearly forty thousand men were employed in what might be called the first division of the expedition. The accounts of their proceedings are very defective; but, from all that has transpired, the conduct of the French appears to have been extremely disgraceful. The negro chiefs having refused unconseveral battles; and disunion, as usual, following disaster, Toussaint was at last induced to enter into negociation. The terms of the treaty were concealed; but, as he was still at the head of a respectable force, it is believed that not only the possession of his personal freedom, but the undisturbed enjoyment of his property, was secured to him, and that his followers were promised a full indemnity. This occurred in the beginning of May 1801. The French general, Le Clerc, brother-in-law of the first consul, no sooner found the negro chief in his power, and the tran- boasted of their superiority as a people over their en-

committed one of the basest acts of treachery that ever George III disgraced a government. The abdicated general was accused of a conspiracy, though it was evident that from the period of his submission to that of his seizure he had not had time to meditate, much less to organize, such a measure; and on the 12th of May Toussaint and his whole family were put on board a frigate, and shipped off for France, where he soon died of a broken heart in a prison. The negroes perceived that they were deceived and betrayed; and as an attempt was made to reduce them again into a state of slavery, after they had enjoyed freedom for several years, no doubt could remain as to the real object for which the expedition had been fitted out. The chiefs who had been prevailed on to desert Toussaint, and whose desertion had led to his surrender, now justly fearing that they were destined to share the miserable fate of their deluded associate, betook themselves to flight;—the whole island revolted ;-pestilence came in aid of these avengers of tyranny and falsehood;—and the miserable instrument of the first consul's cruelty fell himself the victim of the climate. After a series of horrors and atrocities, even darker and deeper than those which blacken the memory of Robespierre, Marat, St Just, and Carrier, and which will for ever remain a disgrace to the French character, the republic had to regret the loss of sixty thousand of her best troops, in a vain attempt to subdue a colony which might, with temper and humanity, have been conciliated and retained.

In Europe the conduct of the French government was scarcely less arbitrary. The whole fortresses of Piedmont were dismantled, and that country was ultimately annexed to France; and the duchy of Parma and Placentia was treated in the same way. Meanwhile the Swiss, whose form of government had been altered in imitation of that of France, wished to restore the ancient constitutions of the cantons, under which their ancestors had prospered during so many ages. But their present leaders, who had risen to power under the protection of France, solicited the interference of Bonaparte in their favour; and he accordingly sent a numerous army against Switzerland, and, notwithstanding the remonstrances of the British court, placed the sovereignty in the hands of his own dependents or adherents. After all their struggles for freedom, the French nation also submitted to a confirmed military despotism. When Bonaparte assumed the appellation of first consul, it was under the declaration that the office, in terms of the constitution then promulgated, was to endure for only ten years. But this constitution was now altered, and the assent of the people being demanded to a new one, by which Bonaparte was to remain consul for life, and even to possess the power of nominating his successor, suffrages in favour of this measure were obtained to the number of between three and four millions. The event was celebrated with the greatest magnificence in Paris; and addresses of congratulation were presented from the different courts of the continent of Europe, and even from the emperor of Germany.

These transactions could scarcely fail to be noticed in ditional submission, they were attacked, and defeated in Britain, and to become the subject of animadversion in the public newspapers. In fact the unprincipled ambition of Bonaparte, and the degraded character and state of the French nation, formed topics of frequent discussion in the public journals, and were criticised with unexampled severity. Even the personal character of the first consul was not spared; and it cannot be denied that he was often libelled in the grossest manner. Bonaparte appears to have early become sensitive and irritated on this head. The English, owing to their political freedom, had long

Reign of slaved neighbours of France; and the first consul, no George III. doubt, dreaded lest the vanity of his subjects should be wounded by continual representations, coming from the free press of England, of the degraded state into which it was alleged they had fallen. A great degree of irritation was thus produced in the French government against England; and the first consul even went so far as not only to prohibit the importation of English newspapers into France, but to demand from our government that the best bulwark of British freedom should be destroyed, by imposing restrictions upon the liberty of the press. He was even weak enough, through the medium of the French official journal, to commence a contest of argument, eloquence, and vituperation, against the writers of English newspapers. But in such a warfare he could not fail to be beaten; because they had nothing else to do but to write; and because the obscurity of their situation as individuals enabled them to inflict deep wounds without fear of reprisals. Newspaper writers also had much to gain by the contest, and certainly could wish for nothing more favourable to their interests, than to be enabled, during a dull, monotonous period of peace, to render their lucubrations interesting, and to amuse their readers by engaging in a paper war with Bonaparte. These circumstances, however, added to the restless ambition of this wonderful person, and his obvious want of discernment as to the true interests of France, or of patience to pursue them, left but little reason to hope that the peace so recently concluded would be of any long duration

The new parliament assembled on the 16th of November, and Mr Abbot was chosen speaker of the House of Commons. On the 22d, his majesty, in a speech from the throne, after congratulating the country on the abundant harvest, remarked, that the state of the manufactures, commerce, and revenues of the united kingdom was flourishing beyond example; that the loyalty and attachment which were manifested to his person and government afforded the strongest indication of the just sense entertained of the numerous blessings enjoyed under the protection of our happy constitution; that, in his intercourse with foreign powers, he had been actuated by a sincere disposition for the maintenance of peace; that nevertheless he could not lose sight of that established and wise system of policy by which the interests of the other states were connected with our own, or be indifferent to any material change in their relative condition and strength; that his conduct would be invariably regulated by a due consideration of the actual situation of Europe, and a watchful solicitude for the permanent welfare of his people; and that he would not fail to adopt those means of security which were best calculated to preserve to his subjects the blessings of peace. In both houses the usual address was agreed to unanimously and without debate.

About this time Colonel Despard, and six persons of low rank, were executed for high treason. Despard was an Irishman, and of good family. Having long been under close confinement during the late administration, on suspicion of entertaining criminal designs against the government, his imagination, while under seclusion from society, had become inflamed nearly to madness; and after his liberation, in consequence of the habeas corpus act being no longer suspended, he had associated with a number of mean persons, whom he had induced to imagine that they were capable of overturning the government and altering the constitution. They accordingly took an oath to this effect, and agreed to attack the king at the meeting of parliament, to seize the Tower and the bank, and to incite a general insurrection. But their wild scheme was discovered, and their criminal engagements being fully proved, they were convicted and executed.

1803.

In the meanwhile some difficulties occurred in the exe- Reign of cution of the treaty of Amiens. The British ministry had George III. avoided engaging in a quarrel with Bonaparte on account of his continental usurpation, because they found no power willing to join them in resisting him; but his restless ambition induced him to endeavour to lay hold of the island of Malta; and his impatient spirit prevented his conducting the plan in such a manner as might have enabled him to avoid suspicion and insure success. That island was destined by the treaty to be intrusted to the order of St John of Jerusalem. Without waiting till the British had abandoned it, Bonaparte instantly set on foot negociations with the different countries to which the knights of the order belonged, to procure the abolition of the order, the confiscation of its revenues, and the prohibition of the future enrolment of knights, and their departure for Malta. And having accomplished these objects, he required the British government to deliver up the island to a grand master, appointed, at his instigation, by the pope; or to the king of Naples, who was to receive possession, in the first instance, for behoof of the knights. Strictly speaking, there was thus no longer any order of Malta to defend the island; and as the king of Naples was at all times at the mercy of France, the evacuation of Malta by the British troops would, in the actual posture of affairs, have been equivalent to the transferring it to the latter power. The British ministry had submitted to the late continental acquisitions of France from want of means to oppose them; but they resolved to oppose the seizure of this island, which may be considered as the key of the Mediterranean, because the superiority of the British fleet enabled them successfully to do so. This determination appears to have greatly perplexed the vehement and irritable mind of the first consul. No successful resistance had hitherto been offered to any of his continental enterprises; and as the attempt now made to refuse delivery of the island to the king of Naples, and the nominal grand master of the order of St John, could only be justified by accusing him of having acted fraudulently against the spirit of the treaty, so an acquiescence on his part in the retention of the island, contrary to the express stipulations of the treaty of Amiens, would have been equivalent to a confession of guilt. In this situation he found himself detected in a deceit which he was unwilling to acknowledge; whilst, at the same time, he suffered the additional mortification of having sacrificed his reputation without any profit in return, the irresistible power of the British navy rendering it impossible for him to seize Malta by force. In this dilemma, a conversation occurred between him and the British ambassador Lord Whitworth, which, as the fortunes of Bonaparte have been so extraordinary, it may be worth while to record, in the terms in which it was reported to the British court. In a letter to Lord Hawkesbury, dated the 21st February, Lord Whitworth says:-

"I received a note from M. Talleyrand, minister for foreign affairs, informing me the first consul desired to converse with me, and that I would come to him at the Thuilleries at nine o'clock. He received me in his cabinet, with tolerable cordiality; and after talking on different subjects for a few minutes, he desired me to sit down, as he himself did on the other side of the table, and began. He told me that he felt it necessary, after what had passed between me and M. de Talleyrand, that he should in the most clear and authentic manner make known his sentiments to me, in order to their being communicated to his majesty; and he conceived this would be more effectually done by himself, than through any medium whatever. He said that it was a matter of infinite disappointment to him, that the treaty of Amiens, instead of being followed by conciliation and friendship, the natural effects

which he pretended to have received from England. He placed in the first line our not evacuating Malta and Alexandria, as we were bound to do by treaty. In this he said that no consideration on earth would make him acquiesce, and of the two, he had rather see us in possession of the Fauxbourg St Antoine, than Malta. He then adverted to the abuse thrown out against him in the English public prints; but this, he said, he did not so much regard, as that which appeared in French papers published in London. This he considered as much more mischievous, since it meant to excite this country against him and his government. He complained of the protection given to Georges, and others of his description, who, instead of being sent to Canada, as had been repeatedly promised, were permitted to remain in England, handsomely pensioned, and were constantly committing all sorts of crimes on the coasts of France, as well as in the interior. In confirmation of this, he told me that two men had within these few days been apprehended in Normandy, and were now on their way to Paris, who were hired assassins, and employed by the Bishop of Arras, by Georges, and by Duthiel, as would be fully proved in a court of justice, and made known to the world. He acknowledged that the irritation he felt against England increased daily, because every wind (I make use as much as I can of his own ideas and expressions) which blew from England brought nothing but enmity and hatred against him. He now went back to Egypt, and told me, that if he had felt the smallest inclination to take possession of it by force, he might have done it a month ago, by sending twenty-five thousand men to Aboukir, who would have possessed themselves of the whole country, in defiance of the four thousand British in Alexandria. That instead of that garrison being a means of protecting Egypt, it was only furnishing him with a pretence for invading it. This he would not do, whatever might be his desire to have it as a colony; because he did net think it worth the risk of a war, in which he perhaps might be considered as the aggressor, and by which he should lose more than he could gain, since, sooner or later, Egypt would belong to France, either by the falling to pieces of the Turkish empire, or by some arrangement with the Porte. As a proof of his desire to maintain peace, he wished to know what he had to gain by going to war with England. A descent was the only means of offence he had, and that he was determined to attempt by putting himself at the head of the expedition. But how could it be supposed, that after having gained the height on which he stood, he would risk his life and reputation in such a hazardous attempt, unless forced to it by necessity, when the chances were that he and the greatest part of his expedition would go to the bottom of the sea. He talked much on this subject, but never affected to diminish the danger. He acknowledged that there were a hundred chances to one against him; but still he was determined to attempt it, if war should be the consequence of the present discussion; and such was the disposition of the troops, that army after army would be found for the enterprise. He then expatiated much on the natural force of the two countries. France with an army of four hundred and eighty thousand men (for to this amount it is, he said, to be immediately completed), all ready for the most desperate enterprises; and England with a fleet that made her mistress of the seas, and which he did not think he should be able to equal in less than

ten years. Two such countries, by a proper understand-

ing, might govern the world, but by their strifes might

Reign of peace, had been productive only of continual and in- overturn it. He said, that if he had not felt the enmity Reign of George III creasing jealousy and mistrust; and that this mistrust was of the British government on every occasion since the George III now avowed in such a manner as must bring the point treaty of Amiens, there would have been nothing that he to an issue. He now enumerated the several provocations would not have done to prove his desire to conciliate; participation in indemnities as well as in influence on the Continent, treaties of commerce, in short, any thing that could have given satisfaction, and have testified his friendship. Nothing had, however, been able to conquer the hatred of the British government, and, therefore, it was now come to the point, whether we should have peace or war. To preserve peace, the treaty of Amiens must be fulfilled; the abuse in the public prints, if not totally suppressed, at least kept within bounds, and confined to the English papers; and the protection so openly given to his bitterest enemies (alluding to Georges, and persons of that description) must be withdrawn. If war, it was necessary only to say so, and to refuse to fulfil the treaty."

The result of this conversation, and of some circumstances in the conduct of the French, was, that on the 8th of March, the following message was addressed by the king to the House of Commons. "His majesty thinks it necessary to acquaint the House of Commons, that as very considerable military preparations are carrying on in the ports of France and Holland, he has judged it expedient to adopt additional measures of precaution for the security of his dominions. Though the preparations to which his majesty refers are avowedly directed to colonial service, yet as discussions of great importance are now subsisting between his majesty and the French government, the result of which must at present be uncertain, his majesty is induced to make this communication to his faithful Commons, in the full persuasion, that while they partake of his majesty's earnest and unvarying solicitude for the continuance of peace, he may rely with perfect confidence on their public spirit and liberality, to enable his majesty to adopt such measures as circumstances may appear to require, for supporting the honour of his crown, and the essential interests of his people." On the motion of Mr Addington, the house voted an address, agreeing unanimously to support the crown in the measures proposed. It speedily appeared that the preparations which had been alluded to in the king's message were extremely trifling indeed. Bonaparte had obliged the Spaniards to cede to him the sovereignty of Louisiana; and an armament, with about four thousand troops, was now preparing to leave the ports of Holland to take possession of the territory thus acquired. The government of the United States opposed this measure; and the state of Kentucky sent notice to the president that ten thousand volunteers had enrolled themselves, and were resolved, with or without the aid of the union, to resist the settlement of the French in their neighbourhood. Meanwhile Bonaparte, who probably had no serious intention of effecting such a settlement, sold for a sum of money to the United States of North America the territory of Louisiana; a country inhabited by many independent tribes of savages, and to which, upon the principles of natural justice, neither he, nor the Spaniards, nor the Americans, had any right. But the inhabitants of Europe, and even the Transatlantic race of Euroropeans, had now for some ages been accustomed to regard all foreign countries as unoccupied property, which they might seize and transfer to each other, without regard to the natural inhabitants, whom they considered as beings of a subordinate race and character. Accordingly this transference of Louisiana excited no surprise in Europe.

Meanwhile, as the king's message to the House of Commons, already mentioned, evinced a determination on the part of the British government to prefer a new war rather than suffer Bonaparte to carry further his ambitious pro-

Reign of jects, the mind of that extraordinary person seems to have worth presented the ultimatum of the British government, Reign of seorge III. been wrought up to an extraordinary degree of irritation. In his palace he affected to use all the forms of the ancient French court. At the drawing-room, where he was waited upon by the whole ambassadors of Europe, and by a numerous assemblage of persons of high rank from all countries, he could scarcely observe the ordinary forms of civility to the British ambassador; and Lord Whitworth, in a dispatch dated the 14th of March, which was afterwards communicated to parliament, gave the following ac-

count of the behaviour of the first consul on one occasion at the court of the Thuilleries :-

"He accosted me evidently under very considerable agitation. He began by asking me if I had any news from England? I told him I had received a letter from Lord Hawkesbury two days ago. He immediately said, 'And so you are determined to go to war.' 'No,' I replied; 'we are too sensible of the advantages of peace. We have had war for fifteen years already.' As he seemed to wait for an answer, I observed only, 'We have had too much of it.' 'But you wish to carry it on for fifteen years longer, and you force me to it.' I told him that it was very far from his majesty's intentions. He then proceeded to Count Marcof and the Chevalier Azara, who were standing together at a little distance from me, and said to them, The English wish for war, but if they are the first to draw the sword, I shall be the last to sheath it. They have no regard to treaties, henceforth they should cover them with black crape.' In a few minutes he came back to me, and resumed the conversation by something personally civil to me. He began again, 'Why these armaments?' Against what are these measures of precaution? I have not a single ship of the line in the ports of France; but if you wish to arm, I will arm also. If you wish to fight, I will fight also. You may perhaps destroy, but you will never intimidate France. We wish neither the one not the other. It is our desire to live in good understanding with her.' 'You must regard treaties then. Confusion to those who have no regard to treaties: ('malheur à ceux qui ne respectent pas les traités !') they will be responsible for it to all Europe.' He was too much agitated to make it advisable for me to prolong the conversation. I therefore made no answer; and he retired to his apartment repeating the last phrase. It is to be remarked, that all this passed loud enough to be heard by two hunthere was not a single person who did not feel the impropriety of his conduct, and the total want of dignity as well as of decency on the occasion." The negociations in the mean time proceeded; and Bonaparte still insisted upon the literal fulfilment of the treaty of Amiens. He appears to have flattered himself that the British ministry would not venture to renew the war on account of Malta. Their pacific dispositions were well known; they had suffered him to make great encroachments upon the Continent without engaging in hostilities; they were understood to consist of men who were not the leaders of any party, but had only held a subordinate rank as supporters of Mr Pitt's administration; and they had been loudly accused in Britain by the ex-ministers, and by many of the old opposiapparent tameness with which they had recently acted. they would ultimately give way to his demands. But the good temper and forbearance of administration had the effect of rousing the spirit of the British nation, and of inducing, in a large proportion of the people, a wish to enan odious usurper. Thus encouraged, administration rose in their demands; and on the 12th of May Lord Whit- French republic.

which was in substance that the French government should George IIL engage to make no opposition to the cession of the island of Lampedosa to his majesty by the king of the Two Sicilies; that, in consequence of the present state of the island of Lampedosa, his majesty should remain in possession of the island of Malta until such arrangements should be made by him as might enable him to occupy Lampedosa as a naval station, after which period the island should be given up to the inhabitants, and acknowledged as an independent state; that the territories of the Batavian republic should be evacuated by the French forces within one month after the conclusion of a convention founded on the principles of this project; that the king of Etruria and the Italian and Ligurian republics should be acknowledged by his majesty; that Switzerland should be evacuated by the French forces; that a suitable territorial provision should be assigned to the king of Sardinia in Italy; and, in a secret article, that his majesty should not be required by the French government to evacuate the island of Malta until after the expiration of ten years. The proposed stipulations relative to the king of Etruria, the Italian and Ligurian republics, and the king of Sardinia, were merely inserted as make-weights; and accordingly, in an additional article, it was provided that they might be omitted, but that, if inserted at all, they must be inserted together.

This ultimatum having been rejected, war was announced on the 16th of May, by a message from the king to the two houses of parliament; and on the 21st of May a declaration, justifying this measure, appeared in the London Gazette. As the statements contained in this document exhibit a detail of the public acts alleged to have occasioned the renewal of the war, it may be proper to in-

sert a few of its leading paragraphs.

" As soon as the treaty of Amiens was concluded, his majesty's courts were open to the people of France for every purpose of legal redress. All sequestrations were taken off their property; all prohibitions on their trade, which had been imposed during the war, were removed; and they were placed on the same footing, with regard to commerce and intercourse, as the inhabitants of any other state in amity with his majesty with which there existed

no treaty of commerce. "To a system of conduct thus open, liberal, and frienddred people who were present; and I am persuaded that ly, the proceedings of the French government afforded the most striking contrast. The prohibitions which had been placed on the commerce of his majesty's subjects during the war have been enforced with increased strictness and severity. Violence has been offered in several instances to their vessels and their property; and in no case has justice been afforded to those who may have been aggrieved in consequence of such acts; nor has any satisfactory answer been given to the repeated representations made by his majesty's ministers or ambassadors at Paris. Under such circumstances, when his majesty's subjects were not suffered to enjoy the common advantages of peace within the territories of the French republic and the countries dependent upon it, the French government had recourse to the extraordinary measure of tien, of want of talents and want of spirit, on account of the sending over to this country a number of persons for the professed purpose of residing in the most considerable sea-It seems likely, therefore, that Bonaparte presumed that port towns of Great Britain and Ireland in the character of commercial agents or consuls. These persons could have no pretensions to be acknowledged in that character, as the right of being so acknowledged, as well as the privileges attached to such a situation, could only be derivgage in a war against a man whom they now detested as ed from a commercial treaty, and as no treaty of that description was in existence between his majesty and the

"There was consequently too much reason to suppose George III that the real object of their mission was by no means of a commercial nature; and this suspicion was confirmed, not only by the circumstance that some of them were military men, but by the actual discovery, that several of them were furnished with instructions to obtain the soundings of the harbours, and to procure military surveys of the places where it was intended they should reside. His majesty felt it to be his duty to prevent their departure to their respective places of destination, and represented to the French government the necessity of withdrawing them; and it cannot be denied, that the circumstances under which they were sent, and the instructions which were given to them, ought to be considered as decisive indications of the dispositions and intentions of the government by whom they were employed.

"If the French government had really appeared to be actuated by a due attention to such a system, if their dispositions had proved to be essentially pacific, allowance would have been made for the situation in which a new government must be placed, after so dreadful and extensive a convulsion as had been produced by the French revolution. But his majesty has unfortunately had too much reason to observe and to lament, that the system of violence, aggression, and aggrandisement, which characterised the proceedings of the different governments of France during the war, has been continued with as little disguise since its termination. They have continued to keep a French army in Holland, against the will and in defiance of the remonstrances of the Batavian government, and in repugnance to the letter of their solemn treaties. They have, in a period of peace, invaded the territory and violated the independence of the Swiss nation, in defiance of the treaty of Luneville, which had stipulated the independence of their territory, and the right of the inhabitants to choose their own form of government. They have annexed to the dominions of France, Piedmont, Parma, and Placentia, and the island of Elba, without allotting any provision to the king of Sardinia, whom they have despoiled of the most valuable part of his territory, though they were bound by a solemn engagement to the emperor of Russia to attend to his interests, and to provide for his establishment. It may indeed with truth be asserted, that the period which has elapsed since the conclusion of the definitive treaty has been marked with one continued series of aggression, violence, and insult, on the part of the French government."

With regard to Malta, the declaration proceeded to state, "that when the French government demanded its evacuation, several articles of the treaty of Amiens respecting it remained unexecuted. The tenth article had stipulated that the independence of the island should be placed under the guarantee and protection of Great Briemperor of Germany had acceded to the guarantee, but only on condition of a like accession on the part of the other powers specified in the article. The emperor of Russia had refused his accession, except on the condition King of Prussia had given no answer whatever to the apthe constitution of the order since the conclusion of the treaty of peace. It was to the order of St John of Jerusalem that his majesty was by the first stipulation of the tenth article bound to restore the island of Malta. The existence at the time of the conclusion of the treaty. tual invasion, the whole male population of the kingdom,

The three French langues having been abolished, and a Reign of Maltese langue added to the institution, the order con-George III sisted therefore at that time of the following langues, viz. Arragon, Castile, Germany, Bavaria, and Russia. Since the conclusion of the definitive treaty, the langues of Arragon and Castile have been separated from the order by Spain, and part of the Italian langue had been abolished by the annexation of Piedmont and Parma to France. There is strong reason to believe that it has been in contemplation to sequestrate the property of the Bavarian langue, and the intention has been avowed of keeping the Russian langue within the dominions of the emperor.

The French were also accused of having instigated or effected the whole of these changes, and of thus having rendered it impossible to fulfil that part of the treaty; and it was further remarked, that from a report published by an accredited agent of the French government, Colonel Sebastiani, it appeared that France entertained views hostile to the Turkish empire, the integrity of which had been expressly stipulated, and that this rendered the retention of Malta more necessary. The behaviour of the first consul to Lord Whitworth at his audience was also noticed, together with some other offensive occurrences; and it was observed that "his majesty might add to this list of indignities, the requisition which the French government have repeatedly urged, that the laws and constitution of this country should be changed, relative to the liberty of the press. His majesty might likewise add the calls which the French government have on several occasions made to violate the laws of hospitality, with respect to persons who had found an asylum within his dominions, and against whose conduct no charge whatever has at any time been substantiated. It is impossible to reflect on these different proceedings, and the course which the French government have thought proper to adopt respecting them, without the thorough conviction that they are not the effect of accident, but that they form a part of a system which has been adopted for the purpose of degrading, vilifying, and insulting his majesty and his government.

Administration were now placed in a very singular situation. Mr Fox, who opposed the war, proposed that an attempt should be made to prevail with the emperor of Russia to mediate a peace, upon the supposition that, if his mediation was rejected by France, we might be able to secure an alliance with him; and to this proposal administration acceded; but although Mr Fox opposed the war, almost the whole of the other members of the old opposition, including Mr Sheridan and Mr Tierney, strongly approved of it, while Mr Pitt and the rest of the exministry joined in the opinion. As Bonaparte had threatened to attempt an invasion, the parties out of power laid hold of this circumstance to excite alarm, and industriously tain, France, Austria, Russia, Spain, and Prussia. The represented the actual ministers as men of moderate capacity, unfit to be intrusted with the defence of the empire in a perilous crisis. Mr Pitt and his colleagues, in their speeches in parliament, represented the nation as in danger of being instantly invaded by an innumerable host of expethat the Maltese langue should be abrogated; and the rienced troops, who could not be expected to delay more than a few days the attempt to land upon our shores; the plication which had been made to him to accede to the members of the old opposition held precisely the same lanarrangement. That the fundamental principle upon which a guage; and the views of both probably were in some degree depended the execution of the other parts of the article to terrify the country to call for their services, as men of had been defeated by the changes which had taken place in greater energy than the present rulers. The militia, both ordinary and extraordinary, were called out; a new body of troops was ordered to be raised by ballot, under the appellation of an army of reserve; and corps of volunteers were formed throughout the whole island. An act of order is defined to consist of those langues which were in parliament was also passed for calling out, in case of ac-

Reign of in classes according to their age or their situation in life; make those efforts and sacrifices which the honour and Reign of of the augmentation of the navy, the income tax was restored with certain modifications.

The administration thus found their adversaries, unlike any former opposition, striving with emulation to do their work for them, and to strengthen government by new armaments of every kind. The consequence was, that during the ensuing autumn, ministers seemed to become perplexed by the multiplicity of business in their hands, and to entertain doubts about the propriety of some of the measures in which they had embarked. The plan of raising such numerous bodies of troops by ballot, while substitution was at the same time permitted to those upon whom the ballot fell, became a most unequal mode of raising an army for the defence of the state, as it fell upon their age. But it was attended with one good effect, that as the bodies of volunteers raised by permission of government enjoyed an exemption from certain ballots, this operated, along with the spirit of the country, as a sufficient premium to induce great multitudes of persons to enrol themselves for the purpose of acquiring the military exercise. Ministers at times hesitated to receive the numerous bodies of volunteers who offered themselves; but as they afterwards departed from this reluctance, nearly four hunclusive of the regular army, the militia, and the army of reserve.

In the meanwhile the ports of France were closely blockaded, and the foreign possessions of the French seized; while the only step of retaliation in their power to exert consisted in seizing the electorate of Hanover, which they plundered unmercifully. Bonaparte offered to give up Hanover as the price of Malta; but his offer was refused.

The most inconvenient circumstance to Great Britain, arising out of those political transactions, consisted in the great embarrassment occasioned to persons engaged in commerce, which proved the cause of numerous bankruptcies. Towards the close of the former war trade had found out for itself regular channels; and, in particular, the port of Hamburg had become the great store-house of British merchandise, from which, as a neutral state, it was distributed amongst the countries engaged in the war. The conclusion of a treaty of peace produced the daily expectation of a renewal of the intercourse with France, and therefore put a stop to the circuitous trade by Hamburg. But as no place was substituted instead of the latter, a suspension of operations in some manufactures occurred; and when these difficulties were coming to a close, the renewal of the war produced a new uncertainty as to the channels in which the European trade would hereafter flow. The difficulty was increased in consequence of the invasion of Hanover by the French, and their excluding the British from the navigation of the Elbe, while the latter in their turn blockaded the river with ships of war, and thus excluded all the world.

Parliament assembled on the 22d of November. In the speech from the throne his majesty said,—" Since I last met you in parliament, it has been my chief object to carry into effect those measures which your wisdom had adopted for the defence of the united kingdom, and for the vi-gorous prosecution of the war. In these preparations I have been seconded by the voluntary exertions of all ranks of my people, in a manner that has, if possible, strengthened their claims to my confidence and affection. They have proved that the menaces of the enemy have only served to rouse their native and hereditary spirit; and that all other considerations are lost in a general disposition to

George III- and to meet the expense of these different armaments, and the safety of the kingdom demand at this important and George III. critical conjuncture. Though my attention has principally been directed to the great object of internal security, no opportunity has been lost of making an impression on the foreign possessions of the enemy The islands of St Lucie, Tobago, St Pierre, and Miquelon, and the settlements of Demerara and Essequibo, have surrendered to the British arms. In the conduct of the operations by which these valuable acquisitions have been made, the utmost promptitude and zeal have been displayed by the officers employed in those services, and by my forces acting under their command by sea and land. In Ireland, the leaders and several inferior agents in the late traitorous conspiracy have been brought to justice, and the public tranquillity has experienced no further interruption. I persons not according to their means, but according to indulge the hope that such of my deluded subjects as have swerved from their allegiance are now convinced of their error; and that having compared the advantages they derived from the protection of a free constitution, with the condition of those countries which are under the dominion of the French government, they will cordially and zealously concur in resisting any attempt that may be made against the security and independence of my united king-

The usual address to the throne was unanimously cardred thousand men were trained to the use of arms, ex- ried, though Mr Fox complained that nothing had been said respecting the state of our negociations with Russia. The debates in parliament during the present session were by no means interesting. In the course of the winter, the French government continued to repeat with much confidence their threats of invasion, and the people of Great Britain remained in daily expectation that a landing would be attempted. But nothing of any importance took place. Bonaparte travelled repeatedly from Paris to the sea-coast, and back again to Paris. It was announced that a body of guides had been formed to conduct the invading army after it had landed in England; and the generals and admirals by whom the expedition was to be conducted were said to have gone to their respective posts. Nothing however occurred, excepting the sailing from one French port to another, under the cover of land-batteries, of small parties of flat-bottomed boats, which, at times, evaded the vigilance of the British cruisers, though they were frequently captured, driven ashore, or sunk.

The parliamentary proceedings in the summer session of 1803 were remarkable, as indicating the existence of three or four distinct parties, amidst an almost general concurrence in support of the war. These parties were, first, that of the ministry and their usual followers; secondly, that of the Grenvilles and Mr Windham, who had all along blamed the peace of Amiens, and predicted that it would prove a mere truce; thirdly, that of Mr Pitt and Lord Melville, who, after approving that peace, had, on supporters of war; and, fourthly, that of Mr Fox, with a part of the old opposition, who were of opinion that the war might have been avoided. But the last were so far from being numerous, that a motion, made on the 23d of May, to express the concurrence of parliament in the war, was opposed by a minority of only ten in the Peers and sixty-seven in the Commons. A subsequent measure, in the same spirit, namely, an act for arming a large part of the population, was carried in July by a great majority; and similar ardour was evinced in submitting anew to war taxes, particularly to a five per cent. income-tax. After the adoption of several other measures of a like descripliament was prorogued on 12th August.

The next session opened on the 22d of November, and discovered the same alacrity for the prosecution of the war, mixed, however, with a growing opposition to ministers. Mr Pitt had, from the beginning of the war, foreborne to commend them, and, since the failure of a negociation to bring him into office, had assumed a language occasionally hostile. He continued to support their propositions for the public defence, and frequently improved them in their progress through parliament; but he disclaimed all personal connection with ministers, and at last treated them as incapable of originating any measure of vigour or utility. This disposition could scarcely fail to be turned to account by those busy intermediaries, who find means to combine the efforts even of opposite parties for the purpose of getting into power. On the 15th of March Mr Pitt, aware of the side on which the public was most alive to alarm, brought forward a motion for an inquiry into the management of the navy. On this occasion, severe as was his language in regard to Lord St Vincent, then at the head of the admiralty, he received the support of the opposition, and had on his side a hundred and thirty votes against two hundred and one. From this On the 23d of April Mr Fox brought forward an eagerlyexpected motion on the defence of the country, in which Mr Pitt joined, with great animosity against the ministers. On a division, government had a majority of fifty-two, which, in a second debate, on the 25th of April, was reduced to thirty-seven. Soon after this, ministers resigned, and Mr Pitt, called to the royal presence, was desired

The Grenvilles had recently so connected themselves with Reign of Mr Fox and his friends, that a separation would have been George II1 altogether dishonourable; and their united strength, joined to the occasional support of Mr Addington's adherents, was the cause, during the remainder of the session, of very strong divisions against the new ministers, particularly in Their chief measure, entitled the Addithe Commons. tional Force Bill, was carried by only two hundred and sixty-five to two hundred and twenty-three. The session soon afterwards closed, but not without passing a corn bill, evidently intended to dispose the landed interest to submit to the new taxes, and prohibiting the importation of foreign wheat whenever our own should be at or below sixty-three shillings the quarter.

On the continent of Europe, the only great operation was the invasion, or rather occupation, of Hanover, to which allusion has already been made. War having been declared by us on the 18th May, the French troops advanced from Holland, and entered the electoral capital by the 5th of June. To attempt resistance would have been folly; but in a season when soldiers were so much wanted in England, and so great an expense was incurred in trainthe continued aggressions of Bonaparte, become ardent ing them, it was matter of regret that the Hanoverian troops, in number about fifteen thousand, should not have been marched down to the coast, and embarked in a body, instead of being disbanded and obliged to pledge themselves not to serve against France until exchanged.

On the side of France the aspect of war was displayed in a great encampment at Boulogne, and in the dispatch, from all the ports along the coast, of flotillas of boats to join the armament preparing in that central rendezvous. These petty convoys had instructions to tempt our cruisers to attack them, and to draw them, at fit occasions, under the fire of land-batteries; and they were sometimes successful in doing so. The main object of Bonaparte tion, and a most interesting session of nine months, par- was to excite alarm; a course which, however politic toward some countries, was certainly ill judged in regard to one where the executive power, in its inability to coerce, often seeks support in the apprehensions of the public. The general impression of dread facilitated the measures of defence, and led to the volunteer system, which was carried to an unparalleled extent. Never did a country exhibit so many of the middle and higher classes under arms as England and Scotland in 1803; and never did individuals in these stations make more personal sacrifices for the object of national defence. The result was effectual to as great a degree as the situation of the individuals permitted. The volunteers made as near an approach to regularity of discipline as was practicable in the case of men full of ardour, and submitting for a season to the restraint of military service, but necessarily devoid of experience in the field. The error lay in carrying volunteering too far; for the system ought never to have been allowed to extend to a length that absorbed no inconsiderable part of the time and money of men whose lives were too valuable to be indiscriminately exposed, and whose proper aid to the public cause was the tribute of their industry. The volunteer system was of real use only in as far as it promoted cordiality in the common cause, and, time forward the strength of ministers was visibly shaken. by assuring the maintenance of tranquillity at home, enabled government to dispose of the regulars in the field.

The plan of collecting flotillas of boats, from east to west, in the central depôt of Boulogne, was continued by Bonaparte, during two years, from the middle of 1803 to that of 1805. A great parade was made of the number of troops ready to embark, and of the determination to encounter all hazards; but there was no efficient support to form an administration, exclusive, however, of Mr Fox. by ships of war, until the spring of 1805, when the sailing This peremptory order, and Mr Pitt's too ready acquies- of squadrons for the West Indies took place, first from cence in it, proved the source of the greatest difficulties. Rochefort, and afterwards from Cadiz. These, it was cal-

ously into the calculations of the French ruler. That it did so at this time was positively affirmed by him in conversations held with English gentlemen in the island of Elba, and afterwards in that of St Helena; but these conversations were marked by sundry misrepresentations; for he attributed the non-execution of the attempt entirely to the threatened coalition on the Continent, and would not acknowledge that it was impracticable ;--a matter of nautical calculation, when our government kept our channel fleet at home, instead of sending it, as he had anticipated, to the West Indies.

Such was the aspect of the war during two years, in which our naval superiority led to an easy conquest of several of the Dutch and French West India colonies. St Lucie surrendered on the 22d of June 1803; Tobago, on the 1st of July; Demerara and Berbice, on the 23d of September; and Cape Town, the last spot in the French half of St Domingo, occupied by French troops, capitulated to the Blacks on the 30th of November. Next year was taken the small island of Goree, on the coast of Africa, and soon after the important Dutch colony of Surinam. On the other hand, we were not successful in our attempts on the French flotillas on their own shores. One of these was directed against a convoy on the coast between Flushing and Ostend; another, on a larger scale, and very different plan, was pointed at the Boulogne armament, which it was proposed to blow up by catamarans; an attempt no less unsuited to open and generous warfare than the torpedoes of the Americans. Fortune was more favourable to us in encounters with the enemy in the open ocean, where, in the early part of 1804, a striking proof of the effects of intrepidity was given in the case of a fleet of merchantmen from China, which beat off, or at least deterred from action, a French squadron under Admiral Linois, consisting of a ship of eighty guns and three frigates.

The war hitherto had been with France and Holland only; but a new power was now to be added to the list of our antagonists. Spain had been allowed by Bonaparte to avoid participating in the contest, on condition of paying a large annual contribution; a condition so contrary to real neutrality, that for some time past our government had kept a vigilant eye on the expected arrival of her treasure ships from America. A small squadron of four frigates, sent out to intercept these valuable supplies, met, on the 5th of October 1804, a Spanish squadron of a similar number proceeding towards Cadiz; and the Spanish commodore refusing to surrender, an engagement ensued, attended with the capture of three of the Spanish frigates, and the explosion of the fourth, accompanied with the loss of many lives. This decisive act, approved at home by the advocates of vigorous measures, was productive of the worst impressions in regard to our national honour both in Spain and her colonies, and led soon afterwards to a declaration of war by that power.

Bonaparte was now provided with additional means of threatening our distant possessions. A squadron of five sail of the line escaping from Rochefort, landed a body of nearly four thousand men on the island of Dominica, and burned the chief town; the island of St Kitt's escaped with paying a contribution and the loss of some merchantmen. But this was only a prelude to the arrival of a much more formidable fleet, which, to the number of eighteen sail of the line, French and Spanish, reached the West Indies in the end of May, and spread alarm throughout the islands; an alarm not dispelled till the arrival of a

Reign of culated, might excite alarm for our colonies, and induce Nelson. The hostile fleet soon after set out on its home- Reign of George III. government to send thither a portion of the men of war ward voyage. Intelligence to that effect was opportunely George III. hitherto reserved for home defence; after which the ha- received by Lord Barham, then at the head of the admizardous attempt of a descent might have entered seri- ralty; and a fleet, detached to cruise on their supposed track, had the good fortune to fall in with them on 22d July. An action took place; two sail of the line, Spanish ships, were captured; night terminated the conflict; and though it might have been renewed on the succeeding days, an unfortunate indecision on the part of our admiral, Sir Robert Calder, allowed the enemy to escape. They soon afterwards repaired to Ferrol, whence they sailed with augmented force, and reached Cadiz.

To watch them there, or to engage them on their coming out, was now an object of the highest moment; and it was to Lord Nelson that this important trust was committed. Joining our fleet off Cadiz on the 20th September, he avoided keeping in sight, and even dispensed with the aid of six sail of the line, which he sent to a distance along the coast; judging that the enemy, when apprized of their absence, would be induced to come out. Accordingly, the combined fleet left Cadiz on the 19th of October, to the number of thirty-three sail of the line, eighteen French and fifteen Spanish, commanded by Admiral Villeneuve, and early on the 21st came in sight of the British fleet, consisting of twenty-seven sail of the line, off Cape Trafalgar, about half way between Cadiz and Gibraltar. The enemy, convinced that their former defeats at sea had been owing to the want of concentration and mutual support, now formed a double line, every alternate ship being about a cable's length to windward of her second ahead and astern, so that any of our ships, attempting to penetrate, would be exposed to the fire of two or of three antagonists. Nelson, while yet distant, perceived their arrangement, and understood its object. It was new, but he was satisfied that no concentration in the open sea could prevent our vessels from coming to close action with their opponents, in which case the result could not long be doubtful. He consequently made no alteration in his previous plan, which was to make the order of sailing the order of battle, the fleet being in two lines, with an advanced squadron of eight of the fastest sailing two-deckers; but directed the fleet to advance to the attack in two divisions, one of which, under Admiral Collingwood, intersected that part of the enemy's line which gave it nearly an equal number of ships to encounter; whilst Nelson, with the other division, acted on a similar plan. Such was the only general manœuvre in this great action. By our superior seamanship, and our ships keeping near each other, we had in some cases a local superiority; but the general character of the fight was a conflict of ship to ship; and its decision in our favour was owing to that skill in working the guns, to that dexterity in an occasional change of position, and that confidence of success which characterizes a naval force in a high state of discipline. Our loss, amounting to sixteen hundred men, was in part caused by the riflemen in the enemy's rigging; an ungenerous mode of warfare, which may deprive an opposing force of officers, but can have little effect on the general issue of a conflict. The fighting began at noon, became general in less than half an hour, and lasted from two to three hours; in the case of a few ships it continued longer, but all firing was over by half-past four o'clock. The victory was complete, but purchased by the death of Nelson, who was mortally wounded by a musket ball fired from the mizen-top of the Redoutable, by one of the enemy's riflemen, and expired just as the action closed. Nineteen sail of the line struck; but unfortunately gales of wind, after the action, wrecked part of our prizes, and necessitated the destruction of others. Four sail, however, were preserved; and four more. force inferior by nearly one third, but commanded by Lord which had escaped, under Rear-admiral Dumanoir, were

Reign of met on their northward course, on the 2d of November, Whitbread, was lost by two hundred and seventy-two to Reign of George III and captured off Cape Ortegal, by a squadron under Sir Richard Strachan.

But upon the continent of Europe the course of public events was very different. The year had been ushered in by a letter of Bonaparte to our sovereign, containing pacific expressions couched in general terms. An answer was given, not by the king, but, according to diplomatic usage, by our minister for foreign affairs, to the French minister in the same station, expressing a similar wish for peace, but adding, that it was incumbent on us to consult our allies, particularly the emperor of Russia. The French ridiculed the assertion of our being on confidential terms with that court; but Russia had in fact begun to listen to the proposal of forming a coalition against France on an extensive scale. The basis of this compact was a treaty signed at St Petersburg in April. Russia, Austria, Sweden, Naples, all acceded to it, and hopes were entertained of the co-operation of Prussia. Bonaparte, apprized of this, affected to be absorbed in arrangements for immediately invading England, but secretly prepared to marcin his troops from Boulogne to the Rhine. After throwing on the Austrians the odium of aggression, by allowing them to attack Bavaria before he acted, he proceeded to execute a plan singularly adapted to the overweening confidence of his opponent, General Mack, who by this time had traversed Bavaria and advanced to Ulm. By executing forced marches, and violating part of the neutral territory of Prussia, Bonaparte reached first the flank, and soon afterwards the rear, of the enemy, who clung with blind pertinacity to the position of Ulm. The result to the Austrians was a series of checks in the field, and eventually the surrender, by capitulation, of more than thirty thousand men. The road to Vienna was thus opened to Bonaparte. He marched thither, crossed the Danube, proceeded northward, and at Austerlitz, on the 2d of December, displayed his military combinations in all their lustre, gaining over the Austrians and Russians, with forces not superior, a victory which compelled Austria to immediate peace; and thus by one blow broke up the coalition.

Before the opening of the session of 1805, an over-ture, suggested, it is said, by the sovereign personally, was made to Mr Addington; and, after some discussion, it was accepted, Mr Addington receiving the presidency of the council for himself, and corresponding situations for his friends. With this support ministers met parliament; and in one of the first great questions the approval of the war with Spain obtained the concurrence of three hundred and thirteen votes against a hundred and six. In subsequent divisions, the majorities, though less decisive, were considerable, until the 6th of April, when Mr Whitbread brought forward a most interesting discussion on the tenth report of the commissioners of naval inquiry, which implicated Lord Melville. This question, debated in a full house, produced a division of two hundred and sixteen against two hundred and sixteen, when, after a most anxious pause, the resolutions moved by Mr Whitbread were carried by the casting vote of the speaker. This led immediately to the resignation by Lord Melville of his office of first lord of the admiralty, and was followed by the erasure of his name from the list of privy counsellors. Some time after, his lordship was, at his own desire, heard before the House of Commons; and whilst he acknowledged that temporary irregularities in the appropriation of the public money had taken place when he was treasurer of the navy, he disclaimed, on his honour, the alleged participation in the profits of Mr Trotter, who had acted as his paymaster. But the expectations of the public were raised, and a prosecution, in some shape or other, was indispensable. A motion for an impeachment before the Lords, made by Mr and in Austria.

a hundred and ninety-five; but the Addington party join-George ITL ing opposition in a motion for a criminal prosecution, the latter was carried by two hundred and thirty-eight against two hundred and twenty-nine. Lord Melville and his friends, dreading this more than an impeachment, found means, by a sudden division of the house, to rescind the vote to that effect, and to decide on an impeachment before the Lords. And parliament was prorogued after giving ministers a vote of credit to the extent of three millions, to be applied, if necessary, in subsidies to continental powers.

The proceedings against Lord Melville made a deep impression on Mr Pitt, and deprived him of his only efficient coadjutor, at a time when, from the magnitude of his public cares, he was more than ever in want of support. The consequent fatigue and anxiety made severe inroads on a constitution naturally not strong. His indisposition became apparent in the early part of winter, and, on the meeting of parliament, it was understood to have reached a dangerous height. His death took place on the 23d January 1806. A motion, brought forward a few days after, to grant a public funeral, and to erect a monument to the late excellent minister, excited much discussion. Mr Fox paid a high tribute to the financial merits of his great rival, which, in fact, were extremely questionable; but he could not join in ascribing the epithet of "excellent" to measures which he had so often opposed. Mr Windham also opposed the vote; and the Grenvilles chose to be absent. Still the motion was carried by two hundred and fifty-eight against a hundred and sixty-nine. To a subsequent proposition for a grant of L.40,000 for the payment of Mr Pitt's debts, no opposition was made.

The public attention was now fixed on the approaching change of ministry. The king, in concurrence, it is said, with the death-bed recommendation of Mr Pitt, sent for Lord Grenville, desired him to form a ministry, and made no opposition to the admission of Mr Fox into the cabinet; but he is said to have expressed a desire that the Duke of York should retain the office of commander-in-chief The new administration was formed on a broad basis, comprising the friends of Lord Grenville, those of Mr Fox, and those of Lord Sidmouth. But hardly had they entered upon office when circumstances occurred which placed in a striking light the different conduct of men when in and out of power. Lord Grenville thought fit to hold the incompatible offices of first lord and auditor of the treasury, and the chief justice was admitted to a seat in the cabinet, whilst Mr Fox consented to come forward

as the vindicator of both.

The defence of the country against the great military power of France being still the most anxious consideration, the first measure of a comprehensive nature was brought forward by Mr Windham, whose station in the new ministry was the war department. It proposed the repeal of Mr Pitt's additional force bill, and a plan for improving the regular army, by substituting a limited for an unlimited term of service, and by granting a small increase of pay after the expiration of the prescribed term. These propositions, brought forward in the end of April and beginning of May, were warmly opposed: they passed, however, by a great majority in both houses, and would, doubtless, have conduced materially to the improvement of our army had they received a fair trial; but the succeeding ministries sought, during the whole war, to procure enlistments for life. In France, since 1817, the rule is, to be scrupulous about the character of recruits, to give little or no bounty, but to limit the period of service, and to increase the pay after the expiration of the specified term. The same principle, differently modified, prevails both in Prussia

Of the budget, the most remarkable feature was an in-George III. crease of the property-tax from six and a half to ten per cent., the odium of which ministers sought to lessen by the appointment of a board of auditors to examine the long-standing arrears in public accounts. In regard to trade, the principles of this ministry, though little understood, and even disliked by the great majority of merchants, were entitled to much attention. They attempted to introduce into our practical policy some of the doctrines of Dr Smith, doctrines which Mr Pitt had studied in his early years, but to which circumstances had not allowed him to give an extensive application. The letter of our navigation laws forbade all intercourse between our colonies and other countries; but our West India colonies were, in time of war, so dependent on the United States for provisions, that it had been customary with the island governors to take on themselves the responsibility of infringing these acts, and to obtain regularly a bill of indemnity from parliament. Mr Fox now brought in a bill termed the American Intercourse Act, the purport of which was, to authorize the governors of our colonies to do, during the remainder of the war, that which they had hitherto done from year to year, and to dispense with any application for indemnity. This bill, moderate and politic as it in fact was, met with keen opposition in parliament, and with still keener out of doors from the shipping and commercial interests. It passed into a law; but it was denounced as a glaring infraction of our navigation code, and contributed, more than any other measure, to shake the popularity of ministers.

The trial of Lord Melville before the House of Peers began on the 29th of April 1806. The charges against him, little understood by the public at large, related to an infraction of his official duty, not as a member of the cabinet, but in his early and inferior station of treasurer of the navy. These charges may be comprised under the following heads: That he had allowed Mr Trotter, his paymaster, to take the temporary use and profit of sums of money lodged in the bank for the naval expenditure; that he had himself participated in such profits; and, finally, that he had applied certain sums of the public money to his private use. All participation in the speculations or profit of his paymaster his fordship positively denied, but he acknowledged a temporary appropriation of the sum of L.10,000 in a way which private honour and public duty forbade him to reveal. The trial closed on the 12th of June. The articles of impeachment had been extended to the number of ten, and on all of them there was a majority of peers for his acquittal; but whilst in regard to the charge of conniving at stock speculations by Trotter, or converting the public money to his private use, the majorities were triumphant, the case was otherwise in regard to his lordship's permitting an unauthorized appropriation of the public money by Trotter, and receiving from him temporary loans, the records of which were afterwards

Though the present parliament had completed only four sessions, ministers determined on a dissolution, doubtless from a wish to have the benefit of the government influence in the new elections. They knew their weakness at court, and flattered themselves that a decided ascendency in parliament would enable them to press, with greater confidence, measures for which they could not boast the cordial concurrence of their royal master. For the time of the new election they chose the moment of national excitement caused by the recal of our ambassador from the French capital. The first debate in the new House of Commons related to the abortive negociation for peace; and although the publication of the official papers excited some surprise, and showed that Bonaparte had at one bation of the bill to ministers, who endeavoured to modify

time carried his offers of concession considerably farther Reign of than the public had supposed, there prevailed so general George III a distrust towards him, that Mr Whitbread stood almost alone in the opinion that the negociation ought to have been continued. After some renewed discussions on Mr Windham's military measures, Lord Henry Petty, then chancellor of the exchequer, brought forward a plan of finance, which, assuming the expense of the current year as equal to that of subsequent years of war, professed to provide, without new taxes, for a contest of fourteen years or more. This plan contained an anticipated calculation of the loans necessary for several years to come, and supposed that a sum equal to ten per cent. on each loan should be appropriated from the war taxes, of which five per cent. should serve to pay the interest of the loan, and the other five per cent. form a sinking fund, which, by the operation of compound interest, would redeem the capital in fourteen years; leaving the whole ten per cent. again applicable to the same purpose should the war continue. That this plan possessed, no more than those of Pitt or Vansittart, the merit of increasing the productive power of our revenue, has been already shown by Dr Hamilton in his well-known Treatise on the National Debt. Its merit, had it been tried, would have been found to consist, as that of such plans generally does, in a support, perhaps a temporary increase, of public credit. It may even be questioned whether the same ministry, had they continued in office, would have restricted themselves to a limited expenditure in 1808, when the Spanish struggle called forth such a burst of national enthusiasm. There cannot, however, be a doubt that they would have avoided the orders in council, which, by depriving us of the unseen but powerful aid of neutral traffic, gave the first great blow to our bank paper, and consequently to our public funds.

1806.

The bill for the abolition of the slave-trade was now brought forward with all the weight of government support, and carried by triumphant majorities; in the Lords by a hundred to thirty-six, in the Commons by two hundred and eighty-three to sixteen. This prompt termination of a struggle of twenty years showed how easily the measure might have been carried had not Mr Pitt declined to give it ministerial support; a course suggested to him probably by a dread of offending the West India planters, but founded in a great measure on misapprehension, since the most respectable part of that body, the proprietors of long-settled estates, were far from being adverse to the abolition, calculated as it was to prevent that superabundance of produce which to them is the most serious of evils. This proved the last important bill of the Grenville ministry, whose removal from office took place very unexpectedly, in consequence of a difference with the so-

vereign about the Irish Catholics.

The bill which produced this sudden change was introduced by Lord Howick on the 5th of March, and entitled, " A bill to enable his majesty to avail himself of the services of all his liege subjects in his naval and military forces in the manner therein mentioned;" that is, by their taking an oath contained in the bill, after which they should be left to the free exercise of their religion. Here, as in the case of the American intercourse with the West Indies, the intention was less to introduce a new practice, than to permit by law what was already permitted by connivance. The draught of the bill had been previously submitted to the king, and returned by him without objection; but the royal attention was more closely drawn to it on its introduction into parliament, and on a vehement opposition from Mr Perceval, who described it as part of a system of dangerous innovation, and as a precursor of the abolition of all religious tests. The king now intimated his disappro-

Reign of it, but still without succeeding in rendering it acceptable effects had not been most beneficially displayed in the ad-Reign of the proposed measure, and of bringing it forward at a future period. This minute was unfortunately couched in terms too positive, if not disrespectful to the king, who, always tenacious on the Catholic question, and never personally cordial with Lords Grenville and Howick, insisted that they should pledge themselves in writing never to press him again on the subject. Ministers declining to comply, the king consulted with Lord Eldon about forming a new ministry, and, receiving a ready assurance of the practicability of such a measure, refused to listen to a modified acquiescence with his late order, offered rather tardily by Lord Grenville. Ministers gave up the seals of office on 25th March; and next day the change and the causes which led to it were fully discussed in parliament. A short adjournment now took place, after which there occurred some remarkable trials of strength between the two parties. An independent member, Mr Brand, with reference to the conditions on which the ministry had come into office, made a motion, that it was contrary to the duty of members of the cabinet to restrain themselves by a pledge from advising the king on any subject. This motion produced a very long debate, but was lost by two hundred and fifty-eight against two hundred and twentysix; while a corresponding motion in the Lords was lost by a hundred and seventy-one to ninety. A subsequent proposition, to express the regret of the house at the removal from office of so firm and stable an administration, was lost by two hundred and forty-four against a hundred and ninety-eight; and it became apparent, that in parliament, as at court, the fall of the Grenville ministry was decided.

It remains to make a few observations on their conduct when in office; and here an impartial inquirer will not be long in discovering that both their merits and demerits have been greatly exaggerated. Their war measures proved unimportant, particularly in the point which, in the then ardent state of the public mind, superseded all others -the annoyance of France; and the result was, an unconsciousness in the greater part of the people of what was really valuable in their views and conduct. Yet Mr Fox brought to the department of foreign affairs an intimate knowledge of continental politics, and an exemption from national prejudices, far, however, from being accompanied, as the vulgar supposed, by an indifference to our national interests. Lord Grenville, if naturally less conciliating, and less fitted for grand views, possessed a practical knowledge of business, and had become aware in retirement of the various errors which had arisen from a too early introduction into office. They had a liberal feeling towards Ireland and the United States; and though by no means lukewarm in their resistance to Bonaparte, they all held the impracticability of making any impression on his power by force of arms, until the occurrence of some combination of circumstances which should justify a grand and united effort. In what manner they would have acted had they been in power when the general insurrection in Spain burst forth, the public have no means of judging; so different is the language, and even the feeling, of politicians when in and out of office. Several of their measures, such as the introduction of the lord chief justice to a seat in the cabinet, and the assent to the appointment of such a commander as Whitelocke, were singularly ill-judged. To place Lord Grey, and after him Mr T. Grenville, at the head of the admiralty, was to declare to the public that professional knowledge was unnecessary in that high station, as if its

George III to their sovereign. They then felt the necessity of with- ministration, short as it was, of Lord Barham. Finally, George III. drawing the bill, but inserted in the cabinet minutes a their intemperate declaration in the cabinet minute of the declaration, reserving to themselves two points: the liber- 12th of March evinced a strange miscalculation of their ty of delivering their opinion in parliament in favour of strength, when put in opposition to the personal will of the sovereign and the existing prejudices of the public. The result was, that their fall caused no regret to the majority of the nation, and that the errors of their successors excited no wish for their recal.

Of the new ministry, the efficient members were, Mr Perceval, chancellor of the exchequer; Mr Canning, minister for foreign affairs; Lord Castlereagh for the war, and Lord Liverpool for the home department. One of their first measures was a prorogation of the parliament, followed by a dissolution, which gave them, in the elections, the advantage so lately enjoyed by their predecessors, with the further advantage of an alarm, strangely excited in the public mind, on the ground of popery. The new parliament met on the 22d of June, and, after passing the bills requisite for the army, navy, and other current business, was prorogued on the 14th of August.

The alternation of fortune by sea and land was so great, that 1806 had hardly commenced when fresh successes were obtained over the French navy. A division of the Brest squadron, after landing troops in the Spanish part of St Domingo, was overtaken by a superior force, and three sail of the line captured and two burned. Admiral Linois, returning from India, was captured in the Marengo of eighty guns; and, at a subsequent date, of a squadron of frigates detached from Rochefort for the West Indies, four fell into our hands.

It was under these circumstances that a negociation for peace was for some months carried on at Paris. It began in consequence of an overture from Talleyrand, eagerly embraced by Mr Fox; and Lord Yarmouth, who happened to be under detention in France, was made the first medium of communication and conference. In its more advanced stage, the negociation was intrusted to Lord Lauderdale; and at one period, namely, in September, the conciliatory tone of the French inspired a hope of peace; a hope soon disappointed, when it was found that the offers of Bonaparte were followed by the demand of Sicily, and that, whilst professing an ardent wish for peace, he was extending his usurpations in Germany, and secretly preparing to subvert the power of Prussia.

The humiliation of Austria left Bonaparte at liberty to direct his manœuvres, both diplomatic and military, against her northern rival. Affecting great indignation at the friendly disposition shown by Prussia, in the preceding autumn, towards the coalition, he demanded the cession of a portion of her territory in the south-west, and, in return, transferred to her Hanover, in the hope of kindling the flame of discord between her and England. The Prussians accordingly entered Hanover; the local government making no resistance, and our cabinet taking no retaliatory measure, except the detention of vessels bearing the Prussian flag; a measure adopted, not in the spirit of hostility, but to satisfy popular clamour in England. The discussions between France and Prussia continued during the summer of 1806, and, from the blind confidence of one party, and the artifice of the other, assumed at last a serious aspect. War was declared; the battle of Jena deprived Prussia of her army, her capital, and her fortresses; and her court was fugitive in the north of Poland, ere there had been time to send, or even to concert the sending of succours from England. The Grenville ministry, less eager than their predecessors to embark in continental war, confined themselves to sending a general officer, Lord Hutchinson, to the Russian head-quarters, and to the grant of a limited subsidy. For some time the difficulties of the country, and the firm

resistance of the Russians, particularly at Eylau, encou- reached England, the popular notion that Buenos Ayres Reign of raged the hope of arresting the progress of Bonaparte; but this hope was disappointed by the battle of Friedland, and still more by the approximation of the court of Russia to

The treaty of Tilsit excited alarm, less from its specific provisions, than from the probable consequences of the co-operation of the contracting powers. Among these, some persons reckoned, or pretended to reckon, the equipping against us of the Danish navy, a force of sixteen sail of the line, not manned or ready for sea, but capable of being fitted out without a great sacrifice. The ministry of 1807 founded their claim to public favour on a system of vigour,—on a course altogether opposite to the cautious calculations of their predecessors. No sooner were they apprized of the treaty of Tilsit, than, without waiting for its effect on the Danish government, they determined on the as yet unexampled measure of taking forcible possession of a neutral fleet. A powerful armament of twenty thousand troops and twenty-seven sail of the line, prepared ostensibly against Flushing and Antwerp, was directed to proceed to the Sound, there to await the result of a negociation opened at Copenhagen. This negociation was intrusted to a special envoy, who represented the danger to Denmark from France and Russia, and demanded the delivery of the Danish fleet to England, under a solemn stipulation of its being restored on the termination of our war with France. The Danes, justly offended at this proposal, and aware that their agreeing to it would expose neral Sir John Stuart, in the beginning of July 1806, to them to the loss of the continental part of their territory, refused: our envoy returned on board our fleet: our army was landed, and Copenhagen invested by sea and land, while a part of our fleet cut off all communication between the continent and the island on which it stands. After a fortnight passed in preparations, a heavy fire was opened on the city, and continued during two days with very great effect. A capitulation now took place; the citadel, dockyards, and batteries were put into our hands, and no time was lost in fitting out the Danish men of war for sea. All stores, timber, and other articles of naval equipment, belonging to government, were taken out of the arsenals, embarked, and conveyed to England.

The expedition to Copenhagen excited much discussion and difference of opinion in England, particularly when it ground was, to acknowledge at once that the Danes had given no provocation whatever; that their conduct had been strictly neutral; but that they would evidently have been unable to defend themselves had Russia and France united against them. Still it was extremely questionable, whether we, to ward off a contingent annoyance, should have committed a present aggression. The success of our attempt, considering our naval superiority, the insulated position of Copenhagen, and its unprepared state, admitted of little or no doubt. But this was not all. remained further and more important considerations; the odium that would be thus excited against us in the Danish nation, and that closer approximation of Russia to France, ments of the Baltic.

The Cape of Good Hope surrendered in January 1806 to an armament sent from England. After this, Sir Home Popham, who commanded the naval part of the expedition, ventured to make, without the sanction or even knowledge of government, an attempt on Buenos Ayres. Our troops, although under two thousand in number, effected a landing,

would prove a great market for our manufactures, induced George III. government to take measures for completing the new conquest. And though the inhabitants soon rose and drove out the feeble detachment under Sir Home Popham, an armament, which arrived in January 1807, under the command of Sir Samuel Auchmuty, attacked the strongly fortified town of Monte Video, and carried it by assault, which was conducted with great skill and gallantry. But a very different fate awaited our next enterprise, an attack on Buenos Ayres, planned by General Whitelocke, an officer wholly unfit for this or any other kind of service. Our troops, eight thousand in number, were, under every disadvantage, successful in some parts; but failing in others, the result was a negociation, and a convention that we should withdraw altogether from the country, on the

1807.

condition of our prisoners being restored.

But in another part of the world, and against an ene my in general far more formidable, our arms had been attended with success. Naples had been engaged in the coalition of 1805, with a view to assail the French on the side of Lombardy; but an Anglo-Russian army, landed for that purpose, had been prevented from marching northward by the disastrous intelligence from Germany. They were subsequently re-embarked, the British withdrawing to Sicily, and Palermo becoming once more the refuge of the Neapolitan court. That court, eager to excite insurrection against the French in Calabria, prevailed on Gelead thither a detachment of our troops. They landed, and soon after received intelligence, that at Maida, distant only ten miles from our encampment, was a French corps, already equal to our own, and hourly expecting considerable reinforcements. Our troops marched to attack them on the morning of 4th July, and at nine o'clock drew near to their position, which had a river in front. But General Regnier, who commanded the French, having received his reinforcements the preceding evening, and seeing that our small army was unprovided with cavalry, caused his men to march out of their camp, and advance to charge us on the plain. Our force, including a regiment landed that morning, was nearly six thousand; that of the enemy above seven thousand. The French, who knew our troops only by report, marched towards them with great confidence, was avowed that ministers had no evidence of an intention not expecting them to stand the charge. Our line, howin Russia to coerce Denmark, and still less of a disposition in ever formed, faced the enemy, and advanced; the forward Denmark to give way to such coercion. The only tenable movement of the opposing lines lessening the intervening distance in a double ratio. On a nearer approach the enemy opened their field-pieces, but, contrary to the usual practice of the French artillery, with little effect. Not so the British; for when our artillery opened, every shot told, and carried off a file of the enemy's line. The lines were now fast closing, being within three hundred yards distance, and a fire having commenced between the sharpshooters on the right. At this moment the enemy seemed to hesitate, halted, and fired a volley. The British line also halted, returned the salute, and having thrown in a second volley, advanced at full charge. The enemy, apparently resolved to stand the shock, kept perfectly steady, till, intimidated by the advance, equally rapid and firm, of which could hardly fail to follow so open an affront to a an enemy whom they had been taught to despise, their power professing to take a lead in the political arrange- hearts failed, and they faced about and fled, but not in confusion. When they approached within a short distance of their second line, they halted, fronted, and opened a fire of musketry on our line, which did not follow up the charge to any distance, but halted to allow the men to draw breath, and to close up any breaks in their formation. They were soon ready, however, to advance again; and the order to charge having once more been given, our and occupied the town. Intelligence to this effect having brave troops rushed forward to the onset, the enemy, as

George III. But their courage again failed them; they would not stand the shock; and giving way in greater confusion than before, their first line was thrown upon the second, and both became intermingled in great disorder. Seeing himself thus completely foiled in his attack on the front, and being driven back more than a mile, Regnier now made an attempt to turn the left flank; but this was defeated by the British second line, which, refusing its left, opened an admirably directed and destructive fire, which quickly drove back the enemy with great loss. Their efforts were equally unsuccessful against the right of our line, which also charged in the most gallant and decisive manner, and the field of battle remained entirely in our possession.1 The French loss in killed and wounded was upwards of two thousand; ours only between three hundred and four hundred. This brilliant exploit produced the evacuation of part of Calabria by the French, but had no other result; our small force returning soon afterwards

> Our next operation in the Mediterranean was an unsuccessful menace of the Turkish capital. That court refusing to enter into our plans of hostility to France, our ambassador withdrew, and re-entered the Straits of the Dardanelles with a squadron of seven sail of the line, exclusive of frigates and bombs. They suffered considerably in passing the narrow part of the straits, between the ancient Sestos and Abydos, now called the castles of Romania and Natolia. Anchoring at a distance of eight miles from Constantinople, our admiral, Sir J. Duckworth, threatened to burn the seraglio and the city, but in vain. The Turks continued adverse to our demands, and employed the interval, wasted by the British commander in useless negociations, in strengthening the formidable batteries of the Dardanelles. It soon became indispensable therefore to withdraw, and to repass the straits; but this was not accomplished without a considerable loss in killed and wounded, the cannon at the castles being of great size, and discharging granite balls, one of which, weighing eight hundred pounds, cut in two the mainmast of the Windsor man of war. A descent made soon after in Egypt was equally unfortunate. A detachment of troops landing at Alexandria, occupied that town, but suffered a severe loss at Rosetta, and eventually withdrew, on the Turks consenting to give up the prisoners they had taken. Peace was soon after concluded with the Turks, and our opera-Ionian Islands from the French. Zante, Cephalonia, Ithaca, and Cerigo, were taken by a small expedition in 1809, and Santa Maura the succeeding year.

> On the side of Sicily, our commanders, though pressed by the court of Palermo, refused to make descents on Calabria, which could lead to nothing but partial insurrections, followed, on the return of a superior force, by the death of the most zealous of our partisans. We took, however, in June 1809, the small islands of Ischia and Procida, nearly four thousand Italians, who had landed on this oced to our decided naval superiority, put an end to all attempts of the kind.

The hostility of Russia consequent on her connection with France produced a menaced invasion of Sweden, now our only ally in the north. To aid in repelling it, Sir John

Reign of before, making a show of determination to remain firm. sand men. This force did not land; but the general, repairing to Stockholm, entered into communications with the king, and had the mortification of finding that prince wholly incapable of rational conduct, and bent on projects which would necessarily involve the sacrifice of the British troops. On this he lost no time in returning to Gottenburg, and soon afterwards brought back the armament to England, to be employed on a more promising service.

The influence possessed by Bonaparte over Spain had long inspired him with the hope of overawing Portugal, and of obliging that country to dissolve her alliance with England. To this hope the humiliation of Germany, and his new alliance with Russia, gave double strength; and, in the latter part of 1807, the most peremptory demands were made on the court of Lisbon. To part of these, implying the exclusion of British merchantmen from the harbours of Portugal, compliance was promised; but the demand of confiscating English property, and detaining the English resident in Portugal, was met by a decided refusal. A French army now marched towards Lisbon, and threatened openly to overthrow the house of Braganza; but the latter, after some momentary indications of indecision, took the determination of abandoning their European dominions, and proceeding to Brazil. This spirited, and by many unexpected measure, was carried into effect in the end of November, and Lisbon was forthwith occupied by French troops. A few months afterwards occurred the transactions at Bayonne, and the general declaration of hostility by the Spaniards to Bonaparte. Our cabinet now determined to postpone all other projects to that of a vigorous effort in Spain and Portugal. With that view, an armament of ten thousand men, collected at Cork, and said to be intended for Spanish America, sailed in July for the Peninsula, and offered its co-operation to the Spaniards in Galicia. They, however, thought it best that we should confine our aid to Spain to arms and money, directing our military force against the French army in Portugal. Accordingly, our troops, after passing an interval at Oporto, were landed to the southward, in Mondego Bay, where, after receiving the co-operation of another division of British, and of a few Portuguese, they proceeded on their southward march towards Lisbon. The first actions took place with French detachments at the small town of Obidos, and at Rorica. Neither was of much importance: the French, inferior in number, retreated; but their commander at Lisbon was Junot, an officer trained in the school of tions in the Levant were confined to the capture of the revolutionary enterprise, and disposed, like most of his brethren at that time, to make light of British land forces. He determined forthwith on assuming offensive operations, advanced from Lisbon, and reaching the British army on the 21st of August 1808, attacked it in its position at the small town of Vimiero. The force on either side was about fourteen thousand men. The French marched to the onset in columns, with their wonted confidence; but they had to encounter an enemy equally firm with Germans or Russians, and far superior in discipline, equipnear the coast of Naples; and, in the autumn of 1810, rement, and activity. The principal column of the enemy, pelled an attempt of Murat to invade Sicily. A body of headed by General Laborde, and preceded by a multitude of light troops, mounted the face of the hill forming the casion, were driven back with loss; a failure which, join- crest of the British position, with great fury and loud cries, and, forcing in our skirmishers upon the lines, crowned the summit; but, shattered by a terrible fire of the artillery, breathless from their exertions, and riddled by a discharge of musketry from the fifteenth regiment at half-pistol shot distance, they were vigorously charged in front and flank, Moore was sent to Gottenburg with a body of ten thou- and overthrown.2 Equal success attended our efforts in

Reign of other parts of the line, and the loss of the enemy was three George III. thousand men and thirteen pieces of cannon. The object now ought to have been to follow up our success, before the French had time to recover themselves, and fortify the almost impenetrable mountains on the road to Lisbon. In vain did Sir Arthur Wellesley urge this, first on Sir Harry Burrard, who had now taken the command, and next day on Sir Hew Dalrymple, who arrived and replaced him. Reinforcements were daily expected; and, till their arrival, neither of these officers could be persuaded to incur hazards for the attainment of an advantage which, from their unacquaintance with localities, they were not competent to appreciate. A precious interval was thus lost. The French occupied the passes, opened their negociation in a tone of confidence, and obtained, by the treaty called the Convention of Cintra, a free return to France on board of British shipping. The ministry, though disappointed, determined to defend this convention; judging it indispensable, partly from the communications of Sir Hew Dalrymple, more from its bearing the unqualified signature of Sir Arthur Wellesley, who was, even then, their confidential military adviser. The public, however, called for inquiry; ministers felt the necessity of acceding; the three generals were ordered home from Portugal; and, after a long investigation, and divided opinions, the chief error was found to consist in stopping General Ferguson in the career of victory, when about to cut off the enemy's retreat to Lisbon, and in the loss of the twenty-four hours which followed the battle of Vimiero.

The public disappointment at the convention of Cintra was soon counterbalanced by gratifying intelligence from the Baltic. Bonaparte, whose plan was to subjugate all Europe, by making one nation instrumental in overawing another, had sent the Spanish regiments in his service into Denmark; but he could not prevent their receiving intelligence of the rising spirit of their countrymen, and the vicinity of a British fleet happily facilitated their evasion. Ten thousand Spaniards were thus brought off, and carried, with their arms, stores, and artillery, to join the standard of their country.

Meantime the command of our troops in Portugal was vested in Sir John Moore, and arrangements were made for moving them forward into Spain. But from the badness of the roads, it was necessary to advance in two divisions, one marching due east, and another north-east; while a further force, which had arrived from England at Corunna, was instructed to hold a south-east course. The lateral divisions received, in their progress, orders to adapt the direction of their march to existing circumstances; but the result was, that both converged towards the central division, conducted by Sir John Moore in person.

In their march our officers had an ample opportunity of witnessing the fallacious and exaggerated impressions entertained in England with regard to the supposed enthusiasm of the Spaniards. They saw a country wretchedly cultivated and thinly peopled; a nation hostilely disposed, indeed, to the French, but unaccustomed to exertion, and incapable of combination. Instead of recruits, supplies of provisions, or offers of voluntary service, all was inactivity and stagnation; and, amidst the general poverty, our commissariat had great difficulty in obtaining provisions. Another great source of perplexity was the want of information. The natives, whether in the civil or military service, were too ignorant and credulous to be capable of detecting exaggeration, or of distinguishing truth from falsehood; and our officers were obliged to judge for themselves under the most contradictory rumours.

Sir John Moore reached Salamanca on the 13th of November, aware that the Spaniards had been defeated at Burgos, and soon after apprised that a French corps was advancing

to Valladolid, within sixty miles of his front. In this situ- Reign of ation he received from Madrid the most urgent solicitations George IIL to advance thither with his army, either in whole or in part. He knew the ardour of his country for the cause of Spain, and directed his movements in the view of complying, as far as should be at all advisable, with the representations pressed on him; but day after day the intelligence became more discouraging. At last, the fall of Madrid, ascertained by an intercepted letter of General Berthier, removed every doubt, and left him no other plan but that of uniting his three divisions, and determining on a retreat; but, as his army was now augmented to twenty-five thousand men, he determined, if possible, to strike a blow against the detached French army under Soult, stationed at some distance to the north-east. With this view, cur troops advanced on the 11th of December towards the small town of Sahagun, and a partial action, which took place between the opposite vanguards, was to our advantage; but intelligence arriving that Bonaparte was directing, by the passes of the Guadarama, a superior force on a point in rear of the British, it became indispensable to make a prompt and uninterrupted retreat. Bonaparte. pressing forward with his vanguard, reached our rear at Benavente, saw, for the first time, British soldiers, and witnessed a cavalry action, in which several squadrons of his guard were very roughly handled, and their commanding officer, Lefebre Desnouettes, made prisoner. Meanwhile, Soult, marching by a different road, hoped to cross our line of retreat at Astorga; and the Spaniards having abandoned the position which covered the access to that town, it required both prompt and skilful exertion to enable our army to occupy it before the enemy. Here, pressed as we were, it became necessary to destroy a great part of our camp equipage. Our army was ahead of the enemy, but had before it a long and difficult march over the mountains of Galicia. The weather was severe, provisions scanty, the inhabitants cold and unfriendly; while privations and disappointment relaxed the discipline of our soldiers, who called loudly to be led to action, as the close of their distress. Retreat, however, was unavoidable; and, in this state of suffering and insubordination, the army performed a march of more than two hundred miles; the general keeping in the rear to check the French, who followed with their usual audacity. At Lugo, about sixty miles from Corunna. circumstances seemed to justify our awaiting the enemy, and fighting a general battle. Our soldiers repaired with alacrity to their ranks, but Soult did not accept the challenge, and the retreat was continued. It closed on the 12th January 1809, having been attended with the loss of many men, from disorder, and the sacrifice of many horses, from want of forage, but without losing a standard, or sustaining a single check in action. On the 13th, 14th, and 15th, the sick and artillery were embarked on board our men of war; while the troops remained on shore, to await the enemy, and to cover the reproach of retreat by some shining exploit. This led to the battle of Corunna. On that day our position was good on the left, but very much otherwise on the right; thither, accordingly, the French pointed their strongest column, and thither also Sir John Moore repaired in person. He directed the necessary movements, first to obstruct, and afterwards to charge, the advancing enemy. These orders were gallantly executed, and the attack of the French repelled; but our lamented general received a wound, which soon after proved mortal, from a cannon ball, that struck him on the shoulder, and knocked him off his horse. Subsequent attacks, first on our centre, and next on our left, were equally foiled; and, in the evening, we occupied an advanced position along our whole line. Enough having now been done for the honour of our arms, the embarkation was continued on the 17th, and

Reign of completed on the 18th, after which the whole set sail for campaign, and the retreat of our army under Sir John Reign of George III. England.

1809.

The session of 1808 was opened on 31st January by a speech of uncommon length, which enlarged on the Copenhagen expedition; our relations with Russia, Austria, and Sweden; the departure of the royal family of Portugal to Brazil; and our orders in council respecting neutrals. The chief debates of the session related to these subjects. The Copenhagen expedition was much canvassed, as unprovoked by Denmark, and incompatible with the honour of England. Still that measure received the support of a great majority, Mr Ponsonby's motion for the production of papers relating to it being negatived by two hundred and fifty to a hundred and eight, and a similar motion in the House of Lords by a hundred and five to fortyeight. Even a motion for preserving the Danish fleet, to be restored, after the war, to Denmark, was negatived in both houses.

The volunteer system had, since 1804, been greatly relaxed, and the country evidently stood in need of a more constant and efficient force. The Grenville ministry, adverse to the volunteer system, had determined to let it fall into disuse, and to replace it by a levy of two hundred thousand men, to be trained to act, not in battalions, but separately, and as irregulars, on the principle that local knowledge was the chief recommendation, and a continuance of previous habits the proper exercise, of such a force. The new ministry, however, pursued a different course, and passed an act for a local militia; a body which, with the exception of the officers, was composed of the lower orders, pledged to regular training during one month in the year, and subjected to all the strictness of military discipline. Such of the volunteers as chose were to remain embodied; the total of the local militia was about two hundred thousand, and the mode of levy was by a ballot of all persons, not specially exempted, between the age of eighteen and thirty-one.

The orders in council were frequently discussed during this session, but they were as yet imperfectly understood either in their immediate operation or in their consequences. Unfortunately for the advocates of moderation, Bonaparte now lost all regard to justice, and committed the most lawless of all his acts, the seizure of the Spanish crown. Indignation at this atrocity, and a firm determination to support the Spanish cause, were manifested by men of all parties, among whom were remarkable, as habitual members of opposition, the Duke of Norfolk and Mr Sheridan; the latter making, on this occasion, one of the most brilliant speeches of his latter years.

The session of 1809 was opened on 13th January by a speech declaring a decided determination to adhere to the

Moore. The intelligence that arrived soon after the death George III. of that commander drew from the house a unanimous eulogy of his character, and regret for his fall. There still prevailed, both in parliament and the public, a strong attachment to the Spanish cause; and, in the various motions made by the opposition to censure ministers for mismanaging our armaments, or ill planning our operations, the minority seldom exceeded a third of the members

But the attention of parliament and the public was withdrawn even from this interesting question, and absorbed by the charges against the Duke of York, brought forward by Colonel Wardle, on evidence given or procured by Mrs Mary Anne Clarke, a forsaken mistress of the duke. Ministers, unaware of the extent of the proofs, brought the inquiry before the house instead of referring it to a committee, and a succession of singular disclosures were thus made to parliament and the public. Of these the most remarkable were produced by the friends of the duke persisting in examinations begun under an impression of his entire innocence. It is hardly possible to describe how much this subject engaged the public attention during the months of February and March. Of the influence of Mrs Clarke in obtaining military commissions from the duke, and of her disposing of them for money, there could be no doubt. The question was, whether the duke was apprised of this traffic; and though he might not be aware of its extent, there seems hardly room to doubt that, in certain cases, he suspected its existence. The debate on the collective evidence was uncommonly long, being adjourned from night to night, and exhibited a great difference of opinion on the part of the speakers. Several resolutions, varying in their degree of reprehension, were proposed; and though those finally adopted condemned only the immorality of the connection formed by the duke, without asserting his knowledge of the pecuniary abuses, the result was his resignation of the office of commander-

The success of this investigation prompted an inquiry into other abuses, particularly the sale of East India appointments, and disclosed a negociation of Lord Castlereagh to barter a nomination to a Bengal writership, for the return of a member to parliament. The house declined to proceed to any resolution against his lordship, or to entertain a motion relative to the interference of the executive government in elections. A bill for parliamentary reform, brought in by Mr Curwen, was not directly opposed, but so materially altered in its progress as to be nugatory when it passed into a law. The further business of the session consisted in the annual votes for the public cause of the Spaniards, notwithstanding the failure of the service, and in motions by Sir Samuel Romilly, on a sub-

The following masterly defence of the necessity as well as the conduct of this celebrated retreat, is extracted from Napier's His-

tory of the Peninsular War, vol. i. p. 525.

"Lord Bacon observes, that 'honourable retreats are no ways inferior to brave charges, as having less of fortune, more of discipline, and as much of valour.'

That is an honourable retreat in which the retiring general loses no trophies in fight, sustains every charge without being broken, and finally, after a severe action, re-embarks his army in the face of a superior enemy without being seriously molested. It would be honourable to effect this before a foe only formidable from numbers, but it is infinitely more creditable, when the commander, while struggling with bad weather and worse fortune, has to oppose veterans with inexperienced troops, and to contend against an antagonist of eminent ability, who scarcely suffers a single advantage to escape him during his long and vigor-

ous pursuit. All this Sir John Moore did, and finished his work by a death as firm and glorious as any that antiquity can boast of "Put to Lord Bacon's test, in what shall the retreat to Corunna be found deficient? something in discipline, perhaps, but that fault does not attach to the general. Those commanders who have been celebrated for making fine retreats were in most instances well acquainted with their armies; and Hannibal, speaking of the elder Scipio, derided him, although a brave and skilful man, for that, being unknown to his own soldiers, he should presume to oppose himself to a general who could call to each man under his command by name; thus inculcating, that unless troops be trained in the peculiar method of a commander, the latter can scarcely achieve any thing great. Now Sir John Moore had a young army suddenly placed under his guidance, and it was scarcely united, when the sirperior numbers of the enemy forced it to a retrograde movement under very harassing circumstances; he had not time, therefore, to establish a system of discipline; and it is in the leading events, not the minor details, that the just criterion of his merits is to be sought for.'

Reign of ject which has been but lately followed up with effect, the George III amendment of our criminal law, by lessening the severity, evening by three regiments of infantry, was at first success. George III but insuring the application, of punishments.

The failure, in autumn, of the expedition to the Scheldt, and the resignation of the Duke of Portland when on the verge of the grave, led to the disclosure of a remarkable secret in cabinet history—the attempts made, during several months, by Mr Canning, to obtain from the Duke of Portland the removal of Lord Castlereagh from the war department, on the ground of incompetency to the station. On making this mortifying discovery, the complaint of Lord Castlereagh was, not that his brother minister should think with slight of his abilities, but that, during all the time that he laboured against him, he should have maintained towards him the outward manner of a friend. This led to a duel, followed, not by serious personal injury, but by the resignation of both; causing, in the ministry, a blank which, to all appearance, could be filled only by bringing in the leaders of opposition. An overture to this effect, whether sincere or ostensible, was made by Mr Perceval. Lord Grenville, on receiving it, came to London; Lord Grey, more indifferent about office, answered it from his seat in Northumberland; but both declared a determination to decline taking part in the administration so long as the existing system should be persisted in. Marquis Wellesley, who had gone as ambassador to the Spanish junta, now returned, and was invested with the secretaryship for foreign affairs. Mr Perceval was appointed premier; and the new ministry, feeble as they were in talent, received the support of a decided majority in parliament; so general was the hatred of Bonaparte, and the conviction that our safety lay in a vigorous prosecution of

Our failure in the campaign of 1808-9 was far from discouraging our government from new efforts. Austria was preparing to attack the allies of Bonaparte in Germany; and the Spaniards, though repeatedly beaten in close action, continued a destructive warfare in the shape of insulated insurrections. Sir Arthur Wellesley was accordingly sent with a fresharmy to Lisbon, and General Beresford with a commission to discipline the Portuguese forces. They found the French threatening Lisbon in two directions; from the east, with a powerful force under Victor; from the north, with a less numerous body under Soult. Sir Arthur Wellesley advanced against the latter, drew near his rear guard on the banks of the Douro, drove it over that river, and crossing immediately after, forced Soult to a precipitate retreat from Oporto. Returning to the southward, our commander obliged the force under Victor to draw back; and having, some time after, effected a junction with a Spanish army, took the bold determination of moving forward in the direction of Madrid by the valley of the Tagus. The French now sent reinforcements to the army of Victor, and the opposing forces met at Talavera de la Reyna, a town to the north of the Tagus, near the small river Alberche. The British force was nineteen thousand, and that of the Spaniards above thirty thousand; the French army amounted to upwards of forty-seven thousand men. Lord Wellington was too distrustful of the discipline of his allies to venture an attack on the French, but he saw no imprudence in trying, as at Vimiero, the chance of a defensive action. Stationing the Spaniards on strong ground on the right, he occupied with the British a less strong but yet favourable position on the left. Against the army thus posted the French advanced in the afternoon of 27th July, driving in our advanced post, and attacking an eminence on our left. This eminence, the key of the position, would have been assailed from the beginning by Bonaparte, with a formidable column; but the rifle corps and a single battalion sent against it by Victor were speedily necessary for the allied army to retire; the French divi-

ful, but it was soon repelled by a fresh division of British troops. The main body of the French, surprised at this failure, waited impatiently for morning to renew the attack; they advanced, marched through a destructive fire to the top of the rising ground, approached our cannon, and were on the point of seizing them, when our line rushed forward with the bayonet, and drove them back with great loss. Their commanders now determined to suspend all attacks on the right of the position, and to bring a mass of force against the front and flank of the British left. A general attack took place at four in the afternoon, and the troops directed against the height now consisted of three divisions of infantry, or about eighteen thousand men. Crossing the ravine in their front, the first division scaled the height amidst volleys of grapeshot; but its general fell, a number of officers shared his fate, and retreat became unavoidable. No attempt was now made to carry the eminence in front; attacks were made on its left and right, but all were ineffectual. The left, indeed, was the weak part of the British position; but an event, unfortunate in its immediate results, served to check their audacity in this quarter, and to prevent the renewal of any serious attempt against this part of our line. Sir Arthur Wellesley having observed a French division (Villatte's), preceded by grenadiers, and supported by two regiments of light cavalry, advancing up the valley against the left, while another (Ruffin's) was directing its march towards a mountain which flanked the left transversely, in order to turn it, directed Anson's brigade of cavalry, consisting of the twenty-third light dragoons and the first German hussars, to charge the head of these co-The order was instantly obeyed; the brigade moved off at a canter, and increasing its speed as it advanced, rode headlong against the enemy; but in a few moments it came upon the brink of a cleft which was not perceptible at a distance. The French threw themselves into squares, and opened their fire. Colonel Arentschild, commanding the German hussars, promptly reined up, exclaiming, " I will not kill my young mens;' and it would have been well if the twenty-third had followed the example of the experienced veteran. But English impetuosity was not to be restrained. The twenty-third rode wildly down into the hollow; men and horses fell over each other in dreadful confusion; yet the survivors, still untamed, mounted the opposite banks by twos and threes; and Major Ponsonby rallying all who came up, they passed through the midst of Villatte's columns, reckless of the musketry from each side, and fell with inexpressible violence upon a brigade of French chasseurs in the rear. The combat was fierce but short. Attacked by Victor's Polish lancers and the Westphalian light horse, exposed on both sides to the fire of the squares of infantry, and engaged with the chasseurs in front, they were at length broken; and those who were not killed or taken escaped behind a Spanish division, leaving behind about half the number which went into action. But, however unfortunate in its circumstances, the desperate fury of this charge appalled the French, and effectually checked their advance on a point where the chances of success were otherwise much in their favour. This battle, which was one of hard, honest fighting, reflected little credit on the generalship of either party. The loss on both sides was unusually severe; that sustained by the British, in the two days' fighting, amounting to upwards of six thousand in killed and wounded, and that of the French to about seven thousand four hundred.

Notwithstanding this dear-bought success, it became

1809.

Reign of sions in the north-west of Spain having united and begun capable of discriminating the causes of success or failure Reign of George III. to march in a direction which would soon have brought them on our rear. Our army crossed the Tagus at Arzobispo, and held a south-west course till it reached Badajos, where it remained during the rest of the year, in a position which covered that fortress, and showed the Spaniards that we had not abandoned their cause, however dissatisfied with their co-operation, and convinced of the impracticability of combining offensive operations with such allies.

While by land the fortune of war was thus chequered, at sea the French experienced nothing but disasters. Eight ships of the line in Brest, eluding our blockade, sailed southward to Basque Roads, near Rochefort, where they were joined by four sail of the line from that port. Our fleet blockaded them in their new stations; and preparation having been made to attempt their destruction by fire-ships, Lord Cochrane sailed in with these dreadful engines on the evening of the 11th of April 1809. Our seamen broke the boom in front of the French line, disregarded the fire from the forts, and, after bringing the fire-ships as near to the enemy as possible, set fire to the fusees and withdrew in their boats. The French, surprised and alarmed, cut their cables and run on shore. Four sail of the line that had accompanied Lord Cochrane attacked them, and though the main body of our fleet was prevented by the wind and tide from coming up, the result of our attack, and of the effect of the fire-ships, was the loss of four sail of the line, and one frigate burned or destroyed. At a later period of the year a French convoy of three sail of the line and eleven transports, proceeding from Toulon to Barcelona, was attacked and destroyed by a division from Lord Collingwood's fleet.

Doubtful as was the aspect of the great contest in Spain, it employed a large portion of Bonaparte's military establishment, and revived the hope of independence in Germany. Prussia was too recently humbled, and too closely connected with Russia, at that time the ally of France, to take up arms; but Austria was unrestrained, and thought the season favourable for a renewal of the contest. Her troops took the field in April, and invaded Bavaria under the Archduke Charles, but were worsted at Eckmuhl, after a series of the most splendid military combinations, and Vienna was a second time entered by Bonaparte. His impatience to attack the Austrian army on the north side of the Danube led to his failure in the sanguinary battle of Aspern, and necessitated the advance of almost all his regular troops into the heart of Germany, at a distance of several hundred miles from the coast. But the battle of Wagram at length decided the fate of the campaign, and placed Austria again at the feet of France.

Of the naval stations exposed in consequence of the withdrawal of the troops, by far the most important was Antwerp, situated on a part of the Scheldt of as great depth and as accessible to ships of the line as the Thames at Woolwich. From Antwerp to the mouth of the Scheldt is a distance of about fifty miles. The first fortified town, on coming in from the sea, is Flushing, the batteries of which, though formidable, are not capable of preventing the passage of ships of war through a strait of three miles in width. Our armament, consisting of nearly forty sail of the line and thirty-eight thousand military, was the most powerful that had ever left our shores. It crossed the narrow sea with a fair wind; and, in the morning of the 30th of July, the inhabitants of the tranquil coast of Zealand were astonished by an unparalleled display of men of war and transports. Our troops landed and forthwith occupied Walcheren and the islands to the north. No resistance was offered except at Flushing; but our com-

mander, the Earl of Chatham, showed himself wholly in-

when he stopped to besiege that place. It ought only to George III. have been watched, whilst the main body of the troops should have landed in Dutch Flanders, on the south of the Scheldt, and marched straight to Antwerp, which, even with artillery, might have been reached in a few days. The French, never doubting the adoption of this plan, and conscious of their weakness, had moved their men of war up the river, beyond the town, previous to setting them on fire. But a delay of a fortnight took place before Flushing, and time was thus given to the enemy to strengthen the forts on the river, and to collect whatever force the country afforded. Still, as an attack by water was not indispensable to success, there yet remained a chance; ten days more, however, were lost; the relinquishment of the main object of the expedition became thus unavoidable; and the only further measure was to leave a body of fifteen thousand men in the island of Walcheren. There, accordingly, they remained during several months, suffering greatly from an unhealthy atmosphere, and doing nothing except destroying, on their departure, the dockyards of Flushing. Never was a gallant force more grossly misdirected; the choice of our general was as unaccountable as the choice of Mack in 1805; and the historian, were he to reason from the inferior numbers of the enemy, might pronounce this expedition as inglorious to our arms as the battles of Poitiers and Agincourt were to our enemies of a

The session of 1810 opened on the 28th of January, and the leading subject of debate was our unfortunate expedition to Walcheren and the Scheldt. A motion leading to inquiry was carried after a close division, namely, a hundred and ninety-five to a hundred and eighty-six; and the investigation was conducted chiefly at the bar of the House of Commons, a secret committee being appointed for the inspection of confidential papers. The Earl of Chatham, and other officers concerned in planning or conducting the expedition, were examined. The inquiry lasted several weeks, and disclosed, clearly enough, the imbecility of our commander; but the speeches of the opposition were pointed, not against the management of the expedition, but against its expediency as an enterprise; not against the general, but the cabinet. In this they were not seconded by the majority of the house. On the policy or impolicy of the expedition being put to the vote, the former was supported by two hundred and seventy-two in opposition to two hundred and thirty two; and even the less tenable ground of keeping our soldiers in an unhealthy island for three months after relinquishing all idea of an attempt on Antwerp, was vindicated by two hundred and fifty-three votes against two hundred and thirty-two; a decision too remarkable to be forgotten, and which has since stamped this with the name of the Walcheren Parliament. The only ministerial change consequent on the inquiry was the removal of Lord Chatham from his seat in the cabinet, and from the master-generalship of the ordnance; but this was in consequence of privately delivering a statement to the king, professing to vindicate himself at the expense of Sir Richard Strachan and the navy. The resolution adopted on this occasion was, " that the house saw with regret that any such communication as the narrative of Lord Chatham should have been made to his majesty, without any knowledge of the other ministers; that such conduct is highly reprehensible, and deserves the censure of the house.

The exclusion of strangers from the gallery of the house during the Walcheren inquiry gave rise to a discussion which, though at first unimportant, soon engaged much of the public attention. A Mr John Gale Jones, well known among the demagogues of the age, and at that

Reign of time president of a debating club, animadverted on the above twelve miles in breadth, having the sea on the Reign of George III. House of Commons in a handbill, in a style which induced the house to order his commitment to Newgate. A few weeks after, Sir Francis Burdett brought in a motion for his liberation, on the broad ground that the house had no right to inflict the punishment of imprisonment in such a case. Baffled in this way by a great majority, Sir Francis wrote and printed a letter to his constituents, denying this power, and applying contemptuous epithets to the houses. This imprudent step provoked a debate, which ended in a resolution by the House of Commons to commit Sir Francis to the Tower. The speaker issued his warrant, and the serjeant at arms carried it to the house of Sir Francis, but withdrew on a refusal of Sir Francis to obey. Next day the serjeant repeated his demand, accompanied by messengers; but the populace had by this time assembled in crowds near the baronet's house, and prevented his removal until an early hour on the 9th, when the civil officers burst into his house, put Sir Francis into a carriage, and conveyed him to the Tower in the midst of several regiments of horse. Sir Francis brought actions against the speaker and other officers; but they fell to the ground by non-suits, and he continued in confinement during the remainder of the session.

Among the further acts of this session were two which regarded Scotland; one for the increase of the smaller church livings, of which none in this part of the kingdom are now under L.150; the other relative to judicial prosion had been previously divided into chambers by an act passed in 1808; and the trial by jury in civil causes was introduced into Scotland by an act of 1815.

We turn with impatience from the banks of the Scheldt to a scene more honourable to our arms. Our troops under Sir Arthur Wellesley, now Lord Wellington, had passed the winter in the interior of Portugal, moving northward as spring advanced, but delaying active operations. Offensive war was unsuited to our situation, and the French awaited reinforcements from the north. Bonaparte's determination now was to make Massena penetrate into Portugal, and to expel those auxiliaries who were the mainspring of the obstinate resistance experienced by him in Spain. The first enterprise of the French army was the siege of the frontier fortress of Ciudad Rodrigo, which surrendered on the 10th of July. The next object of attack was the Portuguese fortress of Almeida, which was invested in the end of July, and taken unfortunately too soon, in consequence of the explosion of the magazine. Soon after, the French army, now a formidable body, advanced into Portugal, Lord Wellington retiring before them, but determined to embrace the first opportunity of fighting on favourable ground. This occurred when occupying the highest ridge of the mountain of Busaco, directly in face of the enemy. The French, always impetuous, and not yet aware of the firmness of our men. marched up the mountain; one division reached the top of the ridge, where they were immediately attacked by a corps of British and Portuguese, and driven from the ground. In other parts the same result took place before the French reached the top. The loss on our side was a thousand men, that of the enemy between two and three thousand. Massena desisted from further attacks; but turning the flank of our position by a mountain, Lord Wellington, instead of heading the enemy's columns as they debouched from the defile, retreated in the direction of Lisbon, till he reached the ground which he had previously determined to occupy at Torres Vedras, in order to cover that capital.

west and the Tagus on the east; the ground is extremely George III. mountainous, and accessible only by passes, which were occupied by our troops and by batteries. Massena felt all the strength of this position, and the repulse at Busaco made him beware of a second encounter on disadvantageous ground. It was now for the first time that the impetuous bands of Bonaparte stopped short in their career: the armies remained opposite to each other above four months, during which time the French were greatly straitened for provisions and forage, being obliged to get convoys of biscuit under escort from France, whilst the command of the sea secured abundance to the British. Still Massena persisted in keeping his position, hoping to combine his operations with the army of Soult, then advancing from the south-east of Spain; an army which was but too fortunate, having attacked and taken by surprise a Spanish camp on the banks of the Guadiana. A number of boats had been constructed by Massena to cross the Tagus and co-operate with Soult; but in the beginning of March intelligence arrived that a convoy of biscuit long expected from France had been intercepted by the Guerillas. There was now an end to all offensive projects, and there remained only the alternative of retreat. It began on the 5th of March; the British followed; and the movements of either army, during a very long march, afforded an admirable exemplification of the rules of war. Our advance was so rapid that the French were frequently obliged to ceedings, and reducing the heavy expenses caused by the compulsory extract of office papers. The court of sest their best troops in the rear, collected in solid bodies, and affording no opening to our vanguard. The retreat lasted a month, and closed near the fortress of Almeida, on the frontier of Spain. The French, however, were soon again in a condition to act. and advanced to relieve Almeida, of which we had now begun the siege. The chief fighting took place on the 3d and 5th of May, near a village called Fuentes de Honor, which was repeatedly taken and retaken; but all their efforts were ultimately ineffectual, and Almeida was left to its fate. The chief part of the garri son, however, found means to escape by a nocturnal march

1811

Meanwhile the south or rather the south-west of Spain was the scene of very active operations. A body of Spaniards and British, marching northward from Gibraltar, approached the south-western extremity of the line occupied by the French troops engaged in the blockade of Cadiz. General Graham commanded the British, and on 5th March, at noon, was drawing near to the close of a long march, when he received intelligence of the advance of a French force. Knowing the height of Barrosa, which he had just left, to be the key of the position, he immediately countermarched his corps, and had proceeded but a short way when he found himself unexpectedly near to the enemy, whose left division was seen ascending the hill of Barrosa, while their right stood on the plain within cannon-shot. To retreat was wholly unadvisable; an immediate attack was therefore determined on by General Graham, though unsupported by the Spaniards, and inferior to the enemy. A battery opened against the right division of the French caused them considerable loss, but they continued to advance until a charge with the bayonet drove them back with great slaughter. With the other division on the ascent of the hill there took place a similar conflict with a similar issue; both sides fought with courage, and both sustained a heavy loss; that of the British was above twelve hundred, and that of the enemy nearly double. The action lasted an hour and a half; our success was owing partly to the effect of our guns, but more to the firmness of the troops, who showed themselves determined rather to fall than yield.

About the same time, but at a distance of two hundred The track of country to the north of Lisbon is not miles to the north of Cadiz, the important fortress of Ba1811.

Regency dajos fell into the hands of the French. This painful intelligence reached Lord Wellington when following up the retreat of Massena; and no time was lost in detaching a hody of troops to the south of Portugal, to enable Marshal Beresford to advance and form the siege of Badajos. This called from the south the army of Soult, twenty-three thousand strong. On their approach Marshal Beresford raised the siege of Badajos, and prepared to meet the enemy with a force numerically superior, but of which only seven thousand consisted of British troops. Soult quitted Seville on the 10th May 1811, but Beresford remained in a state of two regiments of hussars, drew further down the river to uncertainty till the 12th, when he commenced raising the siege. On the 13th he held a conference with the Spanish at Valverde, where it was agreed to receive battle at the village of Albuera. The 14th was spent in a variety of movements; and in the morning of the 15th the British occupied the left of the position of Albuera, a ridge about four miles long, having the Aroya Val de Sevilla in rear, and the Albuera river in front. This position was now occupied by thirty thousand infantry, above two thousand cavalry, and thirty-eight pieces of artillery, eighteen of which were nine-pounders; but a brigade of the fourth division being still absent, the British infantry, "the pith and strength of the battle," did not amount to seven thousand. The French had fifty guns and above four thousand veteran cavalry, but only nineteen thousand chosen infantry; yet being of one nation, obedient to one discipline, and animated by one spirit, the excellence of their composition amply compensated for the inferiority of numbers. Soult examined Beresford's position on the evening of the 15th, and having learnt that the fourth division was left before Badajos, and that the corps of Spaniards under Blake would not arrive before the 17th, he resolved to attack the next morning. We shall now adorn our pages with the incomparable description of this conflict, given by the great historian of the peninsular war.

"The hill in the centre, commanding the Valverde road, was undoubtedly the key of the position if an attack was made parallel to the front; but the heights on the right presented a sort of table-land, trending backwards towards the Valverde road, and looking into the rear of the line of battle. Hence it was evident that, if a mass of troops could be placed there, they must be beaten, or the right wing of the allied army would be rolled up on the centre and pushed into the narrow ravine of the Aroya: the Valverde road could then be seized, the retreat cut, and the powerful cavalry of the French would complete the victory. Now the right of the allies and the left of the French approximated to each other, being only divided by a wooded hill, about cannon-shot distance from either, but separated from the allies by the Albuera, and from the French by a rivulet called the Feria. This height, neglected by Beresford, was ably made use of by Soult. During the night he placed behind it the artillery under General Ruty, the fifth corps under Girard, and the heavy dragoons under Latour Maubourg; thus concentrating fifteen thousand men and forty guns within ten minutes' march of Beresford's right wing, and yet that gesion as to the real plan of attack.

"The light cavalry, the division of the first corps under General Werlé, Godinot's brigade, and ten guns, still remained at the French marshal's disposal. These he formed in the woods extending along the banks of the Feria towards its confluence with the Albuera; and Godinot was ordered to attack the village and bridge, and to bear strongly against the centre of the position, with a view to attract Beresford's attention, to separate his wings, and to double up his right at the moment when the principal attack should be developed.

"During the night Blake and Cole arrived with above Regency. sixteen thousand men; but so defective was the occupation of the ground, that Soult had no change to make in his plans from this circumstance, and, a little before nine o'clock in the morning, Godinot's division issued from the woods in one heavy column of attack, preceded by ten guns. He was flanked by the light cavalry, and followed by Werle's division of reserve, and, making straight towards the bridge, commenced a sharp cannonade, attempting to force the passage; at the same time Briché, with observe Colonel Otway's horse.

"The allies' guns on the rising ground above the village answered the fire of the French, and ploughed through their columns, which were crowding without judgment towards the bridge, although the stream was passable above and below. But Beresford, observing that Werle's division did not follow closely, was soon convinced that the principal effort would be on the right, and therefore sent Blake orders to form a part of the first and all the second line of the Spanish army on the broad part of the hills, at right angles to their actual front. Then drawing the Portuguese infantry of the left wing to the centre, he sent one brigade down to support Alten, and directed General Hamilton to hold the remainder in columns of battalions, ready to move to any part of the field. The thirteenth dragoons were posted near the edge of the river, above the bridge; and, meanwhile, the second division marched to support Blake. The horse artillery, the heavy dragoons, and the fourth division, also took ground to the right, and were posted; the cavalry and guns on a small plain behind the Aroya, and the fourth division in an oblique line about half musket shot behind them. This done, Beresford galloped to Blake, for that general had refused to change his front, and, with great heat, told Colonel Hardinge, the bearer of the order, that the real attack was at the village and bridge. Beresford had sent again to entreat that he would obey, but this message was as fruitless as the former; and, when the marshal arrived, nothing had been done. The enemy's columns were, however, now beginning to appear on the right, and Blake, yielding to this evidence, proceeded to make the evolution, yet with such pedantic slowness, that Beresford, impatient of his folly, took the direction in person.

"Great was the confusion and the delay thus occasioned, and ere the troops could be put in order the French were amongst them. For scarcely had Godinot engaged Alten's brigade, when Werlé, leaving only a battalion of grenadiers and some squadrons to watch the thirteenth dragoons and to connect the attacks, countermarched with the remainder of his division, and rapidly gained the rear of the fifth corps as it was mounting the hills on the right of the allies. At the same time the mass of light cavalry suddenly quitted Godinot's column, and crossing the river Albuera above the bridge, ascended the left bank at a gallop, and, sweeping round the rear of the fifth corps, joined Latour Maubourg, who was already in face of Lumley's squadrons. Thus half an hour had sufficed to render neral could neither see a man nor draw a sound conclu- Beresford's position nearly desperate. Two thirds of the French were in a compact order of battle on a line perpendicular to his right, and his army, disordered and composed of different nations, was still in the difficult act of changing its front. It was in vain that he endeavoured to form the Spanish line sufficiently in advance to give room for the second division to support it; the French guns opened, their infantry threw out a heavy musketry, and their cavalry, outflanking the front and charging here and there, put the Spaniards in disorder at all points; in a short time the latter gave way, and Soult, thinking the whole army was yielding, pushed forward his columns,

Regency. while his reserves also mounted the hill, and General Ruty third were standing in any. Ammunition failed, and, as Regency.

placed all the batteries in position.

"At this critical moment General William Stewart arrived at the foot of the height with Colonel Colborne's brigade, which formed the head of the second division. The colonel, seeing the confusion above, desired to form in order of battle previous to mounting the ascent; but Stewart, whose boiling courage overlaid his judgment, led up without any delay in column of companies, and attempted to open out his line in succession as the battalions arrived at the summit. Being under a destructive fire, the foremost charged to gain room; but a heavy rain prevented any object from being distinctly seen, and four regiments of hussars and lancers, which had passed the right flank in the obscurity, came galloping in upon the rear of the line at the instant of its development, and slew or took two thirds of the brigade. One battalion only (the thirty-first) being still in column, escaped the storm and maintained its ground; while the French horsemen, riding violently over every thing else, penetrated to all parts. In the tumult a lancer fell upon Beresford, but the marshal, a man of great strength, putting his spear aside, cast him from his saddle; and a shift of wind blowing aside the mist and smoke, the mischief was perceived from the plains by General Lumley, who sent four squadrons out upon the lancers and cut many of them off.

"During this first unhappy effort of the second division, so great was the confusion, that the Spanish line continued to fire without cessation, although the British were before them; whereupon Beresford, finding his exhortations to advance fruitless, seized an ensign and bore him and his colours by main force to the front; yet the troops would not follow, and the man went back again on being released. In this crisis the weather, which had ruined Colborne's brigade, also prevented Soult from seeing the whole extent of the field of battle, and he still kept his heavy columns together. His cavalry, indeed, began to hem in that of the allies; but the fire of the horse artillery enabled Lumley, covered as he was by the bed of the Aroya, and supported by the fourth division, to check them on the plain, while Colborne still maintained the heights with the thirty-first regiment; the British artillery, under Major Dickson, was likewise coming fast into action, and William Stewart, who had escaped the charge of the lancers, was again mounting the hill with General Houghton's brigade, which he brought on with the same vehemence, but, instructed by his previous misfortune, in a juster order of battle. The weather now cleared, and a dreadful fire, poured into the thickest of the French columns, convinced Soult that the day was yet to be won.

"Houghton's regiments soon got footing on the summit, Dickson placed the artillery in line, the remaining brigade of the second division came up on the left, and two Spanish corps at last moved forward. The enemy's infantry then recoiled, yet soon recovering, renewed the fight with greater violence than before; the cannon on both sides discharged showers of grape at half range, and the peals of musketry were incessant and often within pistol shot; but the close formation of the French embarrassed their battle, and the British line would not yield them one inch of ground nor a moment of time to open their ranks. Their fighting was, however, fierce and dangerous. Stewart was twice hurt, Colonel Duckworth of the forty-eighth was slain, and the gallant Houghton, who had received many wounds without shrinking, fell and died in the act of cheer-Still the struggle continued with unabated fury. Colonel Inglis, twenty-two other officers, and more than four hundred men out of five hundred and seventy

the English fire slackened, the enemy established a column in advance upon the right flank; the play of Dickson's artillery checked them a moment, but again the Polish lancers charging, captured six guns. And in this desperate crisis, Beresford, who had already withdrawn the thirteenth dragoons from the banks of the river, and brought Hamilton's Portuguese into a situation to cover a retrograde movement, wavered! destruction stared him in the face, his personal resources were exhausted, and the unhappy thought of a retreat rose in his agitated mind. Yet no order to that effect was given, and it was urged by some about him that the day might still be redeemed with the fourth division. While he hesitated, Colonel Hardinge boldly ordered General Cole to advance; and then riding to Colonel Abercrombie, who commanded the remaining brigade of the second division, directed him also to push forward into the fight. The die being thus cast, Beresford acquiesced, and this terrible battle was con-

"The fourth division had only two brigades in the field; the one Portuguese under General Harvey; the other, commanded by Sir W. Myers, and composed of the seventh and twenty-third British regiments, was called the fuzileer brigade. General Cole directed the Portuguese to move between Lumley's dragoons and the hill, where they were immediately charged by some of the French horsemen, but beat them off with great loss: meanwhile he led

the fuzileers in person up the height.

"At this time six guns were in the enemy's possession, the whole of Werle's reserves were coming forward to reinforce the front column of the French, and the remnant of Houghton's brigade could no longer maintain its ground; the field was heaped with carcasses, the lancers were riding furiously about the captured artillery on the upper part of the hill, and on the lower slopes a Spanish and an English regiment in mutual error were exchanging volleys; behind all, General Hamilton's Portuguese, in withdrawing from the heights above the bridge, appeared to be in retreat. The conduct of a few brave men soon changed this state of affairs. Colonel Robert Arbuthnot, pushing between the double fire of the mistaken troops, arrested that mischief; while Cole, with the fuzileers, flanked by a battalion of the Lusitanian legion under Colonel Hawkshawe, mounted the hill, dispersed the lancers, recovered the captured guns, and appeared on the right of Houghton's brigade exactly as Abercrombie passed it on the left.

"Such a gallant line, issuing from the midst of the smoke, and rapidly separating itself from the confused and broken multitude, startled the enemy's heavy masses, which were increasing and pressing onwards as to an assured victory; they wavered, hesitated, and then vomiting forth a storm of fire, hastily endeavoured to enlarge their front, while a fearful discharge of grape from all their artillery whistled through the British ranks. Myers was killed; Cole, and the three colonels, Ellis, Blakeney, and Hawkshawe, fell wounded; and the fuzileer battalions, struck by the iron tempest, reeled and staggered like sinking ships. Suddenly and sternly recovering, they closed on their terrible enemies; and then was seen with what a strength and majesty the British soldier fights. In vain did Soult, by voice and gesture, animate his Frenchmen; in vain did the hardiest veterans, extricating themselves from the crowded columns, sacrifice their lives to gain time for the mass to open out on such a fair field; in vain did the mass itself bear up, and fiercely striving, fire indiscriminately upon friends and foes, while the horsemen hovering on that had mounted the hill, fell in the fifty-seventh alone, the flank threatened to charge the advancing line. Nothing and the other regiments were scarcely better off; not one could stop that astonishing infantry. No sudden burst of

Regency. undisciplined valour, no nervous enthusiasm, weakened the him without restriction was supported by two hundred Regency. stability of their order; their flashing eyes were bent on the dark columns in their front; their measured tread shook the ground; their dreadful volleys swept away the head of every formation; their deafening shouts overpowered the dissonant cries that broke from all parts of the tumultuous crowd, as foot by foot and with a horrid carnage it was driven by the incessant vigour of the attack to the farthest edge of the hill. In vain did the French reserves, joining with the struggling multitude, endeavour to sustain the fight; their efforts only increased the irremediable confusion, and the mighty mass giving way like a loosened cliff, went headlong down the as-The rain flowed after in streams discoloured with of six thousand unconquerable British soldiers, stood triumphant on the fatal hill!"

Lord Wellington reached the army some time after the battle of Albuera, and determined to renew the siege of Badajos. Breaches were made in the walls, and two attempts at assault were hazarded (6th and 9th June), but in vain; the advance of the French army from the north, in concert with that of the south, necessitated the raising of the siege. Here ended the active operations of the year. Our army remained some time encamped in the central part of Portugal, after which Lord Wellington marched northward and threatened Ciudad Rodrigo, but retreated before a superior force collected by the French.

The session of 1810-11 opened in November 1810, more early than was intended, in consequence of the mental indisposition of the king. Repeated adjournments, however, took place in the vain hope of a recovery, and it was not till the 20th of December that resolutions for a regency were moved in both houses. They formed the chief subject of discussion during the ensuing month. Their principal characteristics consisted in the restrictions imposed on the prince for the succeeding year, during which he was not permitted to confer the rank of peer, to grant an office in reversion, or even a place or pension, except during the king's pleasure; whilst the management of the royal household was vested in the queen. Resolutions so obnoxious to the prince called forth a strong opposition; and right were both driven from the field. The darkness and a motion that the royal power should be conferred on prevented our making prisoners, but a body of cavalry join-

against two hundred and twenty-four. But the divisions in favour of ministers became stronger after the question of the regency was settled, and great part of the session passed without any contest between government and the opposition, the latter considering the present arrangement as temporary; an opinion in which they were confirmed by the language of the regent, who entered on his functions by declaring, that he continued ministers in office solely from a feeling of filial respect. Among the successive topics of discussion were the county meetings of the Catholics in Ireland, and the steps taken by government to repress them; an act to authorize government to send English militia into Ireland, and Irish militia into England; blood, and fifteen hundred unwounded men, the remnant and finally, the re-appointment of the Duke of York to his office of commander-in-chief; a step which excited some surprise, but received the decided support of parliament, a motion made to censure it being negatived by two hundred and forty-nine to forty-seven. But the most anxious topics of parliamentary and public attention were the distress of trade and the state of our paper currency. Towards the relief of the former, an issue of exchequer bills was authorized under certain limitations; and to support

the credit of the latter, a law was passed which, when join-

ed to former enactments, had nearly the effect of making

bank-notes a legal tender.

The campaign of 1812 commenced very early, Lord Wellington investing Ciudad Rodrigo on the 8th of January. The siege was pressed with activity, and a breach being made, the town was carried by storm on the 19th of January, though with a great loss, particularly in officers, among whom was General Mackinnon. So prompt had been our operations, that the French army approaching to the relief of the place would not at first believe the news of its capture. Soon afterwards Lord Wellington turned his forces to the south, and invested Badajos, already the scene of such obstinate contests. Here, also, the operations were pressed with great rapidity, that they might be brought to an issue before the arrival of the French army from Cadiz. On the night of the 6th April, Badajos was attacked on several points by escalade; but we were repulsed in every direction except at the castle, which was fortunately carried; and as it commanded all the works, the consequence was the surrender of the town next day, after a siege which, short as it had been, cost us very nearly five thousand men. Secure on the south, Lord Wellington now marched towards the north, and detached Sir Rowland Hill to make a sudden attack on the French station at Almaraz, where the bridge over the Tagus served as the chief military communication between the northern and southern army. The expedition was successful, the entrenchments being stormed and destroyed. Lord Wellington now marched against the French army in the north, commanded by Marmont, and reached Salamanca on the 16th of June. The forts in that town being taken after some sharp fighting, the French retreated to the Douro: but being soon reinforced, resumed the offensive, and obliged our army to retreat in its turn. These movements continued several weeks, Lord Wellington being obliged to yield ground to his opponent, but ready to attack him on the commission of any material fault. Such an opportunity at last occurred on 22d July, near Salamanca, when the French, rendered confident by our continued retreat, extended their left, and presented an opening, which was instantly seized by their vigilant adversary. Columns were sent forward against the enemy's left and centre; the former succeeded completely, the latter met with much opposition. Great gallantry was shown, and heavy loss sustained on both sides. At last the French centre

Regency. ing in the night, the hostile rear-guard was attacked next namely, the claims of the Irish Catholics, the orders in coun-Regency three thousand British and two thousand Portuguese; that of the enemy in killed and wounded was at least equal, and we took between six and seven thousand prisoners. The British force in the field was twenty-two thousand.

The consequences of the victory of Salamanca were the pursuit of the French army; the occupation of Madrid on the 12th of August by the allies; the abandonment by the French of the works constructed at vast expense against south of Spain. But as this loss of territory was not attended by a loss of troops, it became incumbent on Lord Wellington to prepare against a vigorous attack from forces that were rapidly concentrating. He made repeated attempts to take the castle of Burgos, and the military stores collected there; but this fort, defended by a strong garrison and a vigilant commander, General Dubreton, baffled all our efforts, and proved the cause of a considerable sacrifice of lives. Meantime the approach of Soult from the south, and of the army that had fought at Salamanca from the east, obliged Lord Wellington to adopt the alternative of retreat. He began his march on the 20th of October, and proceeded westward, in a line nearly parallel to the Douro, taking above three weeks to recross the country to the scene of his victory at Salamanca. There, united with General Hill, and at the head of fifty thousand men, he remained on ground lately so propitious, hoping that an opportunity might offer to attack the enemy, though now increased, by the junction of their two armies, to the number of seventy thousand. But Soult's positions were found too strong for attack, and the interval afforded him by Lord Wellington was diligently employed in pushing forward detachments to cut off our communications with Portugal. Retreat now became indispensable; and here, amidst hasty marches, and a scarcity of five days, there occurred scenes of insubordination which recalled all the disorders of our march to Corunna, and drew from Lord Wellington a most severe censure in general orders. Fortunately, similar privations on the side of the French prevented them from making many prisoners, and, on 20th November, on the frontier of Portugal, was closed this eventful campaign.

The session opened on the 7th of January, and the early discussions related to arrangements for the royal household, and to a motion by Mr Brougham to exclude the droits of admiralty from the civil list. In this he was unsuccessful; and a similar fate attended a motion by Lord Morpeth, for an inquiry into the state of Ireland, with a view to admitting Catholics to the enjoyment of political rights. The next measures of general interest were two acts against framebreaking; a practice which the Nottingham workmen, pressed by the loss of the American market, and the consequent fall of wages, had carried to an alarming length. The public attention was soon after engaged by ministerial changes. Marquis Wellesley finding himself unable to lead the cabinet, or to prevail on his colleagues to extend the scale of our operations in Spain, resigned in February the secretaryship of foreign affairs, and was succeeded by Lord Castlereagh. The restrictions on the power of the regent now drawing to a close, consistency required an overture for the admission into office of the leaders of the opposition, intimate as they had been in former years with his royal highness. This prompted the well-known letter of the 13th February from the prince to the Duke of York, professing a wish to unite with the present ministers "some of those persons with whom the early habits of his public life had been formed." The answer of Lords Grey and Grenville explained their reasons for declining a union with an administration differing so much from them in the most important points of national policy,

morning, and obliged to surrender. Our loss was about cil, and the over-issue of bank paper. With this explanation the correspondence closed, and the ministry proceeded unchanged until the assassination of Mr Perceval, when Lord Liverpool succeeded to the first station, and was directed by the prince to make an overture to Marquis Wellesley and Mr Canning. This led to nothing; and a motion made in the House of Commons to address the regent, praying him to appoint an efficient administration, was carried by a hundred and seventy-four against a hundred and Cadiz: the evacuation of Andalusia, Grenada, and all the seventy. This most unexpected vote necessitated a second overture to the opposition, the management of which was committed, first to the Marquis of Wellesley, and afterwards to Lord Moira. It now seemed highly probable that the opposition would come in; yet the negociation entirely failed, in consequence partly of existing animosities, partly of the stiffness of Lord Grey, partly, perhaps, of a secret reluctance in the court to admit the opposition. Lords Liverpool and Castlereagh remained in office with all the benefit of a declared readiness on their part, and of an apparent unreasonableness in the demands of opposition.

> The most urgent question now before parliament was the continuation or repeal of the orders in council. The distress of the manufacturers had become general, and had led, among the lower orders, to commotion and riot; among the higher, to petitions to parliament complaining of our pertinacious adherence to these orders as the cause of the loss of the great market of the United States. An inquiry was instituted on the motion of Mr Brougham. It was conducted by him with astonishing knowledge and talent during several weeks, and every step in its progress gave the evidence a more serious aspect. Still there was a prevailing disposition to cling to those measures, when the accession of Lord Liverpool to the leading station in the cabinet produced their repeal, though unfortunately too late to prevent the American war.

Though parliament had sat during five years only, the victory of Salamanca and our other successes in Spain afforded ministry a favourable opportunity for appealing to the people. A dissolution was proclaimed on the 29th of September; and on the 30th of November the new parliament was opened by the regent in person, who spoke for the first time from the throne. Our partial reverses in the close of the campaign in Spain, and the murmurs of Marquis Wellesley and Mr Canning at the inadequacy of our financial contributions to the peninsular contest, were silenced by the cheering intelligence from Russia, from which Bonaparte was now retreating with tremendous loss. In the progress of the session the attention of the house and of the public was strongly excited by an appeal from the Princess of Wales to parliament, demanding an investigation of her conduct. This led to a motion for a copy of the report delivered by the noblemen charged with the inquiry of 1806; and this motion being negatived, the result was the publication in the newspapers of a succession of papers relating the whole transaction. These papers, however indicative of want of discretion on the part of her royal highness, produced, on the whole, an impression in her favour, as unjustly attacked in her honour. The most interesting debates of the session related to the Catholic question, and the renewal, with important changes, of the charter of the East India Company. The new charter, granted for twenty years from 1814, reserved to the Company the exclusive trade to China, but laid open to the public, with slight qualifications, the trade to all other parts of the East. Among the minor proceedings of the session were an act for lessening the endless delays of chancery, by appointing a vice-chancellor; and an act, which, if it did not enforce clerical residence, held out a strong inducement to it, by obliging incumbents to increase

liberal vote of credit, parliament was prorogued on the 22d of July, amidst a general hope of favourable intelligence from the Continent; Spain being nearly delivered from the invaders, and the Germans having risen with ardour to as-

sert their independence.

The campaign of 1813 opened in the east of Spain, by an attack on the allied army under Sir John Murray, stationed not far from Alicant. The ground it occupied was strong, but the length of the position, two miles and a half, made Suchet, who commanded the French, conceive the hope of penetrating it at one point or another. In this, however, he was foiled with a loss of from two to three thousand men; this being the only check of importance received by that commander in all his campaigns in Spain. Soon after this success, our army was engaged in the bold plan of proceeding by sea to Catalonia, and besieging Tarragona. The wind proved favourable; the main body was landed near Tarragona; and a detachment succeeded, by great exertion, in taking Fort St Philip on the mountain called the Col de Balaguer, which blocked the nearest road for the arrival of the French from the south. Suchet, however, lost no time in marching northwards; and our general, Sir John Murray, considered his force, which was chiefly Spanish, as unable to withstand the French. He therefore embarked and returned to Alicant, a measure which incurred censure, but appears fully justified by circumstances, and still more by the conduct of his successors in the command.

Suchet, though successful on this occasion, soon found himself unable to retain his extensive line of occupation. The battle of Vittoria brought a new enemy on his rear, and obliged him to withdraw, first from Valencia, and subsequently as far as Barcelona. Our army now advanced by land, and resumed the siege of Tarragona, with the power of retreating, not, as before, by sea, but on the country behind; an alternative to which a second advance by Suchet soon compelled our new commander, Lord William Bentinck. The French, however, unable to occupy an extended position, blew up the works of Tarragona and retired. Our army advanced anew, but was again checked and obliged to draw back, exhibiting a striking proof of the impracticability of opposing an active enemy with a mixed force, of which the Spaniards formed a large pro-

We now turn to the western part of the peninsula, the field of the commander-in-chief, and of the far larger portion of our force. Lord Wellington, averse to open the campaign till every part of his troops was ready to co-operate with efficiency, did not move from quarters till after the middle of May. He knew that he would have much ground to traverse, retreat being evidently the policy of the French, weakened as they were by the recall of twenty-five thousand veterans, who had been feebly replaced by a body of conscripts. Lord Wellington was now, for the first time, at the head of a superior force, which he wielded with consummate skill. The strength of the enemy lay in the line of the Douro, which they expected to defend with advantage, so far at least as to make us purchase dearly its acquisition; but all this was prevented by Lord Wellington making his left division cross the river on the Portuguese territory, and advance along its northern bank; whilst he and Sir Rowland Hill, at the head of separate corps, marched, after several feints, in a diagonal direction, so as to support this movement, and effect a junction in an advanced position. The French, threatened with being taken in the rear, evacuated one town after another, and, even at Burgos, declined to fight on ground where late recollections would have been so animating; they continued to retreat, increasing from time to time their numbers by

Regency. the stipends of their curates. After granting ministers a the garrisons of the evacuated towns, until at last they took Regency. a position at Vittoria, a town in Biscay, near the north-east frontier of Spain.

The position of the French extended from north to south, and was of great length. Their left rested on heights; part of their centre also occupied heights, and their right was near the town of Vittoria. The Zadorra, a stream of considerable size, but crossed by several bridges, ran nearly parallel to their front. Both armies were numerous, particularly that of the allies. It was the first time that nearly forty thousand British had fought together in Spain. Lord Wellington acted on the offensive throughout, and began active operations by taking possession of the heights near the extreme left of the enemy. This was easily effected; but their importance being soon perceived by the French, a strong effort was made to recover them; and an obstinate contest took place, but the British on the heights repelled every assault. Under cover of these heights our right wing advanced and took a village (Sabijana) in front of the enemy's centre. It was in vain that the French attempted to retake this village. The centre of the allies crossed the river near it, and the centre of the French withdrew from their position, retreating to the town of Vittoria. At first this retreat was effected in good order; but an alarming account soon reached the French from their right. That part of their position had been defended by the river and two tetes-de-pont; but the troops of our left wing had taken, first the heights commanding these forts, and soon after the forts themselves, baffling every effort of the enemy to retake them. The great road leading to the north was thus in possession of the allies; hence general alarm and confusion spread throughout the French army. Their reserve was hastily withdrawn from its position, and pressed, with the whole army, along the only remaining road to the eastward; abandoning all their artillery, their ammunition, and their baggage. The loss of the battle was imputed by the French to Jourdan, whom Bonaparte, in a luckless hour, had allowed his brother to substitute for Soult, and who here, as at Talavera, was too late in discovering the importance of commanding positions. The loss in men was not particularly severe; that of the allies in killed and wounded was under four thousand, and that of the French probably not much greater. The temptation afforded by the plunder of the baggage prevented our troops from making many prisoners; but the spirit of the enemy was shaken, and the loss of their artillery and stores obliged them to retreat across the Pyrenees.

The next operation of consequence consisted in the siege of San Sebastian, a frontier fortress of great importance, which the French made the most vigorous efforts to relieve. Their army, provided anew with ammunition and cannon, advanced under the command of Marshal Soult, and, after some sharp actions, drove back the British corps posted in the passes of the Pyrenees. Our troops retreated to the vicinity of Pamplona, where, on the 27th, and still more on the 28th, they sustained a succession of impetuous attacks from the enemy. On the 29th Lord Wellington resumed the offensive, drove the French from their position, strong as it was, and obliged them to retrace their steps through the Pyrenees. Our loss in these actions was about six thousand men in killed and wounded; that of the enemy was still greater, exclusive of about four thousand prisoners.

At San Sebastian we had been repulsed in an assault on the 25th of July; the siege was continued, and a final assault, on the 31st of August, led to the capture of the place, though with the loss of two thousand five hundred men. The further operations were, the entrance of our army on the French territory on 7th October, the capitulation of Pamplona on the 26th, and a general attack on the position

which they retreated across the Nivelle. But this mountainous country afforded a number of positions, and our bated in both houses; and a motion relative to it, made in 1814. next task was to drive the enemy from behind the Nive, a large river flowing northward from the Pyrenees. This was partly accomplished on the 9th of December; but on several succeeding days the French, commanded by Soult, made impetuous attacks on the allied army, all anticipated by Lord Wellington, and all repulsed with heavy loss. Still the rains of the season, and the size of the mountain streams, retarded our operations. In January 1814 our army made some further progress, and, on the 25th of February, attacked the French in a position near Orthès, behind the Gave de Pau, another large river flowing from the Pyrenees. This attack was successful; and the retreat of the French was followed by the desertion of a number of their new levies. Soult's army now drew back, not in a northerly, but easterly direction, to join detachments from the army of Suchet in Catalonia. At Tarbes, on the 20th of March, the fighting was of short duration; but a sanguinary battle took place at Toulouse on the 10th of April; a battle attended with a loss to the allies of nearly five thousand men, which, as well as a great sacrifice of lives on the part of the French, might have been prevented had earlier intelligence arrived of the overthrow of Bonaparte, and the change of government at Paris.

The causes of this great change will be fully explained under another head. They are but partly to be found in the operations above described; for although the Spanish war had proved extremely injurious both to the finances and military establishment of Bonaparte, his power was so great, that nothing could have shaken it but a vast and sudden catastrophe. From the moment that he lost his armies in Russia, there existed substantial grounds for hope; and after the accession of Austria to the coalition, there was little reason to doubt his overthrow. The resources of France continued indeed unreservedly at his disposal; and the dread of a counter-revolution gave him the support of the majority of a nation long disgusted with his domineering spirit and never-ending wars. But the preponderance of military means was irresistible; in vain did he struggle against it in Saxony in 1813, and in Champagne in 1814. His partial successes served only to excite a temporary illusion; and the occupation of Paris by the allies proved, like its possession by successive parties in the revolution, decisive of the fate of France.

The cheering expectations with which parliament separated were happily realized in the course of the autumn; and parliament re-assembled on the 4th of November with the knowledge that the victory at Leipsic had secured the independence of Germany, and enabled our allies to shake the throne of the usurper. There was but one opinion, that at such a juncture every exertion, whether financial or military, should be made to complete the deliverance of the Continent. All the propositions of ministers were adopted; and on the 17th of November parliament adjourned to the 1st of March, evidently in the hope that before that period the advance of the allied arms into France would lead to a general pacification. This result, justified by sound calculation, was delayed by the precipitancy of the Prussians, and the consequent checks received by them and their allies; so that parliament, when it met on the 1st of March, adjourned to the 21st; and, on their assembling at that date, Lord Castlereagh being still absent on the Continent, the business transacted during several weeks was of inferior interest. Next came the discussions on the corn trade, the budget of the year, and an additional measure for the preservation of tranquillity in Ireland. A general pacification had by this time taken place; and the ar-

Regency. of the French near St Jean de Luz on 10th November, after version, except as to the compulsory transfer of Norway Regency. from Denmark to Sweden. That question was warmly dethe House of Lords by Earl Grey in a speech of uncommon eloquence, received the support of eighty-one votes against a hundred and fifteen. The further proceedings of the session were an address, praying the regent to interest himself with foreign powers for a prompt and general abolition of the slave-trade; a vote of L.400,000, in addition to the L.100,000 of the preceding year, to the Duke of Wellington; and grants, but on a far smaller scale, to Generals Graham, Hill, and Beresford, who were now raised to the peerage. On the Princess of Wales a settlement of L.35,000 was definitively made.

We have now arrived at the period when, after a contest which, as far as regards England and France, may be termed a war of twenty years, Europe was restored to a condition which promised long-continued peace. The principal provisions of the treaty of Paris in 1814, and the congress of Vienna in 1815, were as follow:-

France was circumscribed within her former territory, with the addition of part of Savoy, which, however, was relinquished in 1815 to the king of Sardinia.

Austria recovered Lombardy, and added to it Venice with its adjacent territory, possessing thus a population of twenty-nine millions, being very nearly equal to that of France, and considerably greater than that which she possessed in 1792.

Germany was declared a great federal body, as before the French revolution, with the distinction that a number of petty districts and principalities were incorporated into the larger, such as Bavaria, Wirtemberg, Hesse-Cassel, and Hesse-Darmstadt; and with the further distinction, that there is now no imperial head, but an understood division of influence between the two great powers, Austria being the protectrix of the south, and Prussia of the north. These are progressive advances towards consolidation; and to them may be added the formation of a diet, still devoid of unity and slow in deliberation, but not altogether so tardy or disunited as its predecessors at Ratisbon.

Russia has during the present age suffered no reduction of her territory, but has proceeded in a regular course of acquisition. Her power, though less colossal than is vulgarly supposed, has received a substantial addition by the acquisition of Finland and of the greater part of Poland. Two thirds of what once was Prussian Poland, and a part of Galicia, were formed in 1815 into a kingdom, which, however, has recently been overthrown.

Prussia, on the other hand, has exhibited a striking example of the mutability of political greatness. Raised by the talents of Frederick II. to a rank above her real strength, but making after his death successive additions to her territory by the dread of her arms, and by diplomatic combinations, she saw the whole fabric overturned by Bonaparte in one fatal campaign. From 1807 to 1813 her dominions continued circumscribed, and her population hardly exceeded six millions. But the arrangements of 1814 restored to her a third of Russian Poland, and a valuable tract of country on the Lower Rhine; and her population is now above ten millions.

Of her colonial conquests from France, England retained Tobago, St Lucie, and the Isle of France. The peace confirmed also our possession of Malta and the Cape. Of the other Dutch settlements, Surinam and Java were restored; but Demerara, Berbice, and Essequibo, containing a number of British settlers, were retained; the merchants of Holland, however, enjoying certain privileges of trade with these colonies. On the continent of Europe we effected a long-desired, though (as the event has shown) rangements of ministers afforded little opening for animad- insecure measure, the union of the seven Dutch and ten

detached state, presented too tempting an object for France,

and would have proved the cause of repeated wars, in which England, from her interest in the independence of

participate.

The losses of Denmark rank among the most painful consequences of the wars of the French revolution. To strip that pacific and inoffensive kingdom, first of its navy, and next of a kindred country, governed by the same sovereign during four hundred years, were acts that called forth the regret and condemnation of every unprejudiced observer. The transfer of Norway was opposed by the inhabitants; and we add with regret, that our navy was ordered to take part against them by blockading their ports. At last the affair was terminated by a convention pronouncing the union of Sweden and Norway under the same sovereign, but reserving to the latter her separate constitution. Pomerania was transferred from Sweden to Prussia, and Denmark received a small territory to the south of Holstein.

Sweden had enjoyed during many years the advantage of neutrality, and, like Denmark, increased gradually her shipping and trade. Deviating from this in 1805, and becoming a party to the coalition against France, she was saved from hostilities by the rapid overthrow of Austria; and Pomerania was not attacked until 1807, when Gustavus IV. chose to refuse peace at the time when he had not the support of a single continental ally. This and other acts of madness led to his deposition in 1809; and the year after, Europe saw with surprise the nomination of Bernadotte as the efficient head of the Swedish government. This choice, attributed at first to the interference of Bonaparte, was due, it seems, to the personal exertions of Bernadotte himself. The acquisition of Norway, and the introduction into Sweden of various improvements by an active-minded foreigner, are advantages of magnitude, and calculated to form some counterpoise to the loss of Finland and the increased danger from Russia.

Spain and Portugal preserved their territory unaltered; both had received rude shocks from the invader, but in both the reign of superstition and indolence seemed so firmly fixed as to bid defiance to political change, whether introduced by mild or by harsh means. The events of 1820, however, have shown, that in Spain there exists that sense of the abusive nature of their institutions, and that desire of reform, which in France produced the revolution; while in Portugal, notwithstanding her degraded condition, results ultimately favourable may be expected from the natural course of events.

Switzerland, without being made a province of France, had been obliged to furnish a military contingent in the wars of Bonaparte. The arrangements of 1814 maintained her as a federal state, but with nineteen cantons instead of thirteen; an increase derived, not from extended territory, but from the independent form acquired by certain districts, such as the Pays de Vaud, incorporated formerly with the original cantons.

The king of Sardinia was restored to Piedmont, and his other continental possessions, with the addition of the territory of Genoa.

The country of all Europe most likely to profit by the occupancy of the French was Italy. The substitution of an efficient government for the feeble administrations of Naples and Rome, the diminution of superstition, the increase of industry, the extirpation of robbery on the high ways, and the new modelling of the military establishment, were all objects of the highest importance. To these was added a hope of blending all the states of the peninsula into a common union; a union most ardently desired by

Regency. Belgic provinces into one kingdom. The latter, in their the Italian nation, and calculated, above all things, to pre- Regency. serve their country from war and the intrusion of foreigners. The selfish policy of Bonaparte, whose object was merely to extract from every country the utmost possible supply Holland, and her dread of invasion, could hardly fail to of revenue and recruits, prevented the adoption of this grand measure, until the re-assumed sway of foreigners, in particular of the Austrians, removed it to an indefinite distance, and reinstated the territorial divisions of Italy on the footing of 1792, with the exception of the republics of Venice and Genoa.

The royal family of Naples remained in Sicily during 1814; but Murat was not recognised by the Bourbons, and dreaded, with reason, that the allies would deem their task incomplete if they did not restore the crown of Naples to the ancient family. He armed in self-defence, and no sooner did he hear of Bonaparte's entrance into Lyons, than he advanced against Lombardy, and called upon all the Italians to unite in the assertion of their national independence. But his troops were unable to cope with the Austrians; after some partial successes they were obliged to retreat; and finding, in some sharp actions on their own territory, the continued superiority of their opponents, the eventual result was, the dispersion of the Neapolitan army, and the surrender of their capital on the 22d of May. The royal family now returned from Palermo to Naples, and resumed their sovereignty. Murat then escaped to Toulon; but, after the second return of the Bourbons, he proceeded to Corsica, and conceived the wild project of landing in the Neapolitan territory at the head of a feeble detachment, in the hope of being joined, like Bonaparte on returning from Elba, by thousands of his ancient followers. He disembarked in Calabria, but was forthwith attacked by the inhabitants, taken, and shot by order of the royal family, who were thus left in undisturbed possession of the crown.

Turkey was no party to the treaty of 1814, but remained on the footing on which the treaty with Russia in 1812 had placed her. Stationary in an age of change, and inflexible in her adherence to traditionary usages, she saw the French revolution pass without sustaining any injury from it; or rather she was indebted to it for a relaxation in the shocks to which the European part of her empire is exposed from Austria and Russia. The peace of 1790 had been preserved uninterrupted by Austria; that of 1791 was infringed by Russia by only one war, viz. from 1807 to 1812. The temporary occupation of Egypt by the French, and the more permanent establishment of England in the Ionian Islands, have had no effect on the interior of the Turkish empire.

We must now proceed to record military operations conducted in a very different quarter, and involving considerations very distinct from those which animated the contest on the continent of Europe. The United States of America continued on friendly terms with us during several years after the beginning of the war of 1803. There existed discussions, and of rather a serious nature, between the two countries, particularly in regard to the practice of our naval officers of impressing American seamen on suspicion, or pretended suspicion, of their being British subjects; but these contests were happily confined to diplomatists. Meantime the navigation of the Americans was in a course of rapid extension; for their neutral flag enabled them to act as carriers to the continental belligerents, and, in particular, to convey to Europe the produce of the French and Spanish West Indies. The depression of our West India trade in 1805, though the unavoidable result of too great a growth of produce for a system of monopoly, was attributed to the successful rivalship of the Americans in the continental markets. Mr Pitt was assailed by our ship-owners, and prevailed on to take measures which obliged the Americans to forbear the direct passage

character by carrying them in the first instance to their own ports. The Grenville ministry maintained what Mr Pitt had done, and went no farther; but they were succeeded by men actuated by different views. A parliamentary committee, appointed in June 1807 to inquire into the distress of our West India colonies, received evidence calculated to strengthen an impression already very general, that a total stop ought to be put to the conveyance of French or Spanish colonial produce in neutral bottoms. No sooner did the successful termination of the Copenhagen expedition give popularity to the system of vigour than we issued the orders in council of November 1807, the object of which, however disguised, was to put a stop to neutral traffic, except when carried on by license from our government; thus assuming the power of restricting or extending that traffic as we should find beneficial to our interest, or rather, as we should imagine to be beneficial, since, in questions of commerce, the real is frequently far different from the anticipated result.

In this explanation of these ill-understood orders, we exclude from the motives of ministers all participation in four hundred and seventy-eight. Even the Java, though that jealousy of America which actuated so many of our a large frigate, had only three hundred and sixty-seven countrymen. We consider them as acting from conviction, men, her opponent four hundred and eighty. The inequaas seeking in this measure only a source of benefit to our lity in weight of metal was still greater, each of these Amecommerce, and of annoyance to our enemies in Europe; rican frigates having been originally intended for a ship of yet, even with these qualifications, the orders in council have contributed more than any other measure in the present age to the distress which afterwards afflicted our coun- 1st 1813, than the superiority was found to rest with us. try. Their first practical result was a suspension of the navigation of the Americans by a general embargo im- the Americans, and directed to the conquest of Canada, posed by their own government; and this preliminary mea- of which the frontier adjoins their northern states, extendsure was in a few months succeeded by a non-intercourse ing in a long line from south-west to north-east. The act, which continued in operation above a year, during boundary consists in a great measure of water, being formwhich our exports to America were greatly reduced, and our manufacturers distressed to a degree that ought to by the course of the St Lawrence. On the south-west have served as a warning of the consequences of a further part of this frontier a body of two thousand three hundred contest with our best customers. In 1809, in consequence Americans, regulars and militia, advanced in July 1812 of a temporary arrangement, the intercourse was resumed, from the small fort of Detroit. Their operations, at first and exports from England to America took place to a great successful, were soon checked by a British detachment; amount. But the offensive part of our system was soon retreat became unavoidable, and our troops assuming the afterwards revived; the Americans were prevented from offensive in their turn, the result was the surrender, on the trading with France, Italy, or Holland, and the only con-ciliatory answer given by our government, was a promise the fort of Detroit. Not discouraged by this failure, ano-to recall our orders in council whenever the Americans ther detachment of Americans assembled near Niagara; should obtain from Bonaparte the repeal of his Berlin and but, after a sharp action on the 13th of October, were Milan decrees. This repeal was in some measure obtain- obliged, like their countrymen, to surrender. A further ed in 1810, but nothing could wean our ministry from their attempt, on the part of the Americans, to force the Niapredilection for what they accounted a grand political mea-gara frontier on the 28th November was likewise unsucsure; and those who inspect the official communications of cessful; whilst, in a different quarter, at a distance of nearthe two governments, will see with surprise the expedients ly three hundred miles to the north-east, the advance of devised, and the promises held out, to gain time and to their main body to Champlain proved ineffectual, the predelude the Americans, while, in fact, there never was an parations on our side necessitating their retreat. Lastly, intention of recalling the obnoxious decrees. The Ameria a detachment advancing, in January 1813, in the hope of cans offered explicitly to recall all hostile edicts "if we retaking Fort Detroit, were themselves attacked by a Brirevoked our orders;" but this not being complied with, tish division, and obliged to surrender. their ports were definitively shut against us, and our manufacturers reduced to great distress; a distress pourtrayed activity or courage, but of impatience and insubordination, in colours unfortunately too impressive in the parliamen- the restraint of discipline being ill suited to a nation that tary papers on the orders in council, printed in the early part of 1812. But no change could be effected in our measures till the accession of Lord Liverpool to the first ministerial station, when a repeal took place, but un happily too late, the Americans having declared war before this intelligence could reach them. From this time forward the impartial narrator finds it his duty to transfer the different quarter, on the Miami, a river falling into Lake

Regency across the Atlantic, and to give such cargoes a neutral now a minister aware of the evil tendency of our orders in Regency council, and prepared to make reasonable concessions to the Americans; whilst they, heated by the contest, and 1814. attributing the change to the dread of losing Canada, refused our offers of accommodation.

The naval conflicts in the first year of the war were of a nature greatly to surprise the public, accustomed as it was to our almost uninterrupted triumphs at sea. The Guerrière frigate was captured on 19th August 1812, by the Constitution American frigate; and the Macedonian on the 25th of October by another American frigate called the United States. If these losses could in any degree be attributed to the fault of our officers, no such charge could be brought in the case of Captain Lambert of the Java, a brave and intelligent commander, who, after a dreadful conflict, was obliged, on the 29th of December, to strike to the Constitution. In this, as in the preceding actions, the real cause of failure lay in the disproportion of strength; the Guerrière having only two hundred and sixty-three men, her antagonist four hundred and seventysix; the Macedonian only three hundred, the United States the line. No sooner did the two nations meet on an equal footing, in the case of the Chesapeake and Shannon, June

The operations by land were offensive on the part of ed partly by the immense lakes Erie and Ontario, partly

These repeated failures were the result, not of a deficient acknowledges no master. But, in the next campaign, the Americans took the field with augmented forces and an improved plan of action. A strong division crossing Lake Ontario, landed on the 27th April at York, the chief town of Upper Canada, and took it, with its stores and part of the garrison. A check was indeed given to them in a very charge of aggression from England to America. We had Erie; but next month a strong body of Americans pene-

Regency. trated the Niagara frontier; and an attempt made by the ing up the Patuxent, destroying a flotilla in that river, and Regency. British on Sackett's harbour, a port in Lake Ontario, fail- landing a military force under Major-General Ross, which ed through the misconduct of the general. Still the progress of the American main body into Canada from the ington, drove them from their ground, and entered the Niagara was obstructed, and checks experienced by them capital in the evening. Here private property was rein a way that clearly demonstrated the inexperience of spected; but of the public buildings there were destroyed their troops. They forbore, therefore, to advance by land, not only the arsenal, the dock-yard, and the war office, but and directed their efforts to a naval superiority. On Lake Erie, the more remote of the two from our Canada settlements, this superiority was acquired in September, after the capture of our petty squadron under Captain Barclay; and the consequence was our abandoning the more distant posts in Upper Canada. On Lake Ontario the naval contest was long maintained; and an attempt made, in November, by a strong division of Americans, to descend the St Lawrence in small craft, and to threaten Montreal, was rendered abortive by the activity of our troops. The campaign was then closed by our opponents without making any serious impression on Canada, though their force exceeded twenty thousand men. On our part, the campaign terminated by taking Fort Niagara by surprise, and repulsing, near the small town of Buffalo, a corps of two thousand men brought forward to check our advance. The town was burned in retaliation for a similar excess committed by the Americans.

The inclemency of an American winter suspended hostile operations for some months. The first exploit of consequence in next campaign took place on Lake Ontario, and consisted in an attack by a British division and squadron on Fort Oswego, which, with its stores, fell into our hands. In the beginning of July an American division, five thousand strong, crossed the Niagara, already so often traversed, and obliged the opposing force to retreat. But the opportune arrival from Bourdeaux of some regiments which had served in France soon enabled our troops to make a stand; and on the 25th of July there took place an action more obstinate, and better sustained on the part of the Americans, than any that had yet occurred in the war. They were finally repulsed, but the loss was heavy on both sides. Some time after, a sally made by the garrison of Fort Erie against a detachment of British entrenched in the vicinity, though at first successful, was eventually repulsed. But a very different result attended an offensive enterprise, on a large scale, attempted by us on the side of Lake Champlain. For this purpose our commander, Sir G. Prevost, assembled all his disposable force, amounting, with the reinforcements from Europe, to nearly fifteen thousand men, crossed the American frontier, and marched southward to attack Plattsburgh, a fortified town on Lake Champlain. The attack on the land side was combined with that of a flotilla, consisting of a frigate and several smaller vessels, which, coming within sight on the 11th of September, engaged an American flotilla of nearly equal force. Unfortunately our commanding officer rights of neutral traffic, a topic so often urged among us. was killed, and our flotilla captured; a check which, to make a sudden retreat. This retreat, in the face of so inferior an enemy, was altogether inexplicable, and exthe operations on the side of Canada, each party having entirely relinquished the idea of offensive war.

Americans, our government had avoided offensive operations, and kept the command of our fleet in that station in the hands of Sir John Borlase Warren, an officer who

attacked the American division posted to defend Washthe houses of the senate and representative body, the residence of the president, and the bridge across the Potowmac. Our troops, being few in number, retreated soon

after; and embarking anew, proceeded against Baltimore, where they landed, drove the defending force of the Americans from their position, and approached the town. But the entrance to the harbour being closed by a barrier of sunk vessels, co-operation on the part of the navy was impracticable, and our troops were re-embarked without any loss of consequence, except that of their commander General Ross. A better result had been obtained in an expedition against Alexandria, a trading town on the Potowmac, whence a quantity of stores and shipping was brought away. Success also attended an expedition in a very different quarter, namely, in the river Penobscot, at the northern extremity of the United States, adjoining the British province of New Brunswick. Far different was the result of an expedition on a larger scale, directed against New Orleans. Our troops disembarked from the Mississippi, repelled an assault by the Americans, moved forward, and came within six miles of the town, where they found the enemy posted behind a canal, with a breast-work in front, and their right flanked by the Mississippi. After a fortnight passed in mutual preparations, a night attack was at last determined on; but, unexpected difficulties retarding it till day-light, the fire of the Americans from behind their breast-work was pointed with unerring aim, and proved extremely destructive. In the short space of twenty minutes, our three principal officers, and nearly two thousand privates, were killed or wounded; and though, on the opposite side of the river, our attack had been successful, it was determined to relinquish the expedition, and re-embark the troops. This distressing failure was poorly compensated by the capture of Fort Mobile, the last land operation of the war. At sea, our final exploit was the capture of the American frigate President, of fiftyfour guns and four hundred and ninety men. The peace was signed at Ghent, on the 24th of Decem-

ber 1814, and its terms afforded a curious exemplification of the futility of warlike struggles. The territorial possessions of both countries were, with a very trifling exception, left on the same footing as before the war; and not the slightest notice was taken of the questions which had most strongly excited the spirit of hostility on both sides,—neither of the impressment of seamen, a point so important to the Americans, nor of the limitation of the

The United States, in no respect a manufacturing counthough in itself of no great moment, induced our general try, purchased from us merchandise to an extent annually increasing, and which, in 1807, had reached the amount of L.12,000,000 sterling. Every addition to their capital, cited general surprise and disappointment. With it closed every year that they passed in peace and prosperity, increased their value to us in a commercial sense; while every blow given to their productive funds necessarily operated As long as there remained a hope of treating with the in diminution of their purchases and payments. But, far from acting on these impressions, the ministry of 1807 eagerly seized the opening given them by the violence of Bonaparte to assail the trade of America, and issued, in joined diplomatic to nautical habits. At last, however, it November, those orders which "prohibited all direct inbecame necessary to replace him by one whose spirit of tercourse from a neutral port to France, or her tributary enterprise was more conformable to the impatient ardour states, unless the neutral vessels intended for such voyages of our navy. Admiral Cochrane arrived, and lost no time touched first at a port in the British dominions, and paid a m concerting an attempt on the American capital, by sail- duty" This singular measure was vindicated, not as legal-

Regency. in itself, but as a trespass on neutral rights justified by the admissible when our own should he at or below eighty shil- Regency. previous trespasses of the French government. It would, it was argued, distress that part of the Continent subject to Bonaparte, and excite discontent against his government; but the real motive was to cramp and control the trade of neutrals. That the Americans would not submit to such humiliating conditions, our government was well aware; but it knew also that they had neither army nor navy, and would not, at least for several years, resort to the alternative of war. So far our calculation was correct; but the question of national advantage we entirely misconceived. For what was the practical operation of these restrictive edicts? The trade of the Americans with the Continent was suspended, and the remittances formerly made to us from the sale of their goods—remittances not overrated at four or five millions a year-were made no more. Our bank paper fell, more from that than from any other cause, into a discredit which occasioned a loss of twenty, thirty, and eventually nearly forty per cent. on all subsidies and other government expenditure on the Continent. The mercantile insolvencies in America which followed the orders in council recoiled, in a great degree, on England, whose exporting merchants were the chief creditors of the bankrupts. Next came the burdens and the havoc of war; and of every million of American capital thus diverted from productive industry, the half at least was lost to the British manufacturer. But this was not all; the suspended intercourse, and the subsequent appeal to arms, induced the Americans to attempt to manufacture for themselves. This for several years excluded our goods; and when, upon the return of peace, British merchandise was poured into the United States, at prices so low as to defy competition, the consequence, particularly in the year 1819, was a scene of general insolvency in the States, which once more recoiled with the most distressing effects on the British creditor. All this was the result of a policy bad in every point of view, and which neither had nor could have any decisive influence on the grand contest in Europe.

We now return from this necessary digression to the ordinary course of our narrative. Parliament assembled on the 18th November, and, after the transaction of some business, relative chiefly to keeping the English militia embodied, and preserving the peace of Ireland, adjourned on the 2d December. They met again on the 9th February, and were soon after called on to discuss a most important department of home policy, namely, the corn laws. The prospect of the return of peace, and of large imports of corn from the Continent, had early excited the attention of the landed interest; and a committee, appointed in the spring of 1813, had made a report to parliament recommending the prohibition of foreign corn, except when wheat at home should be at or above the very high price of a hundred and five shillings the quarter. No proceedings on the subject took place that session, and next year the sense of the public was so unequivocally declared against this extravagant proposition, that a great reduction was indispensable; and, on bringing forward the resolutions connected with the subject, it was proposed to allow the importation of foreign wheat whenever our own should be at or above eighty-seven shillings. Still this limit appeared too high; the debates were warm; the petitions against the bill numerous; and, ministers suspending their support, the main part of the question was in consequence adjourned to next year. In the summer and autumn corn underwent a great fall, and the farmers experienced much distress; the consequence of which, and of the evidence given before the parliamentary committees, was, that government determined to support a corn ing his opponents separate and unsupported. Intelligence bill on a reduced scale, foreign wheat being rendered in- of the first movements of the French reached Lord Wel-

lings. Resolutions to that effect were moved on the 17th February, and a bill founded on them was soon afterwards brought in. It still experienced opposition, particularly from Mr Baring and others, who argued that the limitation price ought not to be permanent, but subject to a graduated abatement during a series of years, till at last the corn trade should arrive at that unrestrained state so essential to commerce at large. But notwithstanding these arguments, and a tumultuous opposition without doors, the bill was carried by large majorities in both houses of parlia-

But from discussions of internal policy, the attention of parliament was suddenly directed to a more urgent topic; we mean the return of Bonaparte from Elba, and a notice of an immediate augmentation of our forces. An address to the regent, in support of this augmentation, was carried by great majorities; and a subsequent motion by Mr Whitbread, to prevent our interference for the reinstatement of the Bourbons, was lost by two hundred and seventythree against seventy-two. Finally, the addresses in approbation of the treaties with the continental powers were supported by Lord Grenville, Mr Grattan, and other oppositionists; the numbers in the Lords being a hundred and fifty-six against forty-four; and in the Commons, three hundred and thirty-one against ninety-two. The further proceedings were an approval of the treaty of peace with America, and of the very questionable transfer of Genoa to the king of Sardinia. The session was concluded by a repeal of the law for fixing the price of bread in London by assize.

The ratification of the peace with America had not been received from the other shore of the Atlantic, when Bonaparte returned from Elba and raised in Europe a fresh alarm of war. He ventured to land with a force barely sufficient to secure his personal safety in a march, and to supply emissaries for mixing with the opposite ranks. The French soldiers are fond of glory, and their attachment revived at the sight of their leader. They first refused to oppose, and soon after pressed forward to join him; and he proceeded in a rapid and unresisted march to the capital. Ought England to participate in the coalition formed to expel this intruder, and to reinstate the Bourbons? On this question there existed, either in parliament or the public, very little difference of opinion; so great was the enmity inspired by Bonaparte, and such the dread of incessant war under his sway. Our ministry soon took their determination; our continental allies were unanimous in the cause; and not a day was lost in preparing for the invasion of France. The Netherlands, it was evident, would be the first scene of operations. Thither the Prussians pressed with all the ardour inspired by recent wrongs and a present desire of vengeance; thither were conveyed from England troops, ammunition, and stores, with all the dispatch afforded by the undisputed command of the sea. By the end of May or beginning of June the Prussian and British force in the Netherlands was superior to any that could be mustered by Bonaparte. It was not till the second week of June that his disposable force, to the number of a hundred and fifteen thousand men, was collected in front of the allied line. This was effected with great secrecy and dispatch. He joined the camp on the 14th, and caused his troops to march early on the 15th, driving in successively the Prussian outposts at Charleroi and Fleurus. From the point whence he marched to Ligny, the Prussian head-quarters, the distance was thirty miles; to Brussels, the head-quarters of Lord Wellington, was nearly twice as far; and all Bonaparte's hope rested on fight-

Regency. lington in the afternoon of the 15th, and made him forth- two and three o'clock, by the French gaining possession Regency with prepare for the march, which, however, he delayed of the village of St Amand, on the Prussian right. To reuntil the arrival of a second courier from the Prussians, and of advices from his own outposts, which should show whether there was any serious attack on other points. In the evening accounts arrived which left no doubt that the absence of which was so bitterly regretted by Ney. The mass of the French army was directed against the Prussians; and orders to march were in consequence issued in all directions, so as to reach even remote stations between three and four in the morning. Our troops began their march from almost every point at day-light, all moving on to Quatre Bras, a spot where four roads meet, and distant seven miles from Ligny. After marching between six and seven hours, several of the divisions stopped to take rest and refreshment; but they were hurried from their unfinished meal by dragoons dispatched to accelerate their advance, for Lord Wellington had by the way received intelligence of the rapid approach of the French. Proceeding promptly with his escort, he had time to reach the head-quarters of the Prussians, and to learn from their impatient commander, that, without knowing the numbers of the French, or their plan of attack, he was determined to accept battle on that day, and upon the ground which he then occupied. Lord Wellington had no controlling power. All he could do was to lessen the pressure on his allies, by pushing, as much as possible, such part of the French as might be opposed to the British. This interview took place between one and two o'clock; and his lordship, returning forthwith to Quatre Bras, found the French tirailleurs already in possession of the wood which skirted and commanded the road. Immediate orders were given to drive them out, a task which devolved on the highlanders arriving from Brussels, and the guards from Enghein, each after a march of twenty-five miles. They succeeded in expelling the French; but the want of artillery and cavalry, neither of which came up till late at night, prevented them from pushing forward with effect. Fresh bodies of the French were now seen advancing; and, on the other hand, regiments of British successively reached the ground. The conflict spread, and was maintained with great gallantry on both sides, but with hardly any other plan than that of fighting straight forward. At first the French possessed considerable advantages, and their cavalry, charging rapidly through the fields of rye, a grain which grows in Flanders to a great height, came unexpectedly on some of our battalions, which suffered severely in consequence, but fairly repelled their antagonists. As our reinforcements came up, the superiority was progressively acquired by us. The French were driven back, and Ney, who commanded, sent to order up a body of twenty thousand men, which had arrived within three miles of Quatre Bras; but the answer was, that they had countermarched to Ligny by order of Bonaparte. They were soon afterwards ordered back, but were unable to join Ney until nine at night, when the fighting had ceased, and the field of action remained in possession of the British. The force engaged on either side did not exceed twenty-five thousand men. Our loss amounted to about five thousand; whilst that of the French appears to have been considerably greater. Both sides fully expected a new battle the next morning. The British, by the arrival of all their divisions, now formed a large army. The French, still strangers to the firmness of our troops, attributed their failure to accidental causes, and declared that their cavalry had been repulsed, parce qu'ils n'avaient pas franchement abordé l'ennemi.

Meanwhile there had been fought at Ligny a battle on a larger scale, and with greater preparation. On the slope of a rising ground, which, however, was much exposed, a Prussian army, of no less than eighty thousand men, awaited the attack of Bonaparte. The fighting began between

occupy this village Blucher made repeated efforts; and it was during one of the most furious of these that Bonaparte is understood to have ordered round the corps, the battle now raged fiercely along the whole line. The masses of Prussian infantry drawn up on the slope were much thinned by the French artillery; but in the village of Ligny, which was repeatedly taken and retaken, the slaughter was peculiarly great. Such was the course of the engagement till the evening at half-past eight o'clock, when the French reserve, marching forward in columns, obliged the Prussians to leave the long-contested field. Their loss on this dreadful day was little short of twenty thousand; that of the French exceeded ten thousand.

Next day Bonaparte adopted the plan of detaching under Grouchy a body of thirty-four thousand men to follow the retiring Prussians, whilst, with the mass of his force, seventyone thousand in number, he turned against the British, in the hope of fighting a battle at the head of superior numbers. Lord Wellington knew not the retreat of his allies till morning, when a similar measure on his part became indispensable; but as his army was in the best state, and as the Prussians had just received a reinforcement, retreat was necessary only until reaching a position favourable for fighting, and for awaiting the co-operation of his allies. Waterloo, he well knew, presented these advantages: his march thither met with no annoyance from the French; and the only fighting which took place on the 17th was at Genappe, in a cavalry action begun by our rear-guard. Bonaparte following with his van-guard, reached the ground opposite to our position, and in the evening ordered a partial cannonade to ascertain if we occupied the latter with an intention to remain. Concluding in the affirmative, he began arrangements for a battle; and next morning he continued under a similar impression, although in his army there was a general belief that we would not venture to await their onset. At ten o'clock he perceived by his glass, in march at a great distance, a corps which he immediately concluded to be Prussians. This necessitated his posting a body of above eight thousand men on his right to receive them; a disposition which deprived him of his numerical superiority, and caused the battle of Waterloo to be fought between equal or nearly equal forces. It began soon after mid-day by an attack on the post of Hougoumont, a chateau or country-seat in front of our right, surrounded by an orchard. The possession of this point would have favoured the approach of the French to our right wing; but though they drove us from the orchard, all their efforts proved ineffectual against our troops, a detachment of guards, stationed in the building and within the court wall. This attack, though very obstinate and sanguinary, was in the eye of either commander only a prelude to the great onset in the centre, which commenced towards two o'clock, being planned by Bonaparte, and conducted by Ney, whose station during the action was in the high road leading straight to our centre. Our army made little show, the battalions being formed in squares, and partly concealed from view by the sinuosities of ground; whilst between each square there were openings sufficient to en. able the battalions to deploy into line, as well as to afford our cavalry space to advance and charge. The squares were further placed en echiquier, like a chess-board, so that the enemy's cavalry, in venturing through an opening, exposed itself to a fire in front from the opposite square, and to a double flank fire from the squares which it had passed. Yet this firm array did not appal the French cuirassiers, who, confiding in past successes and in the protection of their armour, repeatedly tried the deadly experiment of

conspicuous, and never was it more effectually opposed, whether we consider the firmness of our troops, the judgment of our general, or the efficiency of our artillery. The only ground gained by the French was the central point of La. Haye Sainte and the space immediately in front of our line,—the whole being attended, said Ney, by a carnage the most dreadful he had ever seen. Meanwhile Bonaparte watched anxiously the moment when a partial breach or disorder in our line should afford him a favourable opportunity of attacking with his reserve. Ney repeatedly intimated an expectation of great success, but could report no positive advantage, even after the double charge made by the imperial horse guards at five in the afternoon. It became, however, indispensable to act, and Bonaparte could hardly doubt that the long-continued conflict must by this time have greatly weakened our line. Accordingly, between six and seven o'clock, the imperial foot guards, to the number of nearly thirteen thousand, were drawn from behind the ridge which had hitherto covered them from our fire; directed to advance along the high road leading to our centre; and harangued by Bonaparte, whom they answered with reiterated cries of Vive TEmpereur. We are now come to the decisive part of the battle, that part in which, till now, whether at Marengo, at Austerlitz, or at Ligny, success had uniformly attended the charge of a fresh and numerous corps. By what means did it fail at Waterloo? The answer is, that our line, though thinned, was nowhere disordered; that our battalions, though reduced, were firm in their position. Besides, the duke, apprised of the approach of his allies, moved round an additional force from his left to his centre, and directed our battalions to deploy from their squares into a line four deep. Its formidable aspect, and the knowledge of the approach of the Prussians, prevented Ney from attempting the last resource, namely, a bayonet charge by the guards. Their ranks, however, were rapidly thinned, for the fire from the British line was much more extensive and destructive than that of the columns of the enemy. It was now that the duke perceived the approach of the Prussian main body, and ordered a general forward movement; the French retired, at first slowly and in good order; but seeing that behind them all was falling into confusion, the artillerymen and waggon train cutting the traces of their horses, and pressing to gain the high road to which the Prussians were fast advancing, the retreat soon became a rout. Our troops advanced over the field of battle, crossed the hollow beyond it, and towards nine at night reached the ridge occupied by the French staff during the day. Their task was now fulfilled, and the Prussians were left to pursue the flying enemy. The loss on our side amounted to thirteen thousand men; that of the French opposed to us, exclusive of the loss caused by the Prussians, was about twenty thousand.

This great battle displayed no manœuvring; the plan was formed, and the whole was a succession of impetuous attacks and obstinate repulses; but the talents of either commander were not the less conspicuously displayed; the one in making no fruitless application of his force, the other in never permitting the ardour of his troops to lead them from their ground or to deviate from a defensive plan. Bonaparte committed two errors; first, throwing away his superb cavalry so early in the action; and, secondly, as a consequence of this, ordering the advance of his guards, who, though they might penetrate our line at a particular point, had no chance of gaining a victory when unsupported by cavalry, and were besides likely to be soon wanted as a rear-guard to their own army. In the battle Lord Wellington appears to have committed no error. On the preceding days his fault lay in supposing Blu-

Regency, attack. Never was the impetuosity of the French more cher likely to act with discretion, and in remaining per-Regency. sonally at Brussels instead of keeping near to his impatient coadjutor. Had the latter avoided fighting on the 16th, and retreated only twelve or fifteen miles, the allied forces would have been completely in co-operation; and their numbers, a hundred and sixty thousand, would have deprived Bonaparte of every chance of success.

From Waterloo to Paris, the advance of the allies was an almost uninterrupted march; marked on our part by the capture, by escalade, of two towns, Cambray and Peronne, and on that of the Prussians by an unremitting pursuit of the enemy. On one occasion (the 2d of July, near Versailles), a corps of French cavalry re-asserted their claim to fame, and taught the Prussians the hazard of a precipitate advance; but the success was partial, the evacuation of Paris unavoidable, and resistance hopeless, now that almost all Europe was pouring her armies into the French territory. Hence the second treaty of Paris, concluded after many vain appeals to the generosity of the allies, and which burdened France with contributions to the amount of nearly thirty millions sterling, exclusive of the support of an allied army on her frontier. This army, amounting at first to a hundred and fifty thousand men, was reduced in 1817 to a hundred and twenty thousand, and withdrawn in the end of 1818, when all bore the as-

pect of continued tranquillity on the Continent. The time is scarcely yet arrived for viewing, with the calm impartiality of history, our war against Bonaparte; but the more reflecting part of our countrymen can hardly fail to regret our participation in the war of 1793.

Those who know the inoffensive state of the French nation at that time, their general wish for peace, and the reduced condition of their army, can have no doubt that the efforts which subsequently poured forth such a host of combatants owed their existence solely to the threats of the allied powers. Without these the jacobins would not have triumphed, nor would a military adventurer, like Bonaparte, have had the means of acquiring an ascendency. Louis XVI. might have been brought to the scaffold, and republican visions might have prevailed for a season; but the eyes of the people would have been opened to the blessings of a constitutional monarchy much earlier than when threatened with invasion, and obliged, in self-defence, to throw undue power into the hands of their new rulers. The first great error, that of the coalition of 1792, was the act of Austria and Prussia; but of the continuance of the continental war after 1795 we were almost the sole cause. Belgium and Holland had, it is true, fallen into the hands of France, and to recover them was an object of the highest interest; but in attempting this, our ministers made no adequate allowance for the jealousies, the prejudices, we may add the incapacity, of the governments whose aid was indispensable to success. In 1803 circumstances had become extremely embarrassing. France was confirmed in the possession of the Netherlands and Italy, and at the disposal of an ambitious ruler, who studied in peace only the means of fur-ther encroachment. What course was our government to follow? Were they to continue in peace, and to trust for our eventual safety to the progressive extension of our resources and the improvement of our army; or were they to resort to immediate war, and present, by our declared hostility, a rallying point to other powers? An experienced government would have preferred the former; the ministry of 1803 adopted the latter, not from views of ambition, but from yielding to that popular impulse, which it would not, however, have been impracticable to guide and control. As to the course of the war, it was, during the first two years, a contest without decided success on either. side. In its third year, an ill-conducted coalition gave to

France that superiority which was to be expected in the

Regency. case of a great military power directed by a single head. had been adopted and promulgated relative to negro sla- Regency. unexpected change in the calculations of politicians, and showed, in an encouraging light, the power of popular resistance; still its effects, aided even by our military means, produced little decisive of the grand objects of the war. We were proceeding with great zeal and gallantry, but without any definite hope or object, when a catastrophe, as little expected by ourselves as by the French, entirely changed the aspect of affairs, and made it incumbent on us to omit no exertion, financial or military, to redeem the independence of Europe. The success was complete; but aware of the amount of the sacrifices which had been incurred in its prosecution.

Parliament met on the 1st of February, and, after some business of minor importance, proceeded, in March, to discuss the interesting question of our military peace establishment. The navy had been reduced with sufficient promptitude; but there seemed, on the part of government, a disposition to keep the army on a scale neither required by the general tranquillity of Europe, nor justified by our financial means, which exhibited several symptoms of decline. Yet a motion for so moderate a reduction as ten thousand from the proposed number of land forces was negatived by two hundred and two to a hundred and thirty; and, in long debates which ensued relative to the army estimates, ministers carried every point, and were likely to keep up the whole upon an expensive scale; when, on the 18th of March, after a long and animated discussion, the question of continuing the property-tax, modified to five per cent., was decided against them by a majority of thirtyseven; there being two hundred and thirty-eight against general reduction of expenditure, which we should have in vain expected from the reason or reflection of our rulers.

Another measure of importance was the regulation, after a long investigation, of the civil list, on a footing which was adopted as a standard in the beginning of the present reign. This was followed by acts for the consolidation of the English and Irish exchequers, and for the exemption of the bank from cash payments during two years; and, finalthe minor proceedings of the session may be mentioned a grant of L.60,000 a year to the Princess Charlotte and her husband, with a provision, unfortunately too soon required, of L.50,000 to the latter in the event of her demise.

This year was distinguished by an important naval operation, namely, the attack upon Algiers. A project had been submitted to the sovereigns assembled at Vienna in 1814, and at Paris in 1815, for the expulsion of the Turkish militia from the Barbary states; but the representatives of the cabinet of London opposed this proposition, on the pretext that the existence of these states had been guaranteed by treaties; and as the scheme for expelling the Turks had been coupled with an absurd proposal to replace the janissaries with the conventual and military order of the knights of Malta, the success of the English opposition excited no regret. It was generally agreed, however, that an end ought to be put to Christian slavery. however, that an end ought to be put to Christian slavery. vessels of war. At Gibraltar six Dutch frigates, under This was a necessary consequence of the principle which the orders of Vice-admiral Van Capellen, requested to

Such, in a further degree, was the result of the continental very; and England, which had procured the recognition operations of 1806 and 1807. In 1808 Spain occasioned an of the one, undertook the honourable task of effecting the other. But the measures at first resorted to were by no means adequate to the accomplishment of the end in view, and of course failed. An attempt was made to mediate between the regency of Algiers and the kingdoms of Sardinia and Naples; and Lord Exmouth, with a fleet of twentysix ships, of which six were of the line, was employed to superintend this negociation. His Lordship accordingly appeared before Algiers in the month of April 1816; the dey yielded; and peace was re-established between these powers " en favorisent l'avarice du gouvernement Algéit was not till the close of the struggle that we became rien." But all of a sudden the English government assumed a higher tone, and transmitted orders to Lord Exmouth to demand of the dey, first, the immediate liberation of all Christian slaves; secondly, restitution of the sums which had been paid by the courts of Naples and Sardinia for the ransom of such of their subjects as had been dragged into slavery; thirdly, the renunciation for ever of the practice of reducing to slavery the subjects of the Christian powers of Europe; fourthly, an obligation to treat the subjects of Hanover on the same footing and in the same manner as those of Great Britain.

The situation of Lord Exmouth was disagreeable and embarrassing; inasmuch as he was called upon to present, in the month of May, conditions altogether different from those which had been tendered and accepted in the month of April immediately preceding. But the die was now cast. Omar Pasha indignantly rejected the new propositions which the admiral was commanded to submit to him; and having assembled a general divan, obtained the concurrence of the tchiorbagis, the odobachys, and the yoldaches, who rent the air with their ferocious cries, detwo hundred and one. This signal and unexpected defeat claring that they would rather perish than submit to pronecessitated a relinquishment of the war malt-duty, and a positions so humiliating. Pressed by the admiral, however, to give a distinct and categorical answer, the dey had recourse to finesse. He was a subject, he said, of the Ottoman Porte. The question at issue was one of the highest importance, and could not be resolved in a definitive manner by him and the militia of Algiers. It was therefore indispensable that he should take the orders of the grand seignior respecting it. Lord Exmouth was not deceived by this specimen of Algerine diplomacy. ly, by an act for striking off a new silver coinage. Among He knew that the pasha was a man of resolution as well as of address; that he was certain of the support of his furious and fanatical subjects; and that his sole object was to gain time in order to prepare for the conflict which, he foresaw, was impending. However, he affected to be for the present satisfied with the dey's answer, and withdrew to Gibraltar, ostensibly to wait for the decision of the Porte, but in reality for definitive orders from his own government. The latter had already decided on its course.

A powerful squadron was accordingly fitted out at Portsmouth, and dispatched to Gibraltar to reinforce the admiral, who, after its arrival, had under his orders five sail of the line, two of them three-deckers, five frigates of the largest and second class, five sloops of war, four bomb vessels, five gun-boats, furnished each with a sixty-eightpound carronade, and a dock-yard sloop converted into a fire-ship or explosion vessel; in all twenty-five ships and

¹ Speaking of this scheme, Colonel Juchereau de Saint Denys remarks, " C'était mettre le fanatisme Catholique à la place du fanatisme Mahométan ; c'était substituer à une classe oisive et improductive, une classe également ennemie du travail et également dépourvue d'industrie. C'était d'ailleurs un acte du pure demence et cruauté que de vouloir faire gouverner une population entièrement Mussulmane par des moines militaires qui n'avaient été crées que pour combattre perpetuellement et à outrance tous les enne-mis du nom Chrétien, et particulièrement les disciples de Mahomet. Cependant ce projet absurde avait pu trouver des échos parmi les diplomates du congrès de Vienne." Pp. 118, 119.

Regency. join the British fleet in the approaching attack, and probably had stations assigned them, although it does not appear in the very precise and masterly order of battle given out by Lord Exmouth. The fleet arrived before Algiers on the 27th of August 1816. The wind was favourable, and a light breeze enabled the ships to take the positions which had been assigned to them. Lord Exmouth then transmitted his ultimatum to the dey. It embodied in substance the propositions presented in May, and required an immediate answer. None whatever was returned. The decision of the question was left to the arbitrement of battle. The fleet instantly weighed, and, led by the flag ship, Queen Charlotte, of a hundred and twenty guns, came to anchor within pistol shot, or rather less, of the batteries on the Mole, and those situated towards the western part of the town. The Queen Charlotte anchored across the entrance of the port, so as to take in flank and reverse such of the batteries as were furthest advanced, and she was supported by the Superb and Impregnable, which were directed to anchor as close to her as possible, to be made fast to each other, and hove together in order to concentrate their fire. The Albion had orders to supply the place of either of the two last mentioned ships that might be thrown out; and, in case of both getting their places, to present her broadside against a flanking battery of three guns, and enfilade the northern part of the works by throwing part of her fire upon the upper tier of the light-house battery. The Dutch appear to have taken their station on the left, in order to produce a diversion by commanding the exterior batteries and forts of the eastern part of the place. All these movements were executed with that admirable order and precision which distinguish the operations of the British navy, and also without opposition. The dey, it is said, wished to avoid the reproach of being the first to commence hostilities; and it has been thought that this capital fault contributed to decide the fate of the action. But this is a mistake. Had the Algerines opened their fire on the ships as they approached, the casualties might have been more numerous, but the result would have been the same.

> When the British line of attack had been completely established, two shots were fired on the flag ship from the grand battery of the Mole. The instant he saw the flash of the guns, Lord Exmouth gave the word "Fire away my lads," and the cannonade immediately became general. The battle commenced at three o'clock in the afternoon, and continued without any intermission until nine in the evening, when a land breeze springing up, the ships weighed anchor, and gained an offing, to prepare, if necessary, for a renewal of the attack. While the combat was at the hottest, a detachment of English seamen and marines entered the harbour amidst a murderous fire of grape and musketry, and succeeded in setting fire to and destroying the whole of the Algerine fleet; an event which made a terrible impression on the population of Algiers, and in fact completed its demoralization. They then found what a formidable and daring enemy they had had the hardihood to contend withal; and horror soon gave way to despair. The dey durst not risk a renewal of the combat; but next day (the 28th of August) gave his unqualified assent to the propositions which, twenty hours before, he had scorned even to entertain. The terms which Lord Exmouth had the glory to dictate were, first, the total abolition of Christian slavery in future; secondly, the immediate liberation of all slaves within the territories and dependencies of Algiers, of whatever nation they might be; thirdly, the restitution into the hands of the English admiral of the various sums which had been paid since the commencement of the year by Christian powers for the ransom of their subjects

dragged into slavery; fourthly, an indemnification to the Regency. English consul for the losses he had sustained, and an apology by the dey in the presence of his ministers and officers for the indignities which the consul had suffered in being arrested and detained in prison during the battle. This was followed by the conclusion of a treaty of peace with the Netherlands, by which all arrears were discharged, and that country ceased to figure among the tributaries of Algiers. Such were the results of this memorable battle, which, to use the words of Sir Charles Ekins (Naval Battles, p. 304), "bore the character of a crusade in behalf of Europe, rather than on the part of Great Britain alone, which excited a prodigious sensation throughout all Christendom, and which was believed to have put a final stop to Barbary piracies and depredations."

A general want of work and reduction of wages continued during the year, subjecting the lower orders to great distress, and exposing them to the arts of designing demagogues. Large assemblages, particularly in Spafields, took place previous to the meeting of parliament; and on the day of its opening (the 28th of January) the regent was insulted on his way to the House of Lords. A secret committee of each house was soon afterwards appointed to examine papers in the possession of government, said to bear evidence of serious projects of insurrection; and each made a speedy report, declaring the existence of very dangerous societies. There was in these reports a strain of confident allegation, unaccompanied by specific proof or temperate reasoning, which brought to recollection the declamatory state papers of the French revolution, and gave the reports the appearance of documents framed to disseminate alarms, and justify extreme measures. They engaged, however, the serious attention of the house, and the result was a bill for the suspension of the habeas corpus act during the current session of parliament; a measure carried in the Lords by a hundred and fifty to thirtyfive, and in the Commons by two hundred and sixty-five to a hundred and three. Towards the close of the session a second report from the secret committees produced an act for continuing the suspension of the habeas corpus to the 1st of March 1818.

The continued want of work, and the distress of the lower orders, led to an act for authorizing the issue of exchequer bills to persons finding employment for the poor. The same causes inducing the public to call loudly for retrenchment, the opposition, on the 25th of February, took the sense of the House of Commons on a motion to reduce the number of the lords of the admiralty, and mustered a hundred and fifty-two votes against two hundred and As an offering on the part of government to the prevailing demand for retrenchment, an act was passed for abolishing the two sinecure offices of justice in Eyre.

Mr Abbot, who had filled the office of speaker of the house since 1802, finding himself incapable, from continued indisposition, of performing its arduous duties, sent in his resignation, and was succeeded by the Right Honourable Charles Manners Sutton. Mr Abbot was forthwith raised to the peerage by the title of Baron Colchester; and, on the 6th of June, a vote passed the Commons for settling on him a life annuity of L.4000.

Parliament was opened on the 27th of January under circumstances which indicated that the want of work and the distress of trade, though still considerable, were less serious than in the preceding year. A secret committee, appointed anew by each house, reported to that effect; and on their recommendation was brought in a bill to indemnify persons, chiefly magistrates, who had acted in apprehending and detaining individuals suspected of treasonable practices. This bill was not carried without considerable opposition.

Regency. 1819.

The death of the Princess Charlotte having caused a that of the neutral party. We allude to Mr Tierney's Regencyroyal dukes became a subject of consideration; but the provision for any increase of expenditure was exposed to difficulty, as well from the distress of the public, as from the near approach of the time when the members were to meet their constituents. A motion made by ministers to grant L.10,000 additional to the Duke of Clarence was not successful, an amendment for reducing it to L.6000 having been carried by a hundred and ninty-three to a hundred and eighty-four. Votes, equally restricted, were passed in the case of the Dukes of Kent and Cambridge; and an attempt to obtain a similar grant to the Duke of Cumberland, who had been several years married, was negatived but a provision of L.6000 a year was made for the duchess in case she should survive him.

Among the transactions of this year was a grant of L.400,000 to Spain, as a compensation for losses attendant on an early abolition of the slave-trade by that power. Certain acts were also passed for the humane treatment of negroes in our sugar colonies. The bank exemption act being about to expire, Mr Vansittart brought in a bill for continuing it another year, on the ground that the loans now contracting in England for France and Prussia carried capital out of the country, and prevented the bank, for a time at least, from diminishing its paper circulation.

Mr Brougham having, early in the session, brought in a bill for investigating the abuses of public charities, it was Commons, passed to the Lords. There it encountered opposition from Lords Eldon and Redesdale, and was returned to the Commons with material alterations; the commissioners charged with the inquiry being limited in their powers, and restricted to charities connected with education. The act, however, passed in this state, and the labours of the commissioners, like those of the committee on the education of the poor, have been productive of much public advantage. The session was closed on 10th June by a speech from the regent, containing a notice, not only of the prorogation, but of the dissolution of parliament; a measure which for many years had been announced by proclamation.

The new parliament met on the 14th of January 1819. and on the 21st proceeded to business. The demise of the queen having taken place during the recess (on the 17th November), one of the first measures was to vest the custody of the king's person in the Duke of York, who, very imprudently, under the circumstances of the country, demanded and received from parliament an annual allowance of L.10,000 for discharging an act of filial duty. This formed a striking contrast to the conduct of the Marquis of Camden, who, possessed of the lucrative sinecure of teller of the exchequer, relinquished L.9000 a year of it to the public; a sacrifice noticed in honourable terms in a vote passed in parliament on the occasion.

Such was the addition made to opposition, by an election under circumstances of general distress, that several measures were carried in this session against ministers; in particular, a motion on the 2d of March, by Sir James Mackintosh, for a revision of the criminal code, where the numbers were a hundred and forty-seven against a hundred and twenty-eight, and a motion for a committee on the state of the Scottish burghs, carried by a hundred and forty-nine to a hundred and forty-four. In the division on the grant of L.10,000 to the Duke of York, the opposition mustered a hundred and eighty-six votes against two hundred and eighty-one. But the impression excited by these successes was greatly enfeebled by a motion, which arrayed on one side all the strength of government and for a committee on the state of the country was negatived

blank in the succession to the crown, the marriage of the motion for an " inquiry into the state of the nation," which was negatived by three hundred and fifty-seven to a hundred and seventy-eight; a division evincing that, though disposed to co-operate with opposition occasionally and for specific objects, the neutral party had no wish for a change of ministry. Encouraged by this success, Mr Vansittart came forward with the bold proposition of new taxes, to the extent of L.3,000,000, on the ground of a sum of that amount being absolutely necessary to give efficiency to the sinking fund. Of this sum the chief part was expected from an increase of the duties on malt, spirits, and tobacco; but part also was to be derived from a tax on foreign wool (6d. per lb.); a most singular impost by a hundred and forty-three to a hundred and forty-six; in a country where the exportation of manufactured wool forms a main branch of the national industry. Ministers were conscious of its injurious tendency, but were obliged to bring it forward as an equivalent to the landed interest, for the fresh burden exacted from them in the malt-duty.

The further debates of the session related to the Catholic question and the resumption of cash payments. In the contest pending at this time between Spain and her American colonies, ministers took part with the mother country, so far at least as to discourage by act of parliament the enlistment of our officers and soldiers on the side of the insurgents. In the preceding session L.1,000,000 had been voted for building additional churches and chapels for the established religion in England; and this year referred to a committee, and, after some discussion in the L.100,000 was appropriated for a similar purpose to the established church of Scotland. The last act of the session was a grant made in July, of the limited sum of L.50,000, to be shared by government among persons settling on particular conditions at the Cape of Good Hope. This was the first pecuniary aid given by government towards emigration, which is accounted by some the only remedy for our overstock of labourers and manufacturers.

> The revival of commercial activity in 1818 proved unfortunately of short duration. Distress returned towards the end of that year, and assumed an aggravated aspect in the course of 1819. This produced popular assemblages, and led, on 16th August, to an unfortunate scene at Manchester, in which the interference of the yeomanry cavalry to disperse a very numerous meeting of the people was productive of loss of life to a number of persons, and of bodily injury to a great many. The irritation excited among the lower orders by this proceeding, and by the continued pressure of poverty, led to the dissemination of a spirit of discontent and insurrection which necessitated the assembling of parliament on the 23d November. The speech of the regent, as well as the discussions of both houses, were directed to this painful subject; and the alarm excited among the aristocracy, joined to other considerations, having finally detached the Grenville party from the opposition, the latter now mustered in less formidable array. On the division for an amendment upon the address to the regent, the numbers were a hundred and fifty against three hundred and eighty.

Several bills were afterwards introduced by ministers for the prevention of disturbances. These consisted in imposing a tax on the petty publications circulated among the lower orders; impeding the circulation of libels; authorizing the seizure of arms; and forbidding military training or seditious meetings. These bills produced long and animated debates; but the most considerable division on the side of opposition, namely, that for limiting the act against seditious measures to three years instead of five, consisted of only a hundred and fifty votes against three hundred and twenty-eight. A motion of a more comprehensive nature

Regency. in the Lords by a hundred and seventy-eight to fortyseven; in the Commons by three hundred and ninety-five to a hundred and fifty.

After transacting this and other business of an urgent nature, parliament adjourned; but was soon after brought together by an event which, however conformable to the course of nature, was not at that time expected, namely, the death of George III. The day after the demise, agreeably to established usage, both houses met, and took the oath of allegiance to the new sovereign. On the 2d February they adjourned till the 17th, the day after the interment of his majesty. On that day both houses voted an address of condolence to the present king, after which they proceeded to transact such business as was pressing, and might, according to law, have continued to sit during six months; but ministers judged fit to resort to a dissolution. Another election now took place under circumstances of general distress. The new parliament met on the 21st April, and was opened on the 27th by George IV., in a speech declaring his anxiety for strict economy, but regretting that the state of the country was such as to admit of no reduction of the military force.

The peace of Amiens at first gave hopes of the improvement of Ireland by the introduction of British industry and capital; but these hopes were soon clouded by the renewed contest of 1803. In that contest the public in England and Scotland joined with almost unexampled zeal; but Ireland was less cordial, although it would be altogether erroneous to connect with any political party, whether Catholic or Protestant, the miserable insurrection of the 23d of July 1803. A plot to seize Dublin, almost as extravagant as that of the Cato Street conspiracy in London, was framed by a few infatuated individuals; and in the tumult, which burst forth with great violence but with feeble means, Lord Kilwarden, the chief justice, unhappily lost his life. A party of military soon dispersed the rabble; and of their leaders, most of whom were afterwards apprehended and executed, the only one entitled to notice was Robert Emmett, a young man whose education and talents ought to have placed him above such desperate attempts. The alarm thus excited engaged some time after the attention of parliament, and led to the enactment of two bills, one for a renewed suspension of the habeas corpus act in Ireland, the other for trying rebels by martial law.

The encouragement so generally given to the volunteer system in England and Scotland was not extended to Ireland, from a dread of embodying indiscriminately a people of whom so great a proportion were disaffected. The yeomanry, however, or select volunteers of Ireland, were very numerous, being about eighty thousand; and they had been highly instrumental in putting down the unfortunate insurrection of 1798. In addition to these, Ireland required a body of our regulars and militia amounting to nearly fifty thousand men as a defence against invasion, a guarantee of public tranquillity, and a check on illicit distilla-tion and smuggling. The return yielded by Ireland in the shape of revenue was small, but her supply of recruits to our army and navy was very considerable.

The suspension of the habeas corpus act continued in 1805, a year remarkable as the first in which the Catholic question was submitted to parliament. It was brought forward in the Commons by Mr Fox, in the Peers by Lord Grenville; and curiosity was strongly excited in regard to Mr Pitt, who had lately accepted office without carrying his professed object, the grant of political privileges to the Catholics. The minister, however, extricated himself with address; declaring that if his vote could give the Ca-

claims; and this, in fact, was sufficiently shown by the Regency. division which ensued, and exhibited three hundred and thirty-six votes against them, with only a hundred and twenty-four in their favour. Next year the appointment to office of Lord Grenville and Mr Fox raised high the hopes of the Catholics; but the known repugnance of the sovereign to their claims induced these ministers to dissuade a direct discussion of the question in parliament, under an assurance that they would do whatever should be otherwise practicable for obtaining the removal of disabilities. Hence the bill of February 1807, which caused the dismissal of the Grenville ministry, and excited such a ferment in England against the Catholics, as to render it wholly unadvisable to bring forward the question for several years.

In 1809 the Catholic committee in Dublin held public meetings, but confined themselves to preparing a new petition to parliament. Next year they went much farther, and sought to assume an imposing attitude, proposing that ten persons should be deputed by each county to Dublin, and there form an assembly, charged not only with the duty of preparing petitions to parliament, but of taking measures for the redress of the general grievances of the Catholic body. The secretary for Ireland, Mr Wellesley Pole, alarmed at this design, addressed circular letters to the sheriffs of counties, requiring them to prevent the election of the proposed delegates, and even to arrest all persons taking part in such elections. But this order appeared too peremptory to the opposition, and a debate took place, in which Mr Wellesley Pole explained, that, so long as the Catholics confined their proceedings to petitioning, they had received no interruption; but that the delegates proposed to go much farther, and that a body, under the name of a Committee of Grievances, had assembled weekly in Dublin with all the forms of parliament. The house supported the measure adopted by Mr Wellesley Pole, and disapproved of the proceedings of the Catholics. Still the latter deemed this session not unfavourable to the discussion of their political claims, on account of the laurels lately won by our armies in Spain and Portugal, which counted many Catholics in their ranks. The question was brought forward by Mr Grattan, but lost by a large majority in both houses.

The same fate attended its discussion next spring. Another year elapsed; and in the session of 1813 it was brought forward with more combination and better prospects. Mr Grattan, supported by a part of the Cabinet, obtained the assent of the house to several preliminary resolutions; first, that the Catholic disabilities ought to be removed; secondly, that the Catholic clergy should bind themselves by oath to hold no correspondence with Rome except on ecclesiastical business; and, thirdly, that two commissioners should be appointed for examining into the loyalty of persons recommended as deans or bishops among the Catholics. The time occupied in these discussions was considerable, and gave occasion to the Catholic clergy in Ireland to testify their dissent from several of the provisions, particularly from that which restricted their correspondence with Rome. The knowledge of this dissatisfaction made a deep impression on parliament, and gave a turn to the question which induced the supporters of the bill to withdraw it for that session.

The ensuing year unfortunately gave further evidence of the want of temper and union among the Catholics. The court of Rome recommended their acquiescence with the propositions of Mr Grattan; but meetings of the Catholic board at Dublin disclaimed indignantly all foreign interference; and the clergy passed resolutions against the tholics what they desired, they should not long want it, but appointment of any Catholic bishop by the British governthat at present the prevailing sentiment was against their ment. The intemperate proceedings of the Catholic board Regency. now led government to dissolve that body, and declare its the development of our resources, and the expansion of Regency.

meetings contrary to law.

1820.

These dissensions prevented the question from being submitted to parliament in 1814. Next year it was brought forward by Sir Henry Parnell, not by Mr Grattan, who declared that an unconditional grant of the demands of the Catholics was not to be expected, and that, without cultivating a spirit of conciliation, they never would succeed. The motion was lost by a great majority. In 1816 it was again brought before parliament, but in two distinct petitions, of which the more temperate, introduced by Mr Grattan, received the support of a hundred and forty-one against a hundred and seventy-two.

In the year 1817 the question was proposed by Mr Grattan, with the same views as in 1813, and supported by two hundred and twenty-one votes against two hundred and forty-five. The disappointment caused by this failure was soothed not only by the large minority, but by a very substantial concession, obtained soon after, on the proposition of ministers, namely, an act to enable Catholic officers in the army and navy to attain rank nearly on the plan proposed by the Grenville ministry in 1807. In 1818 the Catholic question was not agitated; but in 1819 the tone of that body having become more conciliating, Mr Grattan's motion for taking it into consideration was supported by two hundred and forty-one votes against two hundred and forty-three. Further details of the progress of this great measure towards a successful conclusion will be given in the course of the narrative.1

There is another subject which deserves a particular notice in this place, more especially as it is connected with an event of deep and lasting interest. We allude to reform in the representation of the people. For several years anterior to 1816, the question had been but little agitated, and seemed to be abandoned to occasional declaimers and mere pot-house politicians. But the general distress which prevailed during that and the following years, with the discontent consequent on the privations to which the working classes were exposed, redirected their attention to a subject which they had too long lost sight of; and as it seemed obvious that the pressure of taxation, added to the evils occasioned by a transition from a state of war to a state of peace, formed the principal obstacle to

the productive powers of industry, an opinion began to gain ground among the people, that the evils under which they suffered would never be materially mitigated, much less effectually cured, until a reform had been effected in our system of representation. One of the first symptoms or manifestations of the revival of an interest in this question was afforded by the Spafields meeting, which took place on the 2d December 1816; and although the tumult and violence in which that assemblage issued produced considerable alarm, and brought no little discredit on the cause, yet the defeat of government in the state prosecutions which followed, the continued pressure of distress, and, above all, the invincible truth that the people were inadequately represented, and that they experienced many of the evils of the worst government under one held forth as the best, served to overcome every disadvantage, and to keep alive the interest which had previously been excited. The Spafields riots were soon forgotten; and although no overt manifestations of any consequence took place during the two following years, still the conviction of the necessity of parliamentary reform continued to gain ground, and the cause began to find advocates in quarters where it had previously been regarded with indifference, if not with aversion. Reformers, though agreed in principle, were indeed much divided in regard to detail, or rather as to the extent to which the principle ought to be carried; and extreme doctrines began to be openly and boldly promulgated by many persons, who about the year 1819 received the appellation of radical reformers, and were at this time regarded with affected contempt, but with real terror, by the partizans of the existing system. But neither this diversity of views, nor the dread which many persons entertained or pretended of radical theories, retarded the progress of the cause, or prevented it from daily gaining new converts. On the 12th of July 1819

Such were the final acts of 1819, and of the reign of

Birmingham ventured on the bold experiment of electing

a legislatorial attorney to represent that great town in the

House of Commons; and on the 16th of August follow-

ing took place that memorable meeting at Manchester,

already mentioned as accompanied with such disastrous

¹ The following table exhibits, in a synoptical form, the times and results of the parliamentary discussion of the Catholic Question from 1805 to 1819 inclusive.

Reign of George III. The public conduct of this monarch, and the George IV. tendency of the political principles by which it was governed, the reader will judge of for himself, from the narrative of the events of his reign; as to his private and domestic character, it is admitted on all hands to have been highly respectable. He was distinguished for probity and a sense of religious obligation; in his habits and manners he displayed equal moderation and simplicity; his disposition, though unyielding, was benevolent; and both as a husband and a parent he was highly estimable. His intellectual faculties, originally of no high order, were permanently clouded by the constitutional malady which exhibited itself at an early period of his life; he adhered with invincible obstinacy to the maxims of government instilled into his mind by his early instructors; and he cherished an attachment to the church of which he was the head, that amounted to a species of bigotry, if not to fanaticism. Yet he loved and patronised the fine arts, particularly music and painting; he collected a noble library; he had a taste for agriculture and some of the mechanic arts: and he was at once plain and unpretending in his manners; all which circumstances go very far in the case of a king. Hunting and the penal laws against the Catholics formed the things which, next to his own family, he was most attached to; and his scruples of conscience long stood in the way of national justice.

1820.

Reign of George IV. 1820.

rious Motions and Proceedings.-Cry for Reform daily in- violence of their language had added to the ministerial Reign of creasing.—Death and Character of George the Fourth.

George III. closed his career on the 29th of January 1820. He had been so long withdrawn from the eyes of the world, that the event could scarcely be called the termination of a reign. The prince who succeeded him on the throne had virtually discharged all the offices of king for nearly eight years. The same line of policy continued to be persevered in, as nearly as events permitted; the same ministers continued to manage the affairs of state; the prosperity of the country received no sudden shock nor increase; and public opinion went on to form itself, without experiencing any sudden impulse. The customary bell, which announced by its monotonous clang that a king had been gathered to his fathers; the sorrow, real or affected, of personal friends; a slight alteration in the tenor of writs; and some unimportant changes in the arrangements of office, were the only indications that a new reign had commenced.

The ministers, as a matter of form, resigned their places the day after the death of the old king, but were all of them immediately reinstated. It is the law and custom of the country, that if no parliament be in existence at the death of the king, the last immediately revives, and continues to sit for six months, unless dissolved at an earlier period by the new monarch. If a parliament, however, be in existence but not sitting at the time, it assembles with the least possible delay. The House of Commons met, on the present occasion, about noon of the 31st of January, and the Lords a little later in the same day. At this meeting no business was transacted beyond the simple ceremony of taking the oaths of allegiance. Some additional members were sworn next day, when the house adjourned till the 17th of February. This was done in conformity with the uniform practice of parliament on the demise of a king to suspend its operations until after the

On the day appointed both houses again met; and by this time ministers had fully resolved upon the course they were to pursue. Messages from the king were presented by Lord Liverpool to the Peers, and by Lord Castlereagh to the Commons. The tenor of both was the same. king felt persuaded that the House of Lords, and his faithful Commons, sympathized with the late loss which he and the nation had sustained. He reminded them that the melancholy event imposed upon him the necessity of summoning a new parliament within a limited period; intimated his opinion, that in the present state of public sentiment it was expedient to take this step without delay; and recommended to the Commons to adopt, and to the Lords to concur in, such measures as might be found necessary to provide for the public exigencies during the interval which must elapse between the dissolution of the old and the opening of a new parliament.

The reasons assigned by ministers for thus precipitating the assembling of a new parliament were in themselves quite satisfactory. The quantity of business before the legislative bodies was so great, that it could not possibly be completed within the prescribed period. The assizes would take place during its continuance, and render the absence of many members necessary; while the cares and bustle of an approaching election would distract the attention of all. Notwithstanding the weight of these arguments, the opposition discovered, or affected to discover, another reason for the resolution which had been taken of dissolving parliament immediately. The unpardonable assault upon the people at Manchester during the preceding year, and the subsequent policy of ministers, had deeply exasperated a large body of the lower orders; and the Having by the license they held out, attracted a sufficient

party, already numerous among the wealthier portion of George IV. the community, all the timid and wavering adherents of opposition. That party saw, therefore, in the attempt to precipitate a general election, the desire of ministry to obtain a parliament returned at a moment when the influence of fear had materially swelled their majority, and secured, by the prospect of a long career, against that popular influence which uniformly exercises greater control over the members in proportion as an appeal to their

constituents approaches.

In the desultory opposition, however, which was offered to the course recommended in the king's message, Mr Brougham was the only speaker who ventured to take this ground. The rest of his party, both in the Lords and the Commons, discussed the question as one of form and privilege. Lords Lansdown, Grosvenor, and Carnarvon, in the upper house, and Mr Tierney in the lower, while they admitted the dissolution of parliament to be regular and constitutional, objected to the recommendation to provide for it, as savouring of dictation, and infringing the liberty of the legislature. The ministerial party, however, strengthened as it had been by its accession of numbers, was too strong to be resisted. Bills were introduced, continuing the mutiny act and the marine mutiny act until the 24th of June. Certain sums of money were voted towards defraying the expenses of the army and the extraordinary civil charges. And in addition to these, two hundred thousand pounds were granted "towards satisfying such annuities, pensions, or other payments, as would have been payable out of the consolidated fund of Great Britain, or out of the civil list, in case the demise of his late majesty had not taken place before the 5th of April 1820." This grant is in no other way remarkable than as having afforded the first opportunity of introducing a discussion which was destined to engross almost the whole attention of parliament during that year. The opposition, understanding that in this sum of two hundred thousand the queen's allowance was included, made a stand to have an express provision made for her. The resolutions were, however, agreed to without any alteration in their form. When carried to the House of Lords, they experienced some further opposition from Lord Lauderdale, on the plea that the power which had been assumed by the House of Commons, of appropriating the supplies and authorizing the payment of pensions otherwise than by the constitutional method of passing the appropriation bill, was an infringement on their lordships' privileges. This diffi-culty was met by Lord Liverpool, who moved an amendment, "that this house, from the state of public business, acquiesce in the resolutions of the Commons, although no act may be passed to give them effect." These necessary arrangements having been completed, parliament was dissolved in the usual form on the 29th of February, and a new one summoned to meet on the 23d of April.

In the mean time government was beginning to learn by experience the effects of attempting to repress by arbitrary enactments the public expression of popular feeling, in the growth of those dark and sanguinary plots which are ever the consequence of violent attempts to Arthur Thistlewood, a man of respecstifle complaint. table connections, and originally of some property, but who, by his own profligate habits, had been reduced to a state of abject poverty, entered into a conspiracy, with a few others of like desperate fortunes, to overturn the government. Thistlewood's plan was to seize the opportunity of the late king's funeral, when it was expected that all the military would be engaged at Windsor, to make themselves masters of London, and plunder the shops.

Reign of force of the needy and discontented to rally round them, whether with or without the encouragement of ministers, Reign of George IV. he proposed to establish a provisional government, and send to the sea-ports, to prevent all gentlemen from leaving England without passports. The more sanguinary brutality of his uneducated companions in part overruled him. It was resolved to assassinate the ministers, when assembled at a cabinet dinner at Lord Harrowby's. While one party effected the massacre, others were to seize the two pieces of cannon in Gray's-inn Lane, and the six pieces in the artillery ground. Emissaries at Hyde Park were to intercept any messenger dispatched to Windsor. A body of conspirators were to cross the Thames and take the telegraph, to prevent any communication with Woolwich. The Mansion House was fixed upon as the seat of the provisional government. A few disbanded soldiers had been induced to join in the plot; a motley assortment of arms had been provided; and proclamations were written out in the name of the provisional government, for the purpose of being stuck up on the walls.

The conspirators were as deficient in caution as their plot was in any reasonable likelihood of success. They were surprised in the garret or hay-loft in Cato Street where their meetings were held, on the evening of the 23d of February, the same on which the massacre of the ministers was to have been perpetrated. After a desperate resistance, in which one police-officer was killed, and several severely wounded, the greater part of the band were apprehended. Thistlewood and some others were not secured till next day. A few of the more cowardly turned king's evidence, and the guilt of the conspirators originator of the plot, Brunt his lieutenant, Ings, who was to have been secretary to the provisional government, Tidd, and Davidson, a man of colour, were ordered for execution, and suffered the penalty annexed to treason

on the 29th of April.

The most diligent inquiries of government could not discover any ramifications of the plot. Every thing that has since transpired strengthens the belief that these desperadoes stood alone. Thistlewood had, a short time before his arrestment, made a tour through the manufacturing districts of England and Scotland. There can be no doubt that he had endeavoured to engage the radical party in some undertaking equally violent with that for which he suffered, but more extensive. About the close of 1819, or early in 1820, a messenger was dispatched to for no assistance from the country in his attempt. The opinion of his want of success in the attempt to stir up the working classes to co-operate with him, is further corroborated by the coarse manner in which he affirmed to one of his associates, that " no one who was worth ten pounds was worth any thing for the good of this country.

Still, although even the discontented portion of the community turned with disgust from projects of assassination, there was much in the disposition of the lower orders to afford grounds for apprehension to the ministers under whose auspices Castlereagh's acts had been introduced and passed into a law. Throughout the manufacturing districts the working classes were associated in unions. The writer of this sketch remembers in the autumn of the preceding year to have accidentally overheard a discussion held by a pretty numerous body of weavers in the neighbourhood of Glasgow. The prevailing sentiment seemed to be, that the interests of the rich were diametrically opposed to those of the poor; and the conviction was pretty generally expressed, that a time was near at hand when the relative positions of the parties would be inverted. In this state of affairs spies were liberally dispersed through the disaffected districts; and these men,

endeavoured to break the force of public discontent by George IV. encouraging partial explosions. In the course of the month of March, inconsiderable bodies of the people rose in arms in Lanarkshire and Yorkshire. These demonstrations, by alarming the holders of property, attached them more firmly to government. The punishment of the insurgents cast a damp over the spirits of the disaffected; and, to strengthen the impression, the most severe measure authorized by the late laws was likewise awarded to every man who expressed in strong language his disappro-

bation of the policy of ministers.

The events to which we have hitherto adverted served either to indicate the strength of the ministry or to increase it. The elections to the new parliament left them much in the same position in which they were at the dissolution of the old. But a discussion was impending over them, which threatened to task their powers to the utmost. The dispute between the Prince and Princess of Wales was a matter of very secondary importance compared with that between the king and queen of England. The hatred which George IV. entertained for his consort was invincible. He had relinquished his early principles and most intimate friends, rather than struggle with a party which he found firmly established in power; he had conformed to the system of policy they had adopted, without suggesting one modification; he was contented that the course of national exertions should be controlled and guided by other minds; but his passive disposition left him the moment the question was urged of conceding even the external was clearly established. Five of them, Thistlewood the resemblance of respect to the queen. Her name was omitted in the liturgy; the utmost anxiety was displayed to avoid, if possible, making any parliamentary provision for her as queen; the common civility of announcing to her the death of her father-in-law, who was moreover her blood relation, was not observed; and she was given to understand, that if she attempted to return to England, she would be instantly visited with a bill of pains and penalties. But her majesty stood upon her rights; and after several ineffectual negociations on the part of those friends of the royal disputants, who feared the consequences of a public agitation of the question at issue between them, she landed at Dover in the month of June. Her journey to London was a triumphant progress; and her reception there by the populace most enthusiastic.

On the 6th of June, the Earl of Liverpool in the Peers, Thistlewood from Leeds, to assure him that he need look and Lord Castlereagh in the Commons, presented a message from the king, recommending to the immediate attention of these bodies "certain papers respecting the conduct of her majesty since her departure from the country." The Lords, after slight discussion, referred the communication to a secret committee. The same course was adopted by the Commons, but after a more violent debate. Her majesty's friends had in that house touched upon the subject even before the dissolution of the old parliament. Lord Archibald Hamilton had complained of the unconstitutional dictation to the church of Scotland on the point of praying for the queen. The resolutions by which a temporary supply was voted to the king had not been allowed to pass without the question being asked, in what manner the interests of the queen were to be secured. Now the storm burst in its full strength on the heads of ministers. Not a few members declared, that without examining witnesses, they were convinced of her majesty's innocence by the line of conduct which the government had pursued.

The guilt or innocence of Queen Caroline is a question of very subordinate importance in an outline like the present. It deserves attention merely because of the influence it exerted upon the public mind, and its effects upon the subsequent course of events. Now that the excitement of

Reign of the contest has subsided, few, we believe, would assert her The usher summoned the house to attend the lords com- Reign of indulgence of a private pique, at the hazard of national tranquillity, was clearly discernible; whilst the ministers, who endeavoured to gratify the royal antipathy, sunk in the estimation of the country. And that this was the feeling of the wealthy, as it was of the poorer classes, is eviof their bill against the queen.

the 5th of July Lord Liverpool presented a bill of pains by counsel was presented the same evening, and refused. least allow her counsel to state at their bar the nature of her claims. This request was in so far complied with, that Messrs Brougham and Denman were heard relative to the mode and manner of the proceedings to be had upon the place. Their arguments were ineffectual. A list of witnesses was refused. The bill was ordered to be read a reading. The proceedings commenced on the 17th of August, and were continued, with scarcely any intermission, till the 4th of November. On that day the Lords committee, but finally retained by a majority of sixtyseven in a house of a hundred and ninety-one. When their Lordships came to divide upon the question of the third reading, it was still carried in the affirmative, a hundred and eight voting for, and ninety-nine against it. Lord Liverpool immediately announced, that, looking to the narrow majority and the temper of the country, he had come to the determination not to proceed further with the measure. He accordingly moved that the bill do pass that day six months.

During the trial repeated attempts had been made by the House of Commons to put a stop to the proceedings. Ministers, unable to parry the reiterated and vehement attacks directed against them, had recourse to repeated adthe House of Lords adjourned to the 23d of November, to which day the House of Commons at that time also stood and Mr Brougham having communicated to the speaker that a message would be sent down from the queen, suggested at the same time his taking the chair at one o'clock, in order that there might be an opportunity of receiving the about a hundred members, chiefly of the opposition party, were present, but the speaker did not appear. He was understood to be closeted with Lord Castlereagh. At length he entered the house, and exactly at two the reading of prayers concluded. Mr Denman immediately rose and announced that he held in his hand a message which the queen had commanded him to present to the house. Before he could proceed the deputy usher of the black rod entered. His appearance was the signal for uproar. "Mr Den-

The speaker on his return declared the house adjourned to the 23d of January.

Respecting the rank injustice of the proceedings against the queen there cannot now be two opinions. She was attacked by an anomalous procedure, which was neither dent from the narrow majorities which an administration trial nor bill of divorce. The pains and penalties inflicted so strong on every other question commanded in behalf by the bill were such as could not have been extended to any other English subject. The law of England guarded A brief sketch of the proceedings in the House of Lords every other woman in the kingdom against such a meawill suffice to show the character of the prosecution. On sure. Again, by adopting the mode of procedure by bill, her prosecutors escaped the necessity of furnishing her with a and penalties against the queen. Her petition to be heard list of witnesses, and thus crippled her defence. Lastly, by allowing the measure to drop after the third reading On the 6th her majesty again petitioned the house, re- had been carried, the ministers clearly established that the questing, that if their Lordships were resolved to refuse personal degradation of the queen was all they sought for, her a hearing at that stage, and likewise to refuse a list and that the vindication of the national honour was a mere of the witnesses to be adduced against her, they would at pretext. In what other instance was that iron administration known to pause out of respect to public opinion? The effect of the proceedings upon the power of the ministry was twofold. It distracted the attention of the country for a time, and men ceased to brood so incessantly over bill, and the time when these proceedings should take their distress; but, on the other hand, it swelled the ranks of opposition, and embittered its tone of feeling.

Amid these stormy discussions, in which the remotest second time, and evidence to be led during its second districts keenly participated, the more vital interests of the country were comparatively neglected. Still the universal stagnation of business, and the consequent suffering of all classes, did not admit of their being entirely neglectresolved that the bill should be read a second time, by a ed. A petition from the merchants of London, presented majority of twenty-eight, in a house of two hundred and by Mr Baring, elicited an animated and instructive diseighteen. The divorce clause was warmly attacked in the cussion of the causes and remedies of mercantile distress, but without leading to any result. The subject was resumed on the 11th, when a petition was presented from Birmingham, but with as little effect. On the 16th Lord Stanhope called the attention of the Lords to the distress of the working classes, and moved for a committee " to inquire into the best means of giving employment to the poor, especially in the manufacturing districts." Lord Liverpool exposed in the most lucid manner the visionary nature of the schemes suggested by Lord Stanhope, and the motion was negatived without a division. The Marquis of Lansdown's motion on the 26th, for a committee to inquire into the means of extending the foreign commerce of the country, which was agreed to, drew from Lord Liverpool an exposition of his views of commercial journments. No sooner had the bill been thrown out than policy. He insisted upon the necessity of adopting a comprehensive system, and adhering to it; remarked that the fewer laws there were, the better; disapproved of the views adjourned. There was a call of the house for that day, adopted by those who represented the interests of the farmer and the manufacturer as adverse; and, after propounding many excellent principles, and protesting against their practical application, came to the conclusion that there was no harm in inquiry, but great danger in action. On message before the meeting of the Lords. At one o'clock the motion of Mr Baring, a similar committee was appointed by the Commons on the 5th of June. The first report of Lord Lansdown's committee was presented on the 3d of July. It was confined to an inquiry into the state of the timber trade, and an investigation of the means of its improvement. A motion made by Lord Milton the same evening in the House of Commons, for repealing the duty on the importation of foreign wool, was negatived without a division.

The distress was not confined to the manufacturers; for man!" "Withdraw!" were vociferated from fifty throats. the table of the House of Commons groaned beneath a

George IV. on the 30th of May, that they be referred to a select comthe country gentlemen were at stake, and, notwithstanding the earnest opposition of ministers, a majority of twenty-nine determined in favour of a committee. Mr Baring moved an adjournment of the house, in order that the committee might be appointed at a time when there was a full attendance. Mr Robinson (president of the board of trade) proposed next evening, with a view to neutralize the effect of Mr Sumner's motion, that the labours of the committee should be restricted to devising means for the prevention of frauds in striking the averages under the corn laws of 1815. This motion was carried by a majority of a hundred and twenty-three. When Mr H. Sumner presented the report of the committee on the 8th of July, he complained of the narrow limits within which the inquiries of the committee had been restricted, and expressed his conviction, that unless much more was done for the agricultural interest, the difficulties under which it laboured must ultimately prove overwhelming. Mr Western added, that the committee had recommended a new mode of taking the averages, but that it was one which would rather facilitate than retard the opening of the ports.

> The only other important discussions in parliament during this agitated year regarded parliamentary and financial reform, and the education of the poor. To the firstmentioned head belongs the fate of a bill passed by the Commons for suspending the issue of writs to four boroughs convicted of corrupt practices, and which was allowed to fall to the ground in the Lords, not having reached a second reading at the time when parliament was dissolved. Lord John Russell's bill for the disfranchisement of Grampound was read the first and second time on the 9th and 17th of May. Lord Castlereagh and Mr Canning attacked with much inveteracy the clause which proposed to transfer the franchise to the town of Leeds, on the ground that this would be "to admit all that had been urged on the question of parliamentary reform." On the 25th of May Lord Archibald Hamilton called the attention of the house to the absurd and unjust system by which, in Scotland, the right of voting had been detached from the possession of the soil. He intimated an intention of submitting a measure to restore the franchise to the real landowners, continuing their votes to all such as now possessed them. Under the head of finance we may class the attack made by Mr Brougham on the droits of admiralty. In an eloquent speech he demonstrated that the property claimed in that fund by the crown was unwarranted by the constitution; dangerous to the liberties of the subject, since parliament had no control over it; an inducement to the piratical commencement of hostilities, without a declaration of war; and burdensome in the highest degree. Mr Canning spoke at great length, but adduced only one argument. "The system of the civil list was more adapted to a monarchical constitution than that of the American government could be; and he would not be induced by any pecuniary temptation to the sovereign, to strip off trappings which were neither costly to the people nor dangerous to the constitution." Sir James Mackintosh and other eminent members of the opposition argued on Mr Brougham's side of the question at great length; but the only other speaker of the ministerial party was the chancellor of the exchequer, who contented himself with pointing out some discrepancies of opinion among his antagonists. Mr Brougham's motion was lost by a majority of a hundred and eighteen.

We have now arrived at the last topic which we indicated as having in the course of the year 1820 occupied the attention of the House of Commons. On the 28th

Reign of load of agricultural petitions. Mr Holme Sumner moved, of June Mr Brougham moved for leave to bring in a bill Reign of for the better education of the poor in England and Wales. George IV mittee to examine and report on them. The interests of He stated that there were, in the endowed and unendowed schools of England, means of educating six hundred and fifty-five thousand children; and that taking the whole children of the kingdom as one ninth or one tenth of the population, this provision would suffice for no more than one fourteenth or one fifteenth of their number. But from this six hundred and fifty-five thousand were to be deducted thirty-three thousand who were at dames' schools, where they learnt next to nothing; a deduction which would reduce the number educated to one sixteenth. Previous to the establishment of schools under the Bell and Lancaster system, it was only one twentieth. There were three thousand five hundred parishes in England without schools. The proportion educated varied in the different counties from one forty-sixth to one eighth. It was found that crime kept pace with the want of education. Mr Brougham's bill embraced four objects;—the foundation of schools; the appointment and removal of masters; the admission of scholars; and the improvement of the old education endowments. According to the ratio of schools in the county of Devon, the total outfit would be eight hundred and fifty thousand pounds; according to that of Cumberland, only four hundred thousand pounds. The annual expense might average a hundred thousand pounds. The motion having been agreed to, Mr Brougham brought in his bill on the 8th of July.

1821.

During the closing months of the year the queen continued the great object of attention, and the press laboured incessantly to keep up the excitement. The Whigs and reformers, encouraged by the popular feeling which was thus excited against ministers, again put themselves in motion. Meetings were held in different parts of the country, at which strong resolutions were adopted respecting the necessity of a reform in parliament. In this temper of the country the legislative session of 1821 commenced on the 23d of January.

The opening speech from the throne was eminently vague and unsatisfactory. The only allusion to the revolutions in Spain, Portugal, and Naples, consisted of an assurance that the country continued at peace with foreign powers, and an expressed determination, should the events in Italy lead to hostilities, to preserve this country from participation in them. The truth was, that Lord Castlereagh had committed himself with the allied sovereigns more than the spirit of the country could tolerate; and the only course left open for ministers was, to profess a strict neutrality, even between opposing principles. About the opening of the session a circular dispatch to his majesty's ministers at different courts, disavowing, on the part of Great Britain, any participation in the plans of the allies, dated the 19th of January 1821, was communicated to both houses. This document was by no means satisfactory to the opposition. Lord Grey moved, on the 19th of February, for the production of all the communications between the British government and that of Naples relative to the late occurrences in that kingdom. The noble earl maintained that " England, by assuming the tone of neutrality at the moment she did, gave her tacit approbation to the conduct of Austria." The ministers asserted the right of an independent nation to regulate its own government, but admitted the case of Naples to be an exception. The Earl of Liverpool affirmed, that the document already submitted to the house afforded sufficient evidence of the good faith of government towards Naples; and the motion was ultimately negatived without a division. Lord Grey's motion was followed up by one on the part of Lord Lansdown on the 2d of March. His lordship proposed to thank the king for laying before the house copies of the dispatch to

Reign of his majesty's ministers at foreign courts; to express the sa-George IV. tisfaction felt by the house at his majesty's refusing to participate in the designs of the allied sovereigns; and to intimate its earnest hope that his majesty would exert his influence with the allied powers to prevent or repair the consequences of measures which might eventually disturb the tranquillity of Europe, and which threatened the independence of sovereigns and the security of nations. Lord Liverpool condemned the principles of the allies; but maintained that England had no right to prescribe a rule of conduct to Austria, and that it was unwise to remonstrate when we were not prepared to enforce our suggestions by arms. The result of the debate was a majority of forty-seven in favour of ministers. A like series of hostile attacks were made almost simultaneously upon ministers in the House of Commons. The motion of Sir James Mackintosh for the papers called for by Lord Grey was made and negatived on the 21st of February. The only novelty in the ministerial defence was Lord Castlereagh's assertion, that the declaration emitted by the allied sovereigns assembled at Troppau did not contain their final determination. The event has not borne his lordship out in this assertion. The motion was negatived by a considerable majority. The pretext laid hold of for resuming the discussion in the Commons differed from that of Lord Lansdown. Sir Robert Wilson moved, on the 20th of March, for the production of a letter from the English ambassador Sir William A'Court to the Neapolitan minister for foreign affairs, in which it was declared that England intended to remain neutral, unless interference "should be rendered indispensable by any personal insults or danger to which the royal family may be exposed." Sir Robert maintained that the right claimed to interfere if the royal family of Naples were exposed to personal insult or danger, was incompatible with the rights of independent nations. Ministers contended that the interpretation of Sir William A'Court's letter was strained and unjust. The motion was subsequently withdrawn. Here the matter rested till after the breaking up of the congress of Laybach. The final declaration of its members, that "useful or necessary changes in legislation, and in the administration of states, ought only to emanate from the free will, the intelligent and well-weighed conviction of those whom God hath rendered responsible for power,"—and that they regarded " as legally null, and as disavowed by the principles which constitute the public right of Europe, all pretended reforms operated by revolt and open hostility,"was regarded by the whole English nation as directly condemnatory of its constitution, and subversive of the independence of all nations. Mr Hutchinson attacked ministers on the 20th of June for their tame acquiescence in the monstrous doctrines promulgated by the despots of the Continent, and proposed an address to the throne, calling upon the king to assume an attitude of more determined opposition to the introduction of new principles into the laws of nations, which, if acted upon," would not only prevent the establishment of all rational liberty, but tend to render perpetual despotisms of the worst kind." The motion was negatived by a large majority, on the ground that the circular of the 19th of January sufficiently expressed the views entertained on these points by the English nation. A yet stronger indication of the feeling of of the Roman Catholics, ought to be repealed; that the the country on this point was given to ministers next day, word "spiritual," which occurred in the oaths of supre-when one of their most influential and strenuous support- macy, should be declared to import merely "that the ers, Mr Stuart Wortley, in moving for copies of the declaration issued by the courts of Russia, Prussia, and Austria, and of the circular dispatch published at Laybach on the 12th of May 1821, called upon the house to express strong- the stubborn and evil doer;" that the act of repeal and ly and markedly its disapprobation of the principles ad- explanation should be accompanied with such exceptions

Castlereagh had by this time succeeded, on the death of Reign of his father, to the paternal title) opposed to this motion George IV his never-failing answer, that it was unnecessary. "The declaration of the 19th of January had announced to the world our dissent from the principles acted upon at Troppau and Laybach, and no good could result from engag-ing in a war of state papers." Mr Wortley's motion was accordingly negatived. The only other discussions respecting the foreign policy of Britain which occurred during the year 1821 were, an address from both houses of parliament to the throne on the state of the slave-trade, agreed to without the sanction of ministers, but likewise without any active opposition on their part; and Mr Hume's motion for inquiry into the conduct of Sir Thomas Maitland, the lord high commissioner of the Ionian Islands, which was negatived.

The speech glanced at the internal affairs of the nation in a manner quite as unsatisfactory as that in which it treated foreign relations. Several branches of manufactures and commerce were said to have improved, and the amount of revenue to have increased, avowedly from new taxes. The speech concluded with an expression of confidence in the popular attachment to the king's person and government, and an exhortation to preserve respect for established institutions. The opposition, still much inferior in numbers to the ministerial adherents, but strong in its reliance upon the popular feeling, and encouraged by the wavering allegiance of the country gentlemen, whose sufferings had led them to doubt the infallibility of the party to which they had hitherto adhered, made no hostile demonstrations upon the moving of the address, which, as usual, was a mere echo of the speech. It scarcely allowed, however, a day to elapse before it commenced a series of attacks upon the whole system of ministerial policy. The session of 1821 was one of unintermitting hostilities directed against ministers in every department, the administration preserving in almost every instance the attitude of defence.

The first question started by the members of opposition was one of constitutional reform. With considerable tact they selected one, upon the merits of which the ministerial phalanx, nay the cabinet itself, was known to be divided in opinion, namely, that of Catholic emancipation. By this arrangement they secured a prospect of disturbing, in some measure, the harmony of their adversaries, and at the same time exposed themselves to less unanimous hostility in the opening of their campaign. Mr Plunkett moved, on the 28th of February, that the state of the laws affecting Roman Catholics be taken into consideration by a committee of the whole house. Mr Peel stood forward as the champion of the party opposed to concession, and the members of that party mustered in strength; but the motion was carried by a majority of six. On the 2d of March the house accordingly resolved itself into a committee for the purpose of taking into consideration the Catholic claims. Mr Plunkett was prepared to prosecute his advantage, and submitted six resolutions for the adoption of the house. Their purport was, that such parts of the oaths required to be taken by persons qualifying for the enjoyment of offices, franchises, and civil rights, as merely disclaimed a belief in the speculative religious opinions kings of this realm should govern all estates and degrees committed to their charge by God, whether they be ecclesiastical or temporal, and restrain, with the civil sword, vanced in these documents. Lord Londonderry (Lord and regulations as might be found necessary for preserv-

Reign of ing the Protestant succession to the crown, and maintain-George IV. ing inviolate the Protestant episcopal church of Ireland and the church of Scotland. The resolutions were agreed to pro forma, and leave given to bring in a bill founded on them. Mr Peel declared his determination to oppose the measure in all its stages. Mr Plunkett digested his scheme into two bills, the one containing the civil, the other the spiritual arrangements, which it was proposed to pass into a law. They were read a first time, without discussion, on the 7th of March. An attempt was made on the part of the opponents to concession, aided by some discontented members of the Catholic church, to represent the measure as odious to the class of the community whose enfranchisement it contemplated, but without success. Various amendments, calculated to defeat the object in view, were proposed by Messrs Bankes, Peel, and Goulburn, but successfully combated. Sir John Newport, when moving the commitment of the bills on the 26th of March, gave notice of his intention to move their consolidation; and on the 28th his motion was submitted and agreed to. The consolidated bill, notwithstanding the strenuous opposition which it encountered from the high church party within the house, and latterly from the Catholic clergy without, passed the Commons on the 2d of April by a majority of nineteen. It was accordingly carried to the House of Lords and read a first time without any debate, but ultimately thrown out on the 16th of April, upon the motion that it be read a second time, by a majority of thirty-nine.

The support given by the house to this effort for the relief of the Catholics, and the loud cry of the country for parliamentary reform, encouraged opposition to moot that question, upon which every rational hope of amelioration in church and state depended. Mr Lambton was first in the field. He submitted a plan of reform to the consideration of the House, the very evening that the Catholic relief bill was rejected by the Lords. The principal features of the measure which he contemplated were, the limitation of the duration of parliament to three years; the extension of the elective franchise to all persons possessing property, however small in value, which contributed to taxation; and the abolition of rotten boroughs. The attendance was thin and the debate languid, although adjourned on the first evening. It was resumed on the 17th, but abruptly terminated by a manœuvre of the ministerial party. Mr Lambton and his friends were rather late of appearing, and their antagonists taking advantage of their absence, instead of prosecuting the discussion, called for the vote, and thus defeated the wish of the reformers to go into committee. Such a stratagem was more worthy of a knot of mischievous school-boys than of men deliberating upon the interests of the empire; yet the skilful employment of the result by the ministerial press succeeded for a considerable time in alienating the public confidence from MrLambton, and neutralising his utility in parliament. The opposition were disappointed by this result, but not defeated. Lord John Russell re-introduced the subject on the 9th of May, in a more indefinite shape; several members having declared, on the occasion of Mr Lambton's motion, that they were ready to entertain the general question of reform, although they objected to the specific measure proposed. Lord John proposed for the adoption of the house four resolutions, declaratory of the corrupt state of the elective system; the necessity of extending the elective franchise to wealthy and populous places hitherto unrepresented; the propriety of appointing a select committee to consider the best measure of effecting this innovation; and the expediency of referring to the same committee the consideration of the best mode of proceeding against such boroughs as should in future be convicted of bribery

and corruption. The first resolution was lost by a majori- Reign of ty of thirty-one, in a house consisting of two hundred and George IV seventy-nine members: the others were negatived without a division. The last attempt made during the session for the attainment of a general reform, was Mr H. G. Bennet's motion for leave to bring in a bill for the better securing of the independence of parliament. His plan was to continue to the great officers of government their seats in the house, but to exclude clerks and underlings. Of fifty-one persons holding seats in the house at the pleasure of government he proposed to exclude twenty-nine. This motion was negatived like the rest. On the 10th of May, Lord Archibald Hamilton made an attempt to induce the house to pledge itself that it would next session take into consideration the state of representation in the counties of Scotland, but without success. The only instance in which the cause of reform was at all successful during the lapse of this session, was the passing of the bill for the disfranchisement of Grampound. Even this slender victory was incomplete in itself. The bill, as agreed to by the Commons, transferred the franchise which Grampound was declared to have forfeited to Leeds, vesting the electoral qualification in all the inhabitants renting houses at L.20 yearly. Lord Liverpool moved in the House of Lords, that, instead of giving two representatives to Leeds, the whole county of York should in future be allowed the privilege of returning four. The amendment was agreed to; and the House of Commons decided that the measure, even in its mutilated state, was not to be rejected.

While these two great constitutional questions were thus keenly contested, Mr Hume kept up a continual fire upon the ministerial system of finance. He opened his battery with the first introduction of the estimates. When the army estimates were introduced, he directed the attention of the house to the enormous augmentation of the numbers of the army on the peace establishment which had taken place since 1792, and the corresponding increase of expenditure; and proposed that the resolution recommended by the finance committee of 1817 of approximating the military establishment as near as possible to that of 1792, should be adopted. The motion was negatived. Nothing daunted by defeat, Mr Hume returned to the attack on the production of the navy estimates. His motion was similar to that which he had brought forward in regard to the army; and, resting upon the same principles, it was not pressed to a division. A motion by the same gentleman, on the production of the ordnance estimates, in which he urged, in addition to a statement similar to those made on the former occasions, a transgression by this department of the orders of the house, was equally unfortunate. In his resolutions respecting a possible saving in the collection of the land and assessed taxes, he was more successful. The ministers did not dare to meet him, as they had the year before, with a direct negative; but suggested a reference to a committee, in which Mr Hume acquiesced. The chancellor of the exchequer brought forward the budget on the 1st of June. The amount of supply he estimated at L.20,018,200; of ways and means at L.20,031,569. He sought to make it appear that a reduction of ten millions had been effected on the national expenditure since 1820. Mr Hume was again at his post, and recapitulated, with new illustrations and calculations, the arguments he had already adduced in opposition to each particular estimate. He concluded by moving an address to the king, requesting that his majesty would be pleased to direct a minute investigation into the expense of the management and collection of the revenue; a careful revision and adjustment of all salaries and allowances; and the exercise of a vigilant superintendence over the expenditure of the country,

Reign of especially in everything connected with the military esta- isting system. Their general object was clearly to calcu- Reign of George IV. blishment. The ministry, in order to avoid the disagreeable necessity of adopting a suggestion from Mr Hume, moved an amendment, differing from the original motion in nothing but its more courtly tone, and its vagueness of expression. A resolution similar to Mr Hume's was submitted to the Peers by Lord Darnley on the 2d of July, and evaded in the same manner. During the time that this extended plan of financial reform continued to be pressed upon a reluctant ministry, the country gentlemen were busy striving to shift as large a proportion of the national burdens off their own shoulders as possible. Mr Western attempted to introduce a bill for repealing the additional duties imposed on malt in 1819; and Mr Curwen succeeded in obtaining a repeal of the tax imposed on horses employed in agriculture.

All attempts to shake the attachment of the majorities in both houses to the ministry, or give such a voice to the nation as might deprive its supporters of their seats, having failed, the ameliorations in our legal institutions so warmly desired by all friends of humanity and justice made but slow Their bigoted adversaries still maintained an ascendency in the cabinet. Sir James Mackintosh brought forward three bills;—for abrogating capital punishment in certain cases of forgery, and in cases of stealing in dwelling-houses, and on navigable rivers. The first, after having been thrice read in the Commons, was thrown out, in consequence of a manœuvre of Lord Londonderry on the question that it do pass. The second and third were carried through the lower house, but thrown out in the Lords. Another attempt to humanize the criminal code was made by Mr Martin of Galway, who introduced a bill for allowing the benefit of counsel to persons accused of felony; but on the second reading it was negatived without a division. Mr Kennedy directed the attention of the house to the faulty mode of constituting juries in Scotland; but the hostility of government and the Scottish law officers to any improvement was so marked, that he forbore to press his measure for remedying the defect. Sir John Newport submitted a series of resolutions to the House of Commons, complaining of the dilatory proceedings of the commission appointed in 1815 to inquire into the state of the English courts of justice. The resolutions were negatived, the ministers taking upon themselves the defence of their nominees. Although the party in power thus strenuously opposed in parliament every modification of the laws, their adherents out of doors hesitated not to appoint officers not recognised by the constitution, to watch ever the strenuous enforcement of the law of libel. An association was formed in London on the 12th of December 1820 for the purpose of suppressing seditious publications; and bills of indictment were preferred by the law agent of this body against several booksellers. Mr Brougham took an opportunity of directing the attention of the house to its proceedings; insisting strongly on the dangerous character of men associated to prosecute individuals selected at the discretion of political prejudice. He contended, likewise, that such a union had a tendency to destroy the impartiality of juries. The subject was again brought before the house by Mr S. Whitbread. No conclusion was come to; but the society, after being thus held up to public reprobation, languished and died.

The attention of the house was this year again directed to the continued distress both of the agricultural and manufacturing population. The committee appointed in 1820 to investigate the mode of striking the corn averages, reported immediately upon the sitting of parliament. In consequence of the recommendation contained in the rewhich considerable changes were effected in the then ex- matters were still worse. The distress there was even more

late the averages so as to diminish them in apparent George IV. amount; in other words, to raise the importation price. Not contented with this arrangement, the country gentlemen made another and successful attempt on the 7th of March, to obtain the appointment of a committee to take into consideration the petitions relative to the distress of the agricultural interest. The committee reported, on the 18th of June, that the agricultural suffering was mainly owing to the change in the currency; that it would decrease as contracts, and prices, and wages of labour, assimilated themselves to the new value of money; and that considerable progress had already been made towards this desirable consummation. All interference on the part of the legislature was deprecated. Mr Curwen suggested the imposition of a duty on the transfer of stock, and Mr Baring adverted to the expediency of allowing the bank to pay either in gold or silver; but neither of these gentlemen pressed the adoption of any measure. With a view to alleviate the depressed state of commerce and manufactures, committees were appointed by both houses to inquire into the regulations affecting our foreign trade, and how far benefit might accrue from modifying them. Lords' committee reported on the 11th of April, confining its attention to the advantages likely to be derived from an extension of the Asiatic trade. All the suggestions of the report were consequently in a great measure at the mercy of the East India Company. The report submitted to the Commons by their committee related to the intercourse with the Baltic, and was followed up by a resolution declaring the expediency of diminishing the preferences given to the colonial timber trade over that from the north of Europe, allowing that of Russia and Prussia superior advantages over the timber of Norway. This paltry advance in liberality was with difficulty carried into a law. A more important step, suggested by the committee, was the leave granted by the house to introduce bills for the amendment of the navigation laws; a measure which was allowed to stand over till next session.

While these important debates were agitating the legislature and the country, the monarch was engrossed with the gorgeous pageantry of his coronation, and pleasure excursions to Ireland and to Hanover. All three entailed a great expense upon the country, and not one of them was rendered conducive to any useful purpose. Devolving upon other shoulders the cares of state, George IV. would have led a life of unalloyed ease, but for that thorn in his side, the queen. Her safety once assured, and an allowance settled upon her by parliament, she naturally ceased to have any interest for the public, which had been led to espouse her cause from a conviction of the injustice with which she had been treated, not from any personal attachment, which her character was but ill qualified to inspire. She made one last desperate effort to regain her notoriety, which was rapidly subsiding at the time of the coronation; but failing in her attempt, she was seized with such chagrin that she soon afterwards died. Her death in some measure re-awakened the national sympathy; and an attempt on the part of the ministers to interfere with an expression of respect to her remains increased the unpopularity of the sovereign.

The aspect of affairs at the commencement of 1822 was stormy in the extreme. The distresses of the agriculturists continued unmitigated; and meetings of farmers and landholders, clamorous for assistance, were held in every county. One called for corn laws, another for the abolition of tithes, and another for a reduction of the national debt. Each thought his own remedy sufficient, and port, a bill was introduced on the 26th of February, by refused to listen to the suggestions of others. In Ireland

1822.

George IV.

Reign of overwhelming than in England, owing to a redundant population, and the absence of any variety of employments. The pressure of tithes, ever odious to the Irish peasant, as a tax levied for the support of a heretical church, and of an unjustly apportioned local taxation, bore down the population, and embittered their spirit. Men's minds were, moreover, even in times of prosperity, alienated by bitter theological feuds. The increasing strictness of the precautions taken by government against smuggling had driven many lawless men into the mountainous district in the northern baronies of the county of Cork, and in Kerry; and there, accordingly, the most extensive and seemingly organised devastations were perpetrated. The flame, it is true, broke out at intervals over the whole of Ireland, but in that district was its head-quarters.

Under these inauspicious circumstances parliament assembled on the 5th of February. In the House of Commons, the ministerial party, which had never quite recovered the secession of Mr Canning from office at the time of the queen's trial, was strengthened by the appointment of Mr Peel to be home secretary. In both houses its Grenville party, some of whom accepted of office.

The theme most emphatically dwelt upon in the speech from the throne, and first submitted to the attention of parliament by ministers, was the state of Ireland. Lord Castlereagh and his coadjutors had only one remedy for the disturbances of that country—coercion. Two bills were immediately introduced into the Commons, and with the most indecent haste hurried both through that house and the Peers, receiving the royal assent on the 11th of February. The first contained a re-enactment of the insurrection act, empowering any two justices to cause an extraordinary session of the peace to be held, and the justices, when assembled in such session, to the number of seven in a county and three in a city, to signify to the lord-lieutenant their opinion that the county was in a state of disturbance, assigning at the same time their reasons, and praying him to proclaim it. The proclamation which the lord-lieutenant was empowered to issue warned the inhabitants of the disturbed district after a certain day to remain within their houses between sunset and sunrise. After that day any justice of peace, or any person authorized by his warrant, might enter into any house in the proclaimed district between one hour after sunset and sunrise, and give orders for the apprehension of such of hours, all persons having in their possession offensive arms, all persons not travellers or inmates found assembled after nine at night and before six in the morning, in any house where malt and spirituous liquors were sold, and a mulcourt of special sessions, to be held within seven days from the date of the proclamation, and prolonged by adjournments as long as the district continued proclaimed. Dispersing seditious papers was declared punishable by twelve months' imprisonment, and all other offences specified in the act, by transportation for seven years. This strong measure was enforced by the second bill, which suspended the habeas corpus act. The operation of both acts was limited to the first of August following opposition arrayed against these enactments was vehement, but not numerous. The more timid Whigs palliated their acquiescence by their confidence in the character of Lord Wellesley, who was then lord-ligutenant. Two other measures were shortly after introduced, and carried through parliament by the 11th of March. The first was an act to indemnify all persons who, since the first of November preceding, had, with a view to the preservation of omission of some of the most obnoxious details.

peace, but without legal authority, seized arms or gun- Reign of powder; the second imposed severe restrictions on the George IV. importation of arms and ammunition into Ireland, on the manufacturing of these articles in the country; and also on the removal of them from one place to another. The bills passed through both houses without observation.

The additional powers conferred by these acts were vigorously exercised by the Irish government. Every district in which an act of violence occurred was immediately proclaimed. The whole country was patrolled by large bodies of military and police. Special sessions were held for the purpose of putting the laws into immediate execution. At Cork alone there was a calendar of three hundred and sixty-six offenders, of whom thirty-five received sentence of death. The regular assizes soon followed, at which similar scenes were repeated. The most worthless testimony was lightly credited by terrified jurors. But all this vigilance, although it succeeded in rendering resistance to the constituted authorities less daring and systematic, failed to give peace to Ireland. The country continued in a state of feverish insecurity, and violence extended numbers had been increased by an amalgamation with the its sphere of action. As the spring advanced, however, and the nights shortened, outrages diminished in number; and a famine which ensued, accompanied in many places by a virulent typhus fever, the result of bad and insufficient diet, effectually tamed the spirit of insubordination. The humanity of England was awakened, and great exertions were made to relieve the sufferers, but not until their misery had almost exceeded what human nature, if untried, could be conceived capable of enduring.

On the 8th of July a bill was introduced by Mr Goulburn, prolonging the duration of the insurrection act, and the suspension of the habeas corpus, till the 1st of August 1823. A feeble opposition was offered to it. Only seventeen voted against the principle of the measure in the Commons, whilst in the House of Lords it was suffered to pass almost without remark. A more permanent measure of coercion was introduced at the same time. By the constabulary act, the lord-lieutenant was empowered to appoint, by warrant under his own hand, a chief constable for every barony, or division of a barony; and to require by his proclamation the county magistrates to appoint constables and sub-constables at the rate of sixteen to a barony. If the magistrates did not obey the proclamation within fourteen days, the lord-lieutenant was to appoint the constables himself. The chief constable was to have the inhabitants as were found absent. These, along with a house provided for him, and a salary not exceeding all persons found out of their abodes between the same L.100 per annum; the salaries of the others were not to exceed L.35 a year. The lord-lieutenant was likewise authorized to nominate superintendents or inspectors of the chief constables and constables, with salaries of L.500 a year. By a clause of this act, his lordship was authotitude of others, were to be tried without a jury, by a rized, upon application from seven or more justices, to appoint a resident magistrate for any district, possessing all the powers of a justice of the peace, bound not to leave his district except in the prosecution of his official duty, and obliged to make monthly returns of the state of the country within his jurisdiction. This official was to enjoy an annual salary not exceeding L.500, and a house and furniture not exceeding L.200. A keen opposition was offered to this enactment. It was alleged that it entailed an enormous expense on the country; that it was unconstitutional, and would prove ineffective. These arguments received additional weight from the quarter whence they came. Mr Charles Grant, a strenuous partizan of ministers, and who had governed Ireland for three years with great prudence and popularity, was the person who urged them with most energy. The utmost concession, however, that could be wrung from ministers was the 1823.

and the clamour of Orange partizanship effectually drowngun, and almost completed during Mr Grant's secretaryship. The task was one of infinite labour, and its completion required both time and caution. The new list was completed by the end of 1820, and the commissions issued. The change proved great. In seven counties alone no fewer than two hundred noblemen and gentlemen had these parties was directed against Lord Wellesley. On jected by the Lords. the 4th of November his lordship yet further offended the zealots of the Protestant ascendency, by his prevention of the annual insult offered to their Catholic countrymen. The press teemed with libels against his person on the 14th of December, he was received with every expression of dislike, and some manifestations of violence.

and their remedies, which engrossed the legislature, the important question of a general reform of the representative system continued to be forced upon its attention. Petiin the Commons, " that the present state of the represenand, referring to his approaching departure for India, con-That the noble lord will carry his motion this evening, I have no fear; but with the talents he has shown himpresume not to expect that he will give any weight to obthe question of parliamentary reform, while I conjure the himself to pause before he again presses it upon the country. If, however, he shall persevere, and if his perseverance shall be successful, and if the results of that success shall be such as I cannot help apprehending, his be the triumph to have precipitated these results, be mine the consolation, that to the utmost and latest of my power I have opposed them." Mr Canning seems to have had a prophetic consciousness of the approaching dissolution of ness justified by the division. Only a hundred and sixtyfour voted for Lord John's motion, and two hundred and sixty-nine against it; but the ranks of the minority were swelled by the heirs of the noblest families in Britain, whose talents and energy promised an immense accession of force on every future occasion. This attack was followed up on the 24th of June by another, in the form of a resolution, proposed by Mr Brougham, "that the inof its due prerogatives, destructive of the independence of reform. A languid debate ensued, which terminated in a tractors a fixed annuity for forty-five years; in return for

The only attempt made this year in favour of the Catholics was Mr Canning's bill for the admission of Catholic peers to the right of sitting and voting in the House of Lords. The idea of this measure had originated with Mr Canning, and was not unsuited to the character of his writs of supersedeas directed to them. The whole fury of mind. The bill passed the Commons, but was of course re-

The most serious opposition against which ministers were this year called to contend, was in the matter of finance. Mr Hume renewed his detailed attacks upon every item of the estimates and budget, and, although he and government; and when he appeared in the theatre failed in effecting any immediate change, kept alive the public attention, and rendered government more cautious and attentive. In other efforts Mr Hume and his coad-Amid the anxious discussions on these local disturbances jutors were yet more successful. Ministers announced, as the whole amount of their projected alleviation of national burdens, the repeal of the malt tax, which produced nearly a million and a half per annum. With a view to tions on that subject were presented from most of the force them to do what they refused to undertake sponlarge towns and important counties of the empire. On taneously, Mr Calcraft on the 28th of February brought the 29th of April, accordingly, Lord John Russell moved forward a motion for the progressive repeal of the salt tax, by taking off one third of the duty in each of the tation of the people in parliament required the most se-rious consideration of the house." His lordship did not jority of only four in favour of ministers. Next day they propose any specific plan, but indicated one or two which received a still more effectual lesson. Tonnage duty	150,000
Irish window and hearth taxes	250,000

£3,500,000

that system to which he had yoked himself; a conscious- But the severest wound received by the financial reputation of ministers was inflicted by the hands of the chancellor of the exchequer. Mr Vansittart undertook two great financial operations; the one with a view to diminish permanently the charge of the public debt, the other to diminish part of the annual expense of government. The first was the reduction of the navy five per cents. to four per cent. Some objections were stated to the manner in which this object was proposed to be attained; but the fluence of the crown is unnecessary to the maintenance advantage was too apparent, and Mr Vansittart's plan obtained the assent of parliament. His other scheme, how-ever, proved a singular failure. The amount of naval and parliament, and inconsistent with the good government of ever, proved a singular failure. The amount of naval and the state." The mover intimated, on the conclusion of his military pensions was about five millions annually. The speech, that he considered his resolution, if adopted by chancellor of the exchequer proposed to provide for this the house, as nothing less than a pledge to parliamentary branch of public expenditure by granting to certain con-

sum in each of the forty-five years as should upon calculation be sufficient to pay the pensions that should then be in existence. The scheme was, in other words, to contract now for annual loans to be advanced to government in each of the next fifteen years, and to be repaid by a gradually increasing annuity, to commence at the end of fifteen years, and continue for thirty years from that time. This new mode of loan was improvident and grossly unjust, as tending to throw the whole load of the burden on posterity. It was attacked by Mr Ricardo and Mr Brougham with the most biting sarcasm, but nevertheless most pertinaciously forced, with the whole strength of the ministerial phalanx, through both houses. A fate awaited it, however, compared with which Mr Brougham's withering sneer was gross flattery: not one capitalist could be found to engage in the contract. The prudence of the monied men saved the minister from the effects of his own imbecility. He again submitted his scheme to the House of Commons in a form so modified, that the only objection to which it was liable was its intricacy and confusion. This, however, was as much the fault of the school to which he belonged, as of the individual financier.

The continued distress of the agricultural interest occupied the attention of parliament to a yet greater extent than in the preceding year. At the commencement of the session Mr Brougham submitted a resolution to the House of Commons, declaratory of the necessity of affording relief to the agriculturists by the removal of taxes. The motion was negatived, upon the declaration of Lord Londonderry that ministers had a plan of their own to propose. This plan his lordship developed on the 15th of February, when moving for the production of some financial documents. The remedies which it contemplated were the repeal of the malt-tax, already noticed, and a loan to the agricultural interest by means of exchequer bills. In order to clear the way for an exposition of this measure, the marquis moved, on the 18th of February, for the renewal of the agricultural committee. This body laid its report before the house on the 1st of April, and the same day three different schemes were submitted for the relief and protection of farmers and landlords. Lord Londonderry proposed a loan of a million to the agriculturists by means of exchequer bills, under certain circumstances; the opening of the ports to the importation of foreign grain whenever the average price of British corn exceeded a specified sum; and the subjection of the foreign grain thus admitted to certain duties. Mr Ricardo proposed no loan, but the opening of the ports, when British corn reached a specified price, to foreign grain, subjected to certain duties, and a bounty or drawback on the exportation of corn to foreign countries. Mr Huskisson's resolutions contained a narrative of the state of the British agriculturist, from which the proper method of coming to his assistance was logically deduced. His plan was a gradual repeal of the prohibitory corn laws, and the establishment of a permanently free trade in foreign grain, subject to the imposition of moderate duties. Lord Londonderry subsequently withdrew his proposal to extend a loan to the agriculturists. Mr Ricardo withdrew his resolutions, two of them, having reference to the scale of duties upon imexported, having been adopted by Mr Huskisson. The final discussion in the Commons took place on the 7th of May. Sir Thomas Lethbridge proposed a series of protecting duties, including almost every species of agricultural produce, down to apples and pears, which re-

which they were to pay into the public treasury such a tions were agreed to; and a bill founded upon them pass- Reign of ed into a law, against which Lords Lauderdale and Ers-George IV. kine entered a protest. 1823.

The commercial interest likewise attracted a considerable portion of the attention of the legislature, although, as there was on this point less difference of opinion, the debates were less noisy. The mania for speculating in foreign funds, which had begun to show itself so early as 1817, reached its height, and experienced its first check, this year. The Colombian bonds received the first shock. The depression of Spanish stock followed. A series of panics convulsed every money market in Europe. The price of all foreign stocks fell rapidly, and thousands were ruined or impoverished by the change. Nevertheless it appeared, by returns from the manufacturing districts, procured by the secretary for the home department, and laid upon the table of the House of Commons, that the rate of profits, although low, was sufficient to induce persons to enter into trade; and that in most places the operatives were fully employed. The plans announced by Mr Wallace in the preceding session of parliament, for benefiting the commerce of the country, were this year carried into effect by means of five acts. The first repealed all the acts affecting navigation and commerce passed by British parliaments previous to the enactment of the navigation laws under Charles II. The second repealed the third clause of the navigation law, which enacted, that no goods of the growth, product, or manufacture of Asia, Africa, or America, shall be imported into England, but in such ships as do truly belong to English people, and are navigated by a master and three parts English mariners; the fourth, which enacts that no goods or commodities of foreign growth, production, or manufacture, which shall be brought into England otherwise than in ships built and navigated as above, shall be shipped from any other place but the place of their growth, production, or manufacture, or from those parts where they can only be or usually have been brought; the eighth, which relates to the importation of goods from Turkey and from Russia; the twelfth and fourteenth, which relate to the importation of goods from the Levant, from Spain, and Portugal, and their dependencies; and all acts from the time of Charles II. downwards, which stood in the way of the provisions contained in the third act. This statute established the principle of the old navigation laws, but with important modifications. Foreign ships were allowed to bring enumerated goods from any port in Europe, provided the ship belonged to the port in question. The ships of Holland, so long the objects of a pitiful jealousy, were allowed the same privileges with those of the rest of Europe. Goods of any country or place in South America or the West Indies, belonging to, or which had belonged to Spain, might be imported direct from the place of growth, in ships of the country. No importation was permitted from any port where British ships were not admitted. The fourth act regulated the trade between the British possessions in America and the West Indies, and other places in America and the West Indies; and the fifth between the same colonies and the rest of the world. The object of the two last-mentioned laws was to benefit the West India planter. An attempt was also made by goported grain, and the drawback upon such as should be vernment to induce the East India Company to permit ships measuring less than three hundred and fifty tons to participate in the private trade to India. But the Company stood upon its charter, and refused to comply unless the full rights of British registry were extended to India built ships, and East India sugars for home consumption ceived a very feeble support from a small minority. The admitted on equal terms with those from the West India conjoined resolutions of Mr Huskisson and Mr Ricardo colonies. Mr Hume drew the attention of the Commons were likewise negatived. Lord Londonderry's resolu- on several occasions to the exorbitant consular fees, which

a law to alleviate this evil.

The death of Lord Londonderry, which happened shortly after the prorogation of parliament, whilst the king was absent in Scotland, was eventually the cause of an essential change in the system pursued by the British government. Lord Liverpool entertained very liberal opinions in matters of commercial and international policy. His sentiments were in general shared by such members of the Grenville party and of Mr Canning's friends as were in office. Mr Peel was a minister of comprehensive mind, extensive acquirements, and a disposition that could adapt ton, with their retainers Bathurst, Westmoreland, Maryand relentless pertinacity of purpose, was the animating In opposition to its wishes, and in opposition to the king's reigns with the internal arrangements of Spain. personal dislike, Lord Liverpool installed Mr Canning into the office left vacant by the death of the Marquis of Londonderry. The new foreign secretary was further strengthened in the commencement of 1823, by the resignation of Mr Vansittart, to whose financial reputation the last session of parliament had given the finishing stroke, upon receiving a peerage and the sinecure chancellorship of the duchy of Lancaster. He was succeeded as chancellor of the exchequer by Mr Frederick Robinson. Mr Huskisson was at the same time appointed president of the board of trade; his seat in the cabinet he did not receive till a later period. A government of shifts and expedients had failed, and one of a different description was now to be tried.

The line of policy observed by government during the continuance of Mr Canning, Mr Robinson, and Mr Huskisson in office, was such as to conciliate the confidence of a large body of the people. It was indeed a material improvement upon that persisted in by Lord Londonderry and Mr Vansittart; and the nation, long unaccustomed to such a parade of liberality on the part of ministers, conceived an exaggerated idea of its excellence. To this circumstance, and to the more determined and better organized efforts of the Catholics of Ireland, which for some years shared, with questions of commercial arrangements and foreign policy, almost the exclusive attention of the public, we are to attribute the fact that, subsequent to the year 1823, the very name of parliamentary reform seemed for a time to have been forgotten. During the early part of the session of parliament in this year, the table of the House of Commons was loaded with petitions for reform. On the 24th of April Lord John Russell moved that the state of parliamentary representation required the most serious consideration of the house. The motion, however, was negatived. Lord Archibald Hamilton submitted a series of resolutions to the house on the 2d of June, descriptive of the state of county representation in Scotland, and containing a pledge of early redress. But these were no more in parliament for several years of reform, except in some futile attempts to obtain an amendment in the representation of Edinburgh.

The topic on which the discussions in parliament for the most part turned during the session of 1823 were the relations of continental Europe. Mr Canning's system was to record a protest against the doctrines of the allied sovereigns, and to endeavour to prevent any attack upon however, frankly admitted the justice of the procedure on

Reign of operated as a heavy tax upon merchandise; and govern-Spain on their part, but if possible to avoid war. A few Reign of George IV ment at last declared that the board of trade was framing days after Mr Canning's acceptance of office, the Duke of George IV days after Mr Canning's acceptance of office, the Duke of George IV Wellington left London for Vienna. The topic of deliberation at the congress appointed to be held in that city was the existing state of affairs between Russia and the Porte. That question having been disposed of, the members of the congress, with the exception of the British minister, were to have adjourned to Verona, there to sit in judgment on the Italian peninsula. It was the wish of Mr Canning that the absence of the English minister from Verona should mark England's refusal to interfere with the independence of the Italian states. The Duke of Wellington, however, being detained by indisposition, did itself to associates of any principles. The liberal incli- not reach Vienna until a few days before the proposed nations of these men were completely neutralized by the adjournment, and the urgency of affairs rendered it advisdecided ultra-toryism of Eldon, Londonderry, and Welling- able that he should follow the sovereigns to Verona. He had learned from a conversation with M. de Villèle at borough, Sidmouth, and Vansittart. Of this clique, Lon- Paris, that it was the intention of the French ministers to donderry, by his plausible manners, ready flow of language, call upon the congress to come to some decision on the relative positions of France and Spain. By Mr Canning's spirit. After his death it offered to its more enlightened instructions the Duke of Wellington opposed most vigoassociates no resistance beyond that of mere vis inertiæ. rously any interference on the part of the allied soveunexpected opposition checked them in their arbitrary projects; and the result was, that they abstained from a combined demonstration, resolving to assist France, in case of any aggression upon the part of Spain, of any outrage on the person of the king, or of any attempt to change the dynasty of that kingdom. With this resolution the congress separated, and Mr Canning's negociations for preserving the peace of Europe and the principle of national independence were adjourned to Paris.

The British envoys in that capital were amused by different pretences, from the termination of the congress in November 1822 till the 7th of April 1823, when the Duke d'Angouleme crossed the Bidassoa. According as timid or rash counsels prevailed, the French ministers expressed pacific or warlike intentions; but whatever their expressions might be, French gold and French intrigue were incessantly employed in stirring up factions in Spain. The reasons for declaring war, ultimately published by France, however frivolous, rested the justification of the matter upon a national quarrel alone, and thus precluded the interference of Britain. The popular feeling in England ran very high in favour of Spain; but the indifference manifested by the body of that nation towards the constitutional cause reconciled the country to the pacific policy of ministers.

The most embarrassing circumstance which attended these negociations was the necessity of a serious remonstrance with the Spanish ministry respecting certain aggressions perpetrated on British subjects in consequence of the disputes between Spain and her colonies. constitutional government was as averse to the recognition of colonial independence as the old despotism. Britain had, however, acquired, during the Peninsular war, a right of commerce with the Spanish South American possessions, and this she was not inclined to relinquish; while British vessels had been captured by cruizers carrying Spanish colours, under the pretext that they had infringed a nominal blockade of the provinces in a state of insurrecnegatived by a narrow majority. Nevertheless we hear tion. After various ineffectual representations, the British ministry assumed the right of redressing themselves, and sent notification of the fact to the Spanish court. It was a matter of great delicacy to press for the recognition of rights which that government could not fail to grant with reluctance, at a moment when England was the only barrier to which it could look against the encroachments of the holy alliance. The Spanish ministry,

1823.

Reign of the part of England, and the intercourse between that nery with which former sinking funds had been encum- Reign of George IV. country and Spanish America was allowed to remain upon the footing that had been established for years without any complaints on the part of the mother country. The success of the French army rendered it expedient to adopt yet more decided steps. In the month of July a number of respectable merchants connected with South America applied to the foreign office, requesting the appointment of commercial agents to protect British interests in that quarter of the world. Their prayer was granted, and consuls and consuls-general appointed to the principal stations in Mexico, Colombia, Peru, Chili, and Buenos Ayres.

The system adopted or intended to be adhered to by government in these questions of foreign policy was explicitly declared in the speech from the throne. The only complaint urged against the declaration was its coldness. Mr Canning was not at that time in parliament. Lord Liverpool's explanation of the views of ministry, and Mr Brougham's indignant denunciations of the despotic projects of the continental sovereigns, rendered his absence less felt. The Spanish question was not immediately urged by opposition, it being understood that negociations were still in progress. The diplomatic papers relative to these transactions were submitted to both houses on the 14th of April; Lord Liverpool and Mr Canning seizing the opportunity of addressing to their respective houses explanatory statements of their conduct. The opposition leaders intimated their opinion that the explanation given by ministers was by no means satisfactory; but more minute discussion was reserved for a future occasion, when members should have had time to examine the correspondence. Before that discussion occurred, Lord Althorpe moved for leave to bring in a bill for the repeal of the act prohibiting British subjects from engaging in foreign military service, or fitting out in his majesty's dominions, without the royal license, vessels for warlike purposes. It was argued in opposition, that, under existing circumstances, such an alteration of the law would operate exclusively in favour of Spain; and by means of this argument a majority of the house was influenced to negative the motion. The main question of the correctness of the ministerial measures was resumed both by the Lords and Commons a few evenings later. In both houses an address to the king was moved, expressive of regret that his majesty's ministers had not adopted a more dignified tone, and supported with more energy the cause of Spain. The universal sentiment was so apparently in favour of ministers, that the opposition endeavoured to avoid coming to a division in the House of Commons. The ministerial members, however, succeeded in forcing the house to divide, by which means they gave to the lately re-constructed ministry the sanction of an overwhelming majority.

The financial operations of the government increased the popularity which its avowed secession from the interests of the holy alliance had gained for it. The increase of the revenue enabled the new chancellor of the exchequer to commence his career with a spontaneous alleviation of national burdens. In addition to this circumstance, Mr Robinson's lucid statement of accounts, and explanation of the measures contemplated by government, contrasted most favourably with the complicated and imbecile attempts of his predecessor. Mr Robinson's calculations showed a surplus of seven millions, five of which he proposed to appropriate to the reduction of the debt, and two to the remission of taxes. The latter object was accomplished by the introduction of the necessary bills. In order to secure the former, Mr Robinson laid before parliament a bill, the purport of which was to apply an annual sum of five millions as a sinking fund, and at the same time materially to simplify the superfluous machi-

bered. Mr Maberly proposed to substitute for a sinking George IV fund, which he disapproved of as illusory, an extinction of four millions of three per cent. stock in the course of seven years, by the redemption of the land tax. It was objected that this project, as involving a necessary diminution of revenue, was totally nugatory; and it was accordingly rejected. Mr Hume fought hard for further reductions of the national burdens; but such was the popularity of ministers, that he met with less support than he had experienced on former occasions. His motion of censure against the ministry for appointing a lieutenant-general of the ordnance after that office had been declared unnecessary by the report of commissioners, was pressed to a division by Mr Canning, and negatived by a great majority. The ministers no doubt deemed it politic to meet such a

proposition by a full display of their power.

Intent upon winning golden opinions from all sorts of men, ministers exerted themselves to secure the rejection of Sir James Mackintosh's resolutions for the improvement of the criminal code, only to introduce bills of their own tending professedly to the same end. The resolutions introduced by Sir James were nine in number, and their purport was to declare the expediency of abrogating the punishment of death in the cases of most flagrant hardship; of substituting in these cases transportation for life or a term of years, or imprisonment with or without hard labour at the discretion of the judge; of making provision that sentence of death should not be pronounced in cases where there was no expectation of its being carried into effect; and of doing away with the forfeiture of goods and chattels in cases of suicide, and putting an end to the indignities offered to the remains of the dead in cases of suicide and high treason. The acts introduced in the course of the same session under the auspices of government, and passed, contained provisions to the same effect, with certain concessions to popular prejudice in the treatment of the remains of suicides. In the department of civil law some amendments were introduced into the law regulating the relations of agent and principal; a commission was appointed to inquire into the forms of process in the courts of Scotland, and into the course of appeals from the court of session; a resolution was adopted by the House of Lords to devote five days of the week instead of three to hearing appeals; and some modifications of the law for preventing clandestine marriages were wrested from its reluctant propounders. Every attempt to obtain an amendment of the court of chancery proved unavailing. The strong repugnance of Lord Eldon, and the unwillingness of the ministry to admit the existence of abuse in one of their own offices, proved insuperable obstructions.

The conduct of ministers towards Ireland was far from being marked by the same eagerness to conciliate popular affection. The violent conduct of the Orangemen necessarily embittered the spirits of the opposite faction, and acts of violence occurred even more frequently than before. Under these circumstances Lord Wellesley found himself called upon to apply for a continuation of the insurrection act, which was conceded by parliament. This anxious moment was selected by Mr Canning to hang coldly back for the first time when the question of the Catholic claims was stirred. He expressed himself averse to their discussion at that time. Mr Plunkett, however, insisted upon bringing them before the house on the 17th of April. On that day Sir Francis Burdett and several other friends to Catholic concession declared that the annual discussion of the question was a mere farce, from which the honest advocates of emancipation ought henceforth to withdraw. Mr Brougham indulged in a strain of indig-

George IV. of maintaining a parliamentary appearance of equanimity, or disguising the feelings which it excited. Mr Plunkett insisting upon bringing forward his motion, Sir Francis and many other opposition members rose and left the house. The debate was soon adjourned, and not renewed during the course of the session. In the House of Lords the Duke of Devonshire endeavoured to excite attention to the condition of Ireland, but in vain. In the House of Commons Mr Brougham called for investigation into the gross inequality of the Irish law wherever Catholic and Protestant were opposed, and to the yet more oppressive mode of its administration; but the house refused to entertain the question. Mr Hume exposed the more prominent defects of the church establishment, but could scarcely obtain a hearing from an audience unwilling to be convinced. Ireland perceived that reason was no match for injustice armed with power; and a conviction began to prevail that the use of other means had become necessary. In the course of a few years, this sentiment animating an immense organized body, impelled by the unwearied activity of an agitator of high talents, wrung from a reluctant government the boon which had so long been humbly prayed for, but in vain.

The affairs of the colonies and other dependencies excited this year more than the usual share of attention. An act was passed, establishing courts, and making other regulations for the administration of justice in New South Wales and Van Diemen's Land. A bill for remedying abuses in the administration of justice in Newfoundland was announced by ministers as in preparation. A strenuous effort was made on the part of the East India merchants to obtain an equalization of the duties imposed on the sugars imported from Hindustan, and those which were the growth of the West Indian colonies; but it was defeated by the exertions of the planters. But the measure most important, both in regard to the test it afforded of the progress of liberal opinions, to the consequences it has already produced, and the still greater results it must ultimately lead to, was the ministerial circular of the 24th of May, relating to the treatment of slaves in the British colonies. This document followed up the resolutions adopted by the House of Commons on the 15th of the same month at Mr Canning's suggestion. The resolutions declared the anxiety of the house that immediate measures should the slave's character as might render safe his ultimate admission to participation in the civil rights and privileges of other classes of his majesty's subjects. The circular the case of females, and forbade the carrying of whips on nation in the sugar colonies was violent and unanimous, again with applause. Jamaica spoke of asserting its independence. In Barbadoes, the chapel of a missionary suspected of having transmitted unfavourable accounts of the treatment which the slaves experienced at the hands of the planters was demolished, and the clergyman himself obliged to abscond. In Demerara the promulgation of the order in council was deferred, and all knowledge of it attempted to be withspread among them, the mysterious silence of their mas-

Reign of nant invective that stung Mr Canning beyond the power clearest exculpatory evidence. They did not dare to in- Reign of flict their unjust sentence, but the unhappy martyr died George IV. in prison before the news arrived that the king had rescind-1824. ed his condemnation.

The policy of government, liberal in the highest degree when compared with what the nation had been accustomed to, blinded men to its defects. The brilliant and somewhat gaudy eloquence of Canning strengthened the charm. His speech delivered at Plymouth in October completed his achievement. The splendid diction and imagery with which he adorned his development of the system adopted by himself and his colleagues carried away all who heard and all who read that magnificent oration. A palpable object to be attained, one of the most winning appearance, seemed to be placed within their view, nay within their reach. They soothed themselves with the idea that the honour to be gained would be shared by themselves. They forgot that nothing beyond fair words had been afforded to the falling constitutional governments of the Continent; that the reduction of national burdens so ostentatiously paraded had left them much as they were; that the sister island remained convulsed by faction, and robbed of her rights. All these they forgot and forgave for the sake of a few fair promises. Castlereagh had endeavoured for years to tame the spirit of the country by whips and dungeons, but in vain. Canning sung its stern resolves to peace in the course of twelve months. At the expense of some slight concessions to popular opinion, the governing party had renewed its lease of power for an indefinite term.

During the year 1824 ministers continued, by perseverance in their new sprung liberality, to grow in the good graces of the nation. The opposition found it extremely difficult to muster a respectable minority. Attempts to attach to government the stigma of having played a double game with the Spanish constitutionalists, and given underhand encouragement to the French, were successfully repelled. Calls for an acknowledgment of the independence of the South American states were answered by the declarations of Lord Liverpool and Mr Canning, that to all useful intents they had been declared independent. They were allowed the privileges of free states under the new navigation act, and consuls had been appointed at their most important maritime towns. A formal acknowledgment of independence could be made only by the power which claimed dominion over another. Ministers therebe adopted for securing such a gradual improvement of fore contended that one thing only remained to be done, namely, the opening a diplomatic intercourse with these countries; but the power of deciding at what period this step ought to be taken, they maintained, was unquestioncommanded the abolition of the punishment of flogging in ably the prerogative of the crown. Parliament declared itself satisfied with these reasons; and a further declarathe field in the crown colonies. Enactments to the same tion by Mr Canning, that government had refused a seeffect were recommended for the adoption of the legisla- cond and urgent application to become a party to a new tive bodies of the chartered colonies. The burst of indig- congress, made the walls of the House of Commons ring

Notwithstanding the caution with which ministers avoided any express pledge to recognise the independence of the rising states in the new world, active preparations were making for paving the way to such a step. So early as the end of August 1823 the diplomatic agent of the United States in England had been sounded as to whether " the moment had not arrived when the governheld from the negroes. Some vague surmises having ments of Great Britain and the United States might come to some understanding with each other on the subject of ters excited the most unreasonable expectations, and hope the Spanish American colonies; and whether, if they could deferred precipitated them into insurrection. The planters arrive at such understanding, it would not be expedient in their blind fury accused the missionaries of exciting a for themselves, and beneficial for the world, that the prinrevolt which had been caused solely by their own illegal ciples of it should be clearly settled and plainly avowand unwise proceedings. A court-martial convicted Mr ed." The American envoy did not feel himself autho-Smith, one of the Independent clergymen, ip the face of the rized to enter, on the part of his government, into any ex-

Reign of press understanding on the subject. Mr Canning next George IV. turned to the French ambassador, with whom he opened a conference in October of the same year. The reply of this diplomatist was evasive and unsatisfactory, and seems to have fixed the British ministers in the resolution to wait no longer for the co-operation of any other power. In fulfilment of the promise made to the South American traders, consuls were dispatched to all the principal seaports within the Spanish provinces on that continent and Mexico. Commissioners were at the same time dispatched to Colombia and Mexico, with directions to report on the political state of these countries. The measures of the British government were precipitated by the urgency of opposition, by the reluctance manifested on the part of France to withdraw her troops from Spain, and by the intelligence which arrived early in 1824 of the preparatory steps taken by the president and congress of the United States towards recognising the independence of South America. Towards the end of July Mr Parish was dispatched to Buenos Ayres, intrusted with powers to negociate a commercial treaty with that state, in the contingency of the government continuing to afford a reasonable prospect of being able to maintain its authority. On the 14th of December it was determined to recognise forthwith the independence of Colombia and Mexico; and by the first day of the year 1825 instructions and full powers had left the coasts of England, and the ambassadors of the allied courts received intimation that measures for recognising the independence of the three most powerful of the new states of Spanish America had been taken, past recall, by the British government.

Great Britain might in the year 1824 be regarded as emancipated from the false position in which, as a free and commercial nation, she had long found herself entangled. The good work was carried on by the adoption of several important measures both in and out of parliament. The first was the removal of certain stoppages and impediments to a free internal circulation. An act passed in the former session for repealing some, and providing for the progressive discontinuance of other duties to which the manufacturers of Great Britain and Ireland respectively were subject, on their importation from either country into the other, had been found so beneficial, that all the duties left in existence were repealed. Next in importance was the measure introduced by Mr Huskisson for placing the home silk manufacture on a more natural basis, by lowering the duty on raw silk, repealing the bounty on the exportation of silk goods, and substituting a duty of thirty per cent. on the importation of foreign silk manufactures. The interests of the operatives received also a share of legislative attention. The old laws against combinations of workmen for the purpose of regulating the price of labour and the hours and manner of working, were abolished by an act which denounced severe punishments against those who should attempt to influence or overawe by violence or intimidation. The laws against the emigration of artizans were likewise repealed. An act was passed of the greatest consequence to commercial dealings, establishing a uniformity of weights and measures, to commence from the 1st of May 1825. A bill for the repeal of the usury laws, a measure even more vitally important than any we have now enumerated, was thrown out by a manœuvre; its opponents having moved that it be read that day six months, at a late hour, when many of the supporters, expecting no further division, had left the house. While the legislature was thus employed, the executive was busy giving a wider extension to the system of reciprocity in commerce. Commercial treaties with Portugal and the United States of America, including this reciprocity arrange-

ed since 1810 in the case of the former nation, and 1815 Reign of in that of the latter. A similar convention was concluded George IV. with Prussia in the April of the year the occurrences of which we are now narrating. The next arrangement was with Sweden. It was at first effected without treaty, and matters remained in this unauthenticated condition till 1826. A convention for reciprocal equality, to endure for ten years, was concluded with Denmark in June. In May the kingdom of Hanover, and in October the duchy of Oldenburg, were admitted to the footing of reciprocity by an order in council. France and the Netherlands adhering to their impositions upon British vessels, were subjected to retaliation.

1824

Government continued to advance with a hesitating and timorous step along the path of legal reform, into which it had reluctantly been forced. The reversal of attainders of several noble Scottish families may be viewed as falling under this head, but was a measure of little general importance. The different bankrupt laws were consolidated into one act, which, however, never received effect, a new enactment having been found necessary before the time arrived at which it was to have come in force. An attempt to procure for persons accused of felony the benefit of counsel was again defeated by the address of the lawyers and the prejudices of the country gentlemen. The utmost attempts of the friends of law reform could this year procure nothing more than the appointment of commissioners to inquire into the proceedings of the court of chancery. The commission consisted of the chancellor, master of the rolls, and vice-chancellor, together with some masters in chancery, barristers, and members of parliament. This, however, was at least something gained.

The financial arrangements of ministers encountered little opposition. The revenue of the preceding year had exceeded the expenditure by L.6,718,985. From this it was necessary to deduct L.5,000,000, the sum set aside for the gradual diminution of the national debt. The surplus immediately available was L.1,718,985. Ministers anticipated an additional surplus of L.1,052,076 during the current year. This excess of income over expenditure was accounted for partly by retrenchment and partly by savings in management. Various items of charge which intercepted a part of the revenue in its progress to the exchequer were reduced. A saving of one half per cent. on the interest of the debt was effected. The bounties on the whale and other fisheries were allowed to expire. Under these favourable circumstances, and with a prospect of their continuance, ministers felt themselves authorized to commence a system of alterations in the commercial and fiscal regulations of the country. They proposed to begin by putting rum, in regard to the duty with which it was chargeable, on a level with spirits produced by British distillation. The duty on coals and wool was diminished. The alteration on the laws regulating the silk trade, which has already been adverted to, was the last measure proposed for immediate adoption. The total reduction thus effected upon the national burdens was:-

Rum.....L.150,000 Coals...... 100,000 Wool...... 350,000 

L.1,062,000

The relief was kept within the limits of the fund which afforded the means of granting it.

Ireland continued to experience but a small share of this conciliatory policy. Although disturbances had in a great measure ceased, the insurrection act was again renewed. The claims of the Catholics continued to be urged ment (not however extending to the colonies), had exist- with increasing feebleness, and operated with additional

Reign of inveteracy. Committees were demanded both in the inquire into the loss occasioned by the late revolt, and to Reign of George IV. Lords and Commons for investigating into the state of report on the best mode of obtaining compensation from George IV Ireland. Ministers, however, evaded the inquiry by li- England. An attempt was likewise made to repeal the

miting it to the nature and extent of the disturbances that had prevailed in the districts of Ireland subject to the operation of the insurrection act. At a subsequent period of the session, Mr Hume moved "that it is expedient to inquire whether the present church establishment of Ireland be not more than commensurate to the services to be performed, both as regards the number of persons employed, and the incomes they receive." In a house of two hundred and thinks they receive. dred and thirty-two, only seventy-nine members supported the motion. This repulse, however, operated as an incentive rather than as a discouragement. The Catholic Association now began to assume a bolder tone, to extend its local connections, and to adopt the most decided measures. Its members held regular sessions in Dublin, constituted themselves the medium of communication between Ireland and parliament, ordered a census of the population to be taken, and appointed collectors in every district for the receipt of the "Catholic Rent." Mr O'Connell may be regarded as the effective founder and organizer of this body. The violent and theatrical character of many of its proceedings cannot be denied; but it had the effect of giving concentration, and a rational aim, to the angry efforts of the oppressed Irish. It at once added a fresh energy to their demands for redress of grievances, and withdrew from them the temptation to illegal and atrocious acts of vengeance. Beneath its influence, and the restraining force of the new constabulary, outrage subsided to such a degree, that shortly after the close of the session the operation of the insurrection act was suspended in several of the disturbed districts. The clamours of Protestant and Catholic zealots were loud and bitter, but they abstained from personal violence. Increased tranquillity, the loosening of the restrictions upon commercial exertions, and a limited but certain increase of the means of education, shone through the troubles of Ireland like the first dull beams of a tempestuous day-break.

The West India colonies still continued in an unsettled state. A numerous military establishment maintained quiet in Demerara. Such, however, was the malignant spirit of the planters, that a missionary who had been heard to speak favourably of Mr Smith was obliged to quit the colony. In Trinidad the regulations of the order in council were submitted to under protest. In Barbadoes a bill for admitting the evidence of slaves in certain cases miscarried, and Mr Canning's plans were contemptuously neglected. In Dominica the governor recommended to the legislature the incorporation of the whole of the slave-laws into one act, comprising the substance of the order in council, and repealing such statutes as were at variance with its spirit. The House of Assembly refused, and expressly declined, to contribute any pecuniary aid towards the instruction of the slaves. In Jamaica the temper of the planters had been ruffled by a partial insurrection of the slaves; which, however, had been suppressed without loss either of lives or property. A fresh alarm was given during the month of June. On both occasions a number of negroes were executed. The revolt was supposed to have originated in some vague expectations on the part of the slaves of aid from England. The House of Assembly, which met in November, was informed that the general government had appointed a bishop for the island, and appropriated a fund for the support of the Episcopal clergy. One important office confided to the bishop was the superintendence of the religious instruction of the slaves; and the return required for this benefit was the adoption of the order in council. The angry planters, instead of complying, appointed a committee to

registry act, and much violent and foolish language was uttered. All the other colonies were tranquil, except Lower Canada and the Cape of Good Hope. In the former province, constitutional questions of an essential and grave nature were urged. The House of Assembly on the one hand, and the governor, supported by the legislative council, on the other, were at issue respecting the claim of the former to the right of disposing of the whole revenue. The governor and council would not admit the claim to its full extent; the Assembly refused the supplies; a dissolution ensued, and the different branches of the legislative body parted in very bad humour with each other. The disquiets of the Cape were caused by the petty tyranny of the governor Lord Charles Somerset. Sixty of the most respectable individuals of Cape Town were desirous of establishing a literary society, a museum, and a library. A fundamental article of the constitution of this body, was the exclusion from their discussions of controversial theology, the question of slavery, and all purely professional subjects; but the governor condemned the scheme as illegal, and induced the chief justice and some other members to withdraw their names. The reasons which he assigned for calling the society illegal were, first, because they had presumed to form themselves into a society " without

any previous reference to his excellency," which he de-

signated as a complete disregard of the existing authorities at the Cape; secondly, because it was improper to permit the establishment of an association which might

have a tendency to produce "political discussion." Ano-

ther instance of the governor's proceedings was his conduct

towards Mr Greig, the editor of a newspaper, who had pub-

lished an article which Lord Charles conceived to be disrespectful to his administration. The offender was order-

ed to quit the colony within a month. He abandoned his

employment, and advertised his effects for sale; but by

this time the governor had changed his mind, and Mr Greig received intimation that he was at liberty to remain

in the colony.

England was this year involved in two wars by her foreign possessions. The Burmese war will fall to be noticed when we come to narrate the events of 1826, when it was terminated. The petty skirmishes with the barbarians of Ashantee were the cause of much private grief, and materially enhanced the expenses attendant upon the maintenance of an unhealthy and useless establishment; but were too trifling to affect the majestic interests of Britain. The shock which had been communicated both to the agricultural and manufacturing interests, by the transition from a state of commerce in which, although exposed to hostile depredation, they were encountered by no competition, to the rivalry of every nation, and increased in vehemence by the measures taken to restore the currency to a sound state, had begun to pass away. The prospect of a government acting upon a rational system cheered men's spirits; and under such auspices national industry, although still trammelled and burdened by an unnecessarily complicated, wasteful, and extravagant executive system, was beginning to regain a healthy tone. There was a regular demand for labour, and wages were rising. Manufactures of every kind were prospering. The abundance of capital led to many new devices for its employment. The lately opened trade to South America was prosecuted, with all the sanguine hope of ignorance, to an absurd extent. Joint-stock companies were formed for working the mines and conducting its pearl fisheries. The rage for such associations spread through every department of domestic industry. The wildest anticipations

VOL. V.

Reign of of profit were indulged. The nation, drunken with the ciously to his line of argument. Mr Canning alone at- Reign of George IV sudden increase of its mercantile transactions, was preparing for itself a sudden and tremendous reflux of its spring-tide of prosperity.

Parliament met in 1825 on the 3d of February. The question most urgently pressed upon its consideration was the necessity of suppressing the Catholic Association. The coldness of lukewarm friends, and the open enmity of avowed enemies, had rallied the whole of the Catholics and a great number of the Protestants of Ireland around this body. A contempt for the rights of citizens had called it into existence and invested it with power; and now the oppressors were the first to discover the might with which they had invested it, but without feeling inclined to betake themselves to the only effectual method of destroying it, namely, removing the grievances which gave it birth.

The expressions in the king's speech applicable to the Catholic Association were these:—"It is to be regretted that associations should exist in Ireland, which have adopted proceedings irreconcilable with the spirit of the constitution, and calculated, by exciting alarm, and by exasperating animosities, to endanger the peace of society, and retard the course of national improvement. His majesty relies upon your wisdom to consider without delay the means of applying a remedy to this evil." dress in answer to the speech from the throne was agreed to without a division. Several of the opposition members, however, protested against the line of policy indicated in the passage which we have quoted. In the Lords, the Marquis of Lansdown cautioned ministers not to be hasty in repressing open complaint, and not to beguile themselves with the idea of curing a malady merely by removing a few of the outward symptoms. Mr Brougham, in the Commons, maintained that the delay of redress had driven the Irish to seek it at their own hands. He exposed the insincerity that lurked under the plural "associations." It was a juggling attempt to assume the appearance of dealing equal justice to the Orangemen and

the members of the Association.

Ministers were not slack in following up their denunciation. On the second day of the session Mr Goulburn gave notice that he would, on the 10th of February, move for leave to bring in a bill to amend certain acts relating to unlawful societies in Ireland. The acts referred to were two in number. The oldest, enacted by the Irish parliament in 1793, prohibited all assemblies for the appointment of deputies, or which assumed in any manner the right of representing the people of that country. The other, passed in 1823, with the view of conciliating party feuds, was directed against Orange societies and Orange processions. Neither touched the Catholic Association. Mr Goulburn, when propounding his measure, dwelt at great length on the members of the Association. According to him, it was composed mainly of priests, men of disappointed ambition, and the familiar friends of Tone and Emmett. The Roman Catholic gentry who belonged to it were acting, he averred, under intimidation. The objects of the institution he described as being the levying of an unauthorized tax by the agency of the priests; instituting prosecutions against individuals accused of perpetrating outrages, or acting as incendiaries; and assuming the right to call upon the illegal societies to disband. With regard to the last charge, Mr Goulburn expatiated at considerable length on one part in the Association's "Address to the People of Ireland," in which they adjured them to refrain from secret and illegal societies, "by the hate you bear the Orangemen, who are your natural enemies." The members who, in the course of the debate, supported Mr Goulburn's motion, adhered most pertina-

tempted to awe the house by insinuating that its vote George IV against the motion would be tantamount to a declaration that it had satisfied itself "that his majesty had been deceived by false information; and that the description applied in his majesty's speech to the associations in Ireland was altogether incorrect." On the part of the opposition, Sir Henry Parnell showed that Mr Goulburn had misrepresented the mode of collecting the Catholic rent, and the share taken by the priests in the operation; and Mr Tierney affirmed that he had exaggerated its amount. Mr Denman contended that the analogy which had been attempted to be established between the case of the constitutional association and that before the house, did not hold. The former sullied the fountain of justice, because men who accused a man because he entertained certain opinions, might sit upon his trial as jurors. The latter was at the most but on a footing with associations for the prosecution of thieves and swindlers. The members only bound themselves to contribute to the prosecution of men guilty of offences which were allowed by the whole world to be such. Each might bring to the consideration of the individual case a mind free from prejudice. Mr Plunkett, although in favour of the motion, admitted that it was quite legal to associate for the purposes professed by the Association. Mr Goulburn's motion was, however, agreed to, after a debate which lasted four nights. The Catholic Association made application to be heard at the bar of the Commons; and being denied that privilege, they repeated the request to the Lords with the same want of success. The bill passed both houses, and received the royal assent on the 9th of March. But the Association, strong in the national affection, was not so easily discomfited. It submitted without a struggle; but no sooner was the session closed than an aggregate meeting of the Catholics re-established it with a constitution which did not come under the law. Like Milton's spirits, it re-united, seemingly incapable of " mortal wound" in its " liquid texture.

1825.

The friends of the Catholics laid hold of the occasion, when the pretended advocates of emancipation were protesting the more violently their continued attachment to the cause that they were busy binding those who petitioned for it, and when some of its opponents were shaken in their firmness by the determination of the people, to renew the question. Sir Francis Burdett, after some preliminary discussion in committee, introduced a bill for the relief of the Catholics on the 23d of March. Two subordinate bills were introduced at the same time for the purpose of conciliating the most determined enemies of concession. By the one the qualification of a voter was raised to a freehold of L.10 per annum, while the object of the other was to make a provision for the Catholic clergy. The friends of the principal measure were by no means agreed as to the auxiliaries; but their variance was rendered of less consequence by the fate of the bill. While it was yet before the committee of the House of Commons, the Duke of York rose in his place in the Upper House, and in a long and confused speech declared his resolution to oppose every concession "up to the latest moment of his existence, whatever might be his situation in life, so help him God." This uncalled for and illiberal declaration of the heir-apparent exasperated the Catholics and grieved their friends. The bill passed the Commons notwithstanding; but was, as every one anticipated, thrown out in the Lords.

While parliament was thus refusing their just rights to the Catholics in one breath, and in the next forbidding, under heavy penalties, every attempt to vindicate them, the committee appointed by the Lords during the previous session to collect information respecting the state Reign of of Ireland, were proceeding with the investigation. The George IV evidence led established the existence of the most extensive and pervading misery. The peasantry were described as in the colonial ports were abolished. Two further alterations in the colonial ports were abolished.

being constantly on the verge of starvation, the victims of disease produced by the state of their squalid habitations. They were servilely dependent on their landlords, the tithe-agents. The law which was devised to protect them had been perverted into an engine of oppression. The report of the committee was presented at too late a period of the session to admit of its being made the basis of any enactment. Various attempts were, however, made in the House of Commons to procure redress of specific grievances. Sir John Newport, founding upon the report of the commissioners on education, moved an address to the king, praying his majesty to give orders for instituting prosecutions against different individuals connected with the charter-schools of Ireland, who had been accused of gross acts of cruelty; which was agreed to unanimously. Mr Hume renewed his attack upon the established church in Ireland, but with a diminished number of supporters. And after wasting the best part of five months in vehement declamation, and passing a number of unimportant laws, parliament abandoned Ireland to the rage of party spirit, with scarcely any thing to preserve that country from anarchy but the vigilance and influence of the Catholic Association.

Meanwhile discussions leading to a more satisfactory result had been agitated in parliament. On the 29th of March Mr Huskisson called the attention of the House of Commons to the effects of Mr Hume's bill of the previous session, repealing both the common and statute law against combinations among workmen. It was to be expected that men new to liberty should in some measure abuse it. Every unaccustomed pleasure is apt to be indulged in to excess. Accordingly it was found, that in west of Scotland and the sea-ports, the operatives had immediately availed themselves of the privilege of com-bination to an extent that endangered the just rights of

17 " 1 ......

tions of a local nature were contemplated. The sugar of the Mauritius was admitted at the same rate as that of the West Indies; and the corn of Canada was admitted and harassed incessantly by the unprincipled extortions of into Great Britain on payment of a moderate duty. This last provision, however, was limited in its operation to the space of two years. This measure was accompanied by a second, which had for its object the promotion of commerce by the diminution of duties imposed for protection, and not for revenue. A third was added, tending to relieve the navigation of the country. Quarantine duties were abolished. All fees on commerce with the colonies were done away. The duty imposed upon the transfer of ships was removed. And, lastly, the system of consular establishments was reformed by the substitution of fixed salaries, payable out of the public purse, for the burdensome and unequal fees which had previously been levied. These measures, although viewed with apprehension by some members of the legislature, were approved of without a dissenting voice. The surrender of its charter by the Levant Company at the same time conferred an additional benefit on the mercantile interest. The repeal of the usury laws was again attempted, but without success. A further reduction of taxation was effected by the chancellor of the exchequer, but not to any great

The excessive speculation occasioned by the increasing commercial prosperity of the country led, in the autumn of 1825, to such a reverse as might have been anticipated. Lord Liverpool and Mr Huskisson had raised their warning voices against the excess of speculation. Mr Tooke and Mr McCulloch distinctly foretold the convulsion which was about to happen. The process of the change was this:—" The depressed state of trade in 1821 and 1822 several parts of the country, and more particularly in the had led to a diminished production and importation of goods, and to an advance of prices in 1823; and the very high prices of 1824 and 1825 were the result, first, of this diminished production and importation; secondly, of an their employers, and threatened to place themselves at the improvement in the state of agricultural produce; thirdly, mercy of the more artful and unprincipled of their own of the acknowledgment of the independence of the South The treasurer of the navy concluded his exposi- American republics, which opened new markets to Brition of the state of combinations by moving for a commit-tee to report their opinion how far it might be necessary for these republics, and transmitted in manufactured to repeal or amend the act 5th George IV. cap. 95. The other measures introduced by Mr Huskisson were less exceptionable. The first was an importnot be quickly realized. Several important commercial ant modification of the colonial system. The commerce failures took place, and the country became alarmed. A of the colonies was thrown open to a certain extent to all run upon the banks ensued, and several of them gave way. friendly powers. They were entitled to trade thither On the 12th of December it was announced that a London with goods of their own produce in their own ships. The house, upon which no less than forty-seven country banks bonding system was likewise introduced into the colodies, and five warehousing ports appointed; Kingstown another equally important house was announced. Mr

Reign of Baring thus described the scene which ensued:- "A pa-George IV. nic seized the public. Men would not part with their money on any terms, nor for any security, and the consequence was general distress. Persons of undoubted wealth and real capital were seen walking about the streets of London, not knowing whether they should be able to meet their engagements for next day." On the Wednesday the bank began to increase its discounts; it purchased exchequer bills, and discounted on stock. Before the end of the week it had issued in gold and notes not less than eight millions. In the mean time meetings were held in London, and in most of the trading towns, in which resolutions were adopted for the support of commercial credit. The public mind gradually became re-assured, but in the interval banks had broken down in every district of England. Between October 1825 and February 1826 fifty-nine commissions of bankruptcy were issued against English country banks; and at such a time the number of private compositions are estimated to be to the number of commissions in the proportion of four to one. In a mercantile nation such a suspension of the circulation paralyses every effort. The ship-owners suffered from their inability to procure freights; while the artizans were thrown out of employment, and exposed to famine. Scotland the momentary distress was equally great, but the more solid system of banking materially alleviated the after-pressure. Mistrust and apprehension darkened the close of 1825, and threw their shade over the prospects of the opening year.

Parliament was opened on the 2d of February 1826 by commission. Almost the only topic touched upon in the speech was the distress which pervaded the nation. "The embarrassment," it said, "did not arise from any political events either at home or abroad. It was not produced by any unexpected demand upon the public resources, nor by the apprehension of any interruption to the general tranquillity. Some of the causes to which this evil must be attributed lie without the direct reach of parliamentary interposition, nor can security against the recurrence of them be found, unless in the experience of the sufferings which they have occasioned. But to a certain portion of this evil, correctives, at least, if not effectual remedies, may be applied, and his majesty relies upon your wisdom to devise such measures as may tend to protect both private and public interests against the like sudden and violent fluctuations, by placing on a more firm foundation the currency and circulating credit of the country.'

The answer proposed by the ministerial party to be returned to this recommendation was agreed to in both houses without opposition; but many members embraced the opportunity of stating their opinions of the state of the country, and the measures that ought to be adopted. Lord King attacked the corn laws, and proposed that the Lords should pledge themselves to their revisal during the session. Mr Brougham thought the causes of the distress more complicated than those adverted to in the speech, and dwelt upon its universality as a sufficient proof that its origin was not to be sought in the adoption of more liberal commercial principles. Mr Hume maintained that the true cause of the distress was the heavy pressure of taxation, and the wasteful expenditure of government. The members connected with the country bankers defended the characters of these gentlemen; and Mr Baring and others eulogised the conduct of the Bank of England. Ministers announced that the palliatives they meant to apply were, first, to prohibit the circulation, after a certain period, of notes under two pounds, whether issued by the Bank of England or any private banker; secondly, to increase the stability of private banks, by enabling them to augment their capital, and with that view to repeal

the clause in the charter of the Bank of England which Reign of made it unlawful for any private banking establishment to George IV. consist of more than six partners. 1826.

The first of these projects carried into execution was that which contemplated the destruction of the small notes. Government entertained apprehensions that during the interval which must necessarily elapse between the announcement of their plan and its receiving the sanction of law, an infinite number of small notes might be stamped, and immediately gave orders to put an end to the stamping of such notes. The step was animadverted on in both houses as a most dangerous assumption of power, but defended as necessary to insure the success of the measures in contemplation. On the 10th of February the chancellor of the exchequer, in a committee of the whole house, fully developed that part of the plan which related to the small-note circulation. He proposed that no new notes under the value of five pounds should be stamped; and that all promissory notes payable to the bearer on demand, issued by license, and under the value of five pounds, and stamped previous to the 5th of February 1826, should be allowed to circulate until the 5th of February 1829, and no longer. Ministers at a later period consented to allow the Bank of England the power to issue one and two pound notes, stamped at any time prior to the 10th of October, but not to continue them in circulation after the lapse of three years, the limited date of the existence of such a circulation. This measure met with vehement opposition in the Commons, but from a very small minority. In the Lords it was less pertinaciously opposed. Ministers had from the beginning limited the immediate operation of their bill to England, but declared that they could not see on what principle different systems of currency should prevail on the opposite sides of the Tweed. Scotland took the alarm; a smallnote currency was there identified with every step in the march of national improvement. The tables of both houses of parliament were instantly loaded with petitions from that country against any restrictions on its paper currency. It was necessary to pay attention to representations in which men of all political parties and every rank in life concurred. Select committees were appointed to investigate the matter; and the result of their inquiries was, that the small-note currency of Scotland remained untouched. Ireland was also left in possession of her small notes.

In order to give effect to the other measure contemplated by ministers, it was necessary to interfere to a certain extent with the chartered privileges of the Bank of England, and the consent of that body was therefore requisite even to its introduction. A communication was accordingly made by the first lord of the treasury and the chancellor of the exchequer, to the governor of the bank, on the 13th of January, containing a detailed and luminous exposition of the views of ministry, and expressing their hopes "that the bank will make no difficulty in giving up their exclusive privileges, in respect to the number of partners engaged in banking, as to any district fifty miles from the metropolis." The directors, in their answer of the 20th, declined the task of recommending to the proprietors the abandonment of their exclusive privileges. Several papers were interchanged, and finally, a general court, held on the 3d of February, consented to waive their privilege, except within a district of fifty miles round the city of London. In the course of this correspondence the propriety of the bank establishing branches was suggested by government. The measure founded upon this arrangement was first introduced into the House of Lords; but no discussion took place upon it, until on the 17th of March Lord Liverpool moved the second reading. The debate even then wanGeorge IV 1826.

The adoption of the notes issued by the branch banks payable at the place where they were issued. The bill experienced a warmer opposition in the House of Commons, but was ultimately, with some slight alterations, agreed to.

Public confidence was not however yet quite restored, and ministers were pressed to take some step for the alleviation of the immediate pressure. After some hesitation, an arrangement was made with the bank, in virtue of which it agreed to make advances to private individuals upon the deposit of goods, merchandise, and other securities. The whole sum advanced was not to exceed three millions. The adoption of this measure rendered it necessary, for the security of the bank, to introduce a new bill regarding the law of principal and agent. This act enabled all persons in the possession of goods, possessed likewise of documents conferring the property of them, although such persons should be merely factors or agents, to pledge with the bank as effectually as if they had been the actual owners. Its operation was confined to deposits made with the bank. Commissioners were immediately appointed by the bank in the principal provincial towns. They were almost uniformly merchants resident in the district. The applications for advances were much fewer than had been anticipated: either men were unwilling to disclose their necessities to local competitors, or the knowledge that a fund was provided restored confidence.

During these transactions the cause of the late panic continued to be keenly canvassed both in parliament and beyond its walls. Emigration was suggested as a source of relief for the labouring classes, and a committee appointed to collect information on the subject. The corn laws were most vehemently exclaimed against, and even forced upon the notice of parliament. Ministers acknowledged the necessity that existed for thoroughly revising them, but deprecated the introduction of so extensive a topic during a session which, as the last of that parliament, must necessarily prove a brief one. The general question was evaded; yet before the end of the session, it was found necessary to introduce two bills to modify the strict operation of these laws. The first allowed wheat in bond to come into the market on payment of a duty of ten shillings second gave ministers a discretionary power of admitting foreign grain during the recess to the limited quantity of five hundred thousand quarters. These very slight concesthe land-owners. The silk trade, a branch which had not been long enough exposed to our rigorous climate to be able to bear its severity, was as usual the first to complain. Petitions flowed in upon parliament from every district where this manufacture had struck root. An attempt was made to have them referred to a select committee, as a preliminary step towards checking the advance which had been made by government in liberal commercial policy; but without success. The ship-owners, a body who are sufficiently alive to their own interests, and active in pursuing them, were the next to make their voice heard. Mr Huskisson met their allegations by a prompt appeal to facts, moving for "returns of ships built in the British dominions between 1814 and 1825 both inclusive, distinguishing the number in each year, and the amount of their tonnage."

pation of the country from ill-judged trammels upon its in-George IV In the committee Lord Liverpool moved the addition of dustry were too apparent to allow, in any enlightened mind,

1826.

In the discussions of this session to which we have this clause rendered another proviso necessary, declaring hitherto alluded, the ministers had found themselves uniformly in triumphant majorities, swelled indeed more frequently by their habitual opponents than by some of their avowed supporters. The restriction of the small-note currency was a step of very questionable expediency, but one, however, which admitted of a plausible defence. The curtailment of the bank privileges could only be disapproved of by a member of that powerful incorporation, which had so long controlled at its pleasure all the money transactions and contracts of the kingdom. But the relaxation of the corn laws, and the removal of commercial restrictions, were measures based alike upon justice and expediency, and consequently sanctioned by all the rules of sound policy. Every honest and enlightened man lent a willing support to the projectors of such a system of policy. The state of the finances, however, opposed a serious obstacle to any change of system. Huskisson and Robinson entertained clear business notions, and were willing to adopt a better system. Canning saw that their views were popular, and he coveted the glory of enforcing them. But they and their friends knew perfectly that their places in the cabinet were held by the sufferance of that party which, in virtue of its ascendency in the House of Commons, had the reins of power in their hands. They were kept in office to transact business, whilst the real holders of power reaped the profits. They might make what parade of liberal sentiments they pleased in order to conciliate the nation, as long as they did not trench upon the emoluments of their patrons. The distribution of offices ostensibly provided for discharging the executive functions of the government, was ill assorted and ineffective, but the structure, though in itself frail, was sustained by a power capable of supporting a still weaker fabric.

The chancellor of the exchequer, on opening the budget on the 13th of March, took a large review of the whole financial system of the country from the conclusion of peace. It will be sufficient if we confine ourselves at present to what related more immediately to the period during which he himself had held office. Considerable retrenchment had been effected between 1815 and 1819. During the lastmentioned year an increase of taxation had been made to the amount of three millions. In 1820 there had been no change, and little in 1821. In 1822 Mr Vansittart was reper quarter, and other kinds of grain at inferior rates. The luctantly forced to remit rather more than three millions of taxes. Matters were thus placed upon the same footing as in 1819. Mr Robinson claimed to have remitted during his administration L.8,073,000. The annual charge on sions to sound economical principles were wrung with the whole debt on the 5th of January 1823 he stated utmost difficulty from the landed interest. But, on the at L.29,286,000; and on the 5th of January 1826 at other hand, a portion of the manufacturing and mercantile L.27,946,000; being a reduction of L.1,339,000 in three community showed themselves as unreasonable and selfish as years. But he omitted to remind the house that during each of these three years he had been professedly setting apart an annual sum of five millions as a sinking fund. In his estimate of the amount of the debt he omitted the bargain commenced by Mr Vansittart, and completed by himself, for the payment of military and naval pensions,—an annuity of L.2,800,000, which had forty-one and a half years to run, paid by government to trustees who had undertaken to discharge that burden. Mr Robinson was likewise reminded by Mr Hume that the decrease on taxation was more apparent than real. The taxes in 1818 had produced a sum of L.52,000,000; and in 1825 their amount was L.52,540,000. In 1818 the taxes were payable in paper not convertible into gold, on an average of three years, at a lower rate than L.5 per ounce. In 1825 they were payable in gold, or in paper money convertible into gold.

Reign of at the rate of seventy-seven shillings and tenpence half-George IV penny per ounce. In reality there had been an increase of taxation instead of a reduction. The chancellor of the exchequer evaded Mr Hume's statements and arguments, under the pretext that they were too complicated to be discussed at once. There was nothing in the argument he advanced, that the amount of revenue being derived chiefly from the excise and customs, indicated increased consumption. If the officials of government were adequately remunerated in the depreciated currency, they were extravagantly paid after its value had been raised. Undue burdens were imposed upon the country; but these were never adverted to. The majorities were the only answer relied upon by ministers; and they were applied with great success to meet motions for reduction of the naval, military, and diplomatic expenditure.

The discussions which arose during this session on the state of Ireland were as vain and fruitless as might be expected from a legislature indifferent to or ignorant of the

merits of either question.

In the speech by which the session was prorogued, allusion was made to the termination of hostilities with the Burmese empire. The origin, progress, and termination of this war were briefly these :- For many years the Burmese officers had been in the practice of committing acts of encroachment and aggression on the East India Company's territories. Towards the close of the year 1823 they had crossed the frontiers, and entrenched themselves within the limits belonging to the British. During January and February 1824 they were driven from several of their stockades; but on the 21st of February they succeeded in repulsing a British force, which inspired them with fresh audacity. The governor-general, by the advice of his council, issued a declaration of war on the 5th of March. A considerable naval and military armament, drawn partly from Madras and partly from Calcutta, was assembled at Port Cornwallis in the beginning of May, under the command of Sir Archibald Campbell and Commodore Grant. It attacked Rangoon, the principal sea-port of Ava, on the 10th of May, and took it after a feeble resistance, without the loss of a single man, capturing on the occasion a considerable quantity of artillery and ammunition. A detachment sent against the island of Cheduba, on the Arracan coast, and another against Negrais Isle, at the mouth of the Nerbudda, were equally successful. On the 10th of June General Campbell moved upon the enemy's camp at Kemmendine, which he attacked in concert with the flotilla. The position was evacuated by the Burmese troops, after sustaining a cannonade of a few hours. The British maintained their advantage in several engagements, and the enemy withdrew to a greater distance; but the inundations, and the necessity of collecting a large supply of provisions, induced General Campbell to continue his head-quarters at Rangoon up to the end of the year. Expeditions were, however, detached against the most important maritime stations; and by the end of October the whole of the Burmese coast from Rangoon to the eastward was subjected to the British arms. On the 1st of December Maha Bundoolah, who had been lately appointed to the command of the Burmese army, appeared in front of General Campbell's position with from fifty to sixty thousand men. He was allowed to extend his line round the British flanks, and to the rear, and even to entrench himself in that position. On the 5th General Campbell attacked and entirely routed his left wing. Bundoolah reinforced his centre and right with the scattered remnant during the night, and presented himself next day in front, having pushed his entrenchments close up to the British lines. General Campbell attacked them at noon, and drove them from all their entrenchments.

Bundoolah having received some reinforcements, took Reign of up a strong position with twenty-five thousand men, George IV "with a judgment," says Sir Archibald Campbell, "which would do credit to the best instructed engineers of the most civilized and warlike nations." On the 15th a body of thirteen hundred of General Campbell's infantry stormed the works, and the enemy fled, leaving their camp standing, with all their baggage and a large proportion of their arms and ammunition. Whilst these operations were carrying on, demonstrations had been made by the Burmese on the Chittagong frontier. Their arms were at first attended by success, and they continued to hover around Ramao till the end of July. Colonel Innes having taken the command of the Sylhet frontier, they gradually fell back; and the end of October saw Cachar completely evacuated, and the enemy in full retreat for Munnipoor. About the middle of February 1825 Sir Archibald Campbell moved from Rangoon upon Prome. The inhabitants of the country through which he passed saw with pleasure the expulsion of the Burmese. Having reached Sorrawah, fifty miles in advance of Rangoon, the commander-in-chief halted in the hope of hearing of the fall of Donabew, which was to be attacked by the column advancing under General Cotton by the Irawuddy. But the attack was foiled. On the 11th of March General Campbell commenced a retrograde movement on Donabew, before which he arrived on the 25th, and established a communication with the water column on the 27th. The batteries were opened on the 1st of April; and Maha Bundoolah having been accidentally killed, the Burmese garrison abandoned the fort. Sir Archibald immediately resumed his march upon Prome, which he entered on the 25th of April without firing a shot. By the 1st of February the Burmese were expelled from Assam. A series of brilliant operations on the 26th, 27th, 28th, and 29th of March gave General Morrison possession of Arracan. In Cachar General Shuldham was advancing upon Munnipoor, which lies two hundred miles north-west of Ammerapoora, the capital of the Burmese empire. The main body of the army was arrested at Prome by the rainy season, and felt somewhat straitened for provisions, the country through which their route lay having been entirely depopulated. The mortality among the troops was also considerable. The Burmese had twenty thousand men at Mecadore, fifty miles from Prome, and the same number at Patana-go. An equally numerous body was interposed between the British force in Arracan and the troops under the com-mander-in-chief. In September negociations for the restoration of peace were set on foot. A cessation of hostilities was agreed to on the 17th, to continue till the 17th of October. Commissioners from the king of Ava met the British general at Neounben-ziek on the 2d of October. They endeavoured to elude his demands for territorial cessions and indemnification; but finding him immovable, requested a prolongation of the armistice, that they might consult their court. It was accordingly extended till the 2d of November. Preparations were in the meanwhile made to prosecute the war with activity in case the armistice did not lead to a definite treaty. On receiving the proposed terms of peace, his majesty of the golden foot burst into a violent passion, and gave orders to renew of-fensive operations. Before the termination of the armistice it was haughtily announced to the British leader-"If you wish for peace you may go away; but if you wish either money or territory, no friendship can exist between us. This is Burman custom." The whole army of Ava, nearly sixty thousand strong, advanced against Prome, occupied by six thousand British and native troops. The left division of fifteen thousand, commanded by Ma-

ha Nemiow, approached close to Prome, keeping the east-

Reign of ern bank of the river. By the end of November the cen- ment. The forty-shilling freeholders, a body of men who Reign of Napadee, on the same side of the river, five miles above Prome. The right, consisting of fifteen thousand men under Sudda Woon, were posted on the opposite side of the river. All these bodies were, according to the military system of the Burmese, strongly entrenched. Sir Archibald Campbell, after expecting an attack for some days in vain, marched on the 1st of December to dislodge the corps of Maha Nemiow; and in this he succeeded after a desperate resistance. The leader fell, and the dispersion of his followers was so complete that they did not even attempt to form a junction with their centre. Sir Archibald, after allowing his troops only two hours repose, returned to Zeouke, having marched twenty-nine miles and fought a battle in the course of a day. Next day the British stormed the heights of Napadee under a heavy cannonade, entirely dispersed the centre, and captured the whole of its artillery, ammunition, and military stores. The position of the right wing was attacked on the 5th; the Burmese were driven from their defences, which were set on fire; and a considerable amount of military stores was captured. The road to the capital was now open, and Sir Archibald, after allowing his men one day's repose, advanced upon it in two columns. The Burmese once more indicated a desire to make peace; but as their shuffling and equivocation rendered it impossible to repose confidence in their professions, the commander-in-chief continued to advance; nor was it till the army had arrived within four days' march of the capital that the king agreed to accept of the terms which were offered to him. He renounced all claims to Assam, Cachar, and Jyntia, and recognised Gumbheer Singh as rajah of Munnipoor. He ceded to the Company the four great divisions of Arracan, and the provinces Yeh, Tavoy, Mergui, and Tenasserim. And to indemnify the British government he agreed to pay the sum of one crore of rupees. Twenty-five lacs of rupees were to be paid before the British retired upon Rangoon; the same sum before they evacuated the king's dominions; and the remaining half by equal annual instalments within two years from the date of the treaty. The handful of troops which had achieved this triumph commenced its return on the 5th of March. The India Company obtained by this conquest the removal of a troublesome neighbour, an increase of territory, and a consequent increased perplexity in its affairs. Britain gained nothing but an augmentation of its military and naval establishments.

Parliament was prorogued on the 31st of May 1826, and dissolved on the 2d of June; and writs were ordered to be issued for a new election, returnable on the 25th of July. The elections afforded a test of the success which had attended the new system of ministers. They showed how far the confidence of the people had been won by the concessions made to the spirit of the age and the popular eloquence of Mr Canning. In Scotland, as was to be expected from its miserable system of mock representation, there was a dull silent adherence to the old routine, from which nothing could be gathered. In Ireland the Catholic Association prosecuted with success its sacred task of forcing from an unwilling government the nation's rights. The bond of union, in defiance of the law, was kept up among its members; "the rent" continued to be levied; and the priests had been won to lend it their confidence. In every district of Ireland the new allies struggled with unwearied assiduity to turn the angry energies of the peasantry into a legal channel, and to teach them to direct their efforts to the attainment of some real good. The elections offered them an opportunity of strengthening the phalanx of their friends in parliament, and of testifying the national senti-

George IV. tre, between twenty-five and thirty thousand strong, un-lage der the Kee Wonghee, showed itself on the heights of to increase and multiply beyond what the land seemed able to support, and more neglected by their suzerains than the beasts of the field, except when the time arrived that they were to be driven to the poll, were converted into an engine to overthrow the power of their creators. The tenantry were besieged by the exhortations of clerical and lay emancipators to remember that they had rights as well as their landlords, and that they owed duties to themselves as well as to others. The great landholders now found the automata upon whom they had hitherto relied asserting wills of their own. The most splendid victory of the Catholics was gained in Waterford, where a member of the Beresford family was compelled to withdraw from the contest. The Catholic Association might point with pride to the change it had worked in the character of the Irish peasant; for, amidst all the heat of contested elections, bloodshed and lawless violence were on the decline, even while the hungry artizans of England were driven by want to violate the law. In England the ministers were almost everywhere triumphant. Mr Brougham experienced a more marked defeat in Westmoreland than on any former occasion. Lord Howick and Mr Beaumont, the Whig candidates for Northumberland, both failed. Mr Huskisson was again returned for Liverpool. The metro-polis alone adhered to its old principles. The usual topics were advanced by the candidates for popular favour. Only one is worthy of being recorded. In proportion as the Catholic cause advanced in Ireland it seemed to grow weaker in England. The same ignorance, prejudice, and sectarian spirit of which the Catholics stood accused was appealed to by their adversaries, and the almost absolute

watchword "no popery" was revived.

The bustle of the elections was succeeded by grave apprehensions of famine. Wheat had proved an average crop through England; but a long drought threatened a dearth in every other sort of grain. Barley was deficient; there was every appearance of a scarcity of pulse; oats, in many districts the most important article of food to the lower classes, and the potato crop, the sole stay of Ireland, threatened to fail altogether. The farmers, too, were suffering; for the violent and continued heats had dried up the richest meadow-land in England, till it became necessary to feed cattle with dry fodder, as if it were the depth of winter. A seasonable change of weather averted a great portion of the impending calamity; but in the month of September prospects were most alarming, and the rise in the price of grain pressed with unwonted severity upon the working classes, who were still suffering from the effects of the late panic. The price of oats in reality exceeded the importation price; but the crafty devices of the landlords' committee respecting the taking of averages precluded the opening of the ports before the 15th of November, although in the interim a famine might have depopulated the country. Ministers generously resolved to risk a violation of the law rather than incur the deeper moral responsibility of allowing the people to perish by famine. On the first of September they issued an order in council, authorizing the immediate importation of oats, oatmeal, &c. upon the persons importing becoming bound to pay a conditional duty. The necessity of obtaining an act of indemnity for this step occasioned the assembling of parliament at an earlier season than usual.

The first session of the eighth parliament of the united kingdom of Great Britain and Ireland commenced on the 14th of November 1826, and terminated on the 2d of July 1827. It adjourned twice; from the 13th of Decem ber to the 8th of February, and from the 12th of April to the 1st of May. It will be necessary, in order to pre-

Reign of serve the current of our narrative free from perplexity, to arrangement which Mr Peel conceived likely to solve all Reign of George IV detail briefly the changes in administration, and the intrigues by which they were effected, before narrating the

legislative proceedings of this session.

Lord Liverpool was struck with apoplexy on the morning of the 17th of February 1827. As it was possible that he might recover sufficiently to resume his share in public business, a feeling of delicacy kept both the king and ministers from taking any immediate steps to re-organize the government. The disunion between the two incompatible parties which composed the cabinet continued to increase after the removal of their connecting link; and a sense of this, aided by the urgency of opposition, forbade longer delay. The first practical discussions respecting a new arrangement took place between the king and Mr Canning, at the royal lodge, on the 28th of March. His majesty's first idea was, to retain the services of Mr Canning and his friends, and to place at the head of administration a peer holding Lord Liverpool's opinions on the Catholic question. Mr Canning explicitly stated, that if those whose sentiments were favourable to the Catholics were to be excluded, solely on account of these sentiments, from the highest offices of state, he could " not consent to be the individual in whose person such a principle should be established." He therefore felt himself bound honestly to state, that "the substantive power of first minister he must have, and, what was more, must be known to have," or he must beg leave to retire from a situation which he could " no longer fill with satisfaction to himself or with benefit to the king's service." Mr Canning felt, in short, that in any administration of which he should form a part, whoever might be the ostensible, he must be the real prime minister, and he was naturally and justly indignant at the demand that he should yield up his laurels to grace the brow of titled imbecility.

With the exception of an interview, during which nothing of moment occurred, Mr Canning had no more communication with the king till the 10th of April, when he received the royal commands to prepare, "with as little delay as possible, a plan for the reconstruction of the administration." There were, however, frequent conferences in the interim between Mr Canning, the Duke of Wellington, and Mr Peel. The last-mentioned gentleman frankly declared that he had made up his mind to resign if an individual favourable to the Catholics were placed at the head of government. The duke urged strongly the necessity of having a prime minister opposed to concession. Mr Peel's professions " of respect and regard" for Mr Canning were unbounded; so much so that Mr Canning expressed himself as feeling "it quite impossible to do sufficient justice to his frankness and straightforwardness, and to feelings for which he owned he had not before given Mr Peel credit." The subsequent conduct of that minister has proved that Mr Canning's first impressions were correct. The haughty character of the Duke of Wellington prevented him from wearing the mask to so much purpose. The language of the Duke of Newcastle, and other adherents of the Duke of Wellington, not disapproved of if not sanctioned by his Grace, had naturally irritated Mr Canning. By the intervention of muduke and Mr Canning, but without producing any effect beyond a re-establishment of the outward show of cordiality, and a conviction in the mind of Mr Canning that the duke coveted the post of prime minister for himself. The justice of this conclusion is established by the eagerness with which that eminent soldier on two subsequent occasions grasped at the office, and by Mr Peel's waiting upon Mr Canning at the king's command, on the 9th of April, to suggest the appointment of the duke as premier, an

George IV. difficulties.

1827.

Mr Canning left the king late in the afternoon of the 10th of April; and as parliament was to adjourn for the Easter recess on the 12th, there was not a moment to be lost. He found Lord Grenville, Mr Huskisson, and Mr Planta at the foreign office. Lord Grenville was requested to bear to his brother-in-law, Lord Harrowby, a verbal announcement of Mr Canning's having been ordered to construct an administration; Mr Huskisson was charged with a similar mission to Lord Melville and Mr Wynn; and Mr Planta to Mr Robinson. The same communication was made by Mr Canning in writing to the Duke of Wellington, Lord Bathurst, Lord Westmoreland, and Lord Bexley. The lord chancellor and Mr Peel were waited upon by Mr Canning in person. The projected cabinet, it was intimated, was to "adhere to the principles on which Lord Liverpool's government had so long acted. Lord Eldon "had long felt anxious to resign; but wished to procrastinate the time, not for his own sake, but on account of the business of his court. In about four months he would wind up its affairs and retire." Finding, however, his colleagues determined to secede from Mr Canning, his lordship at last vacated the woolsack, which he had for so many years occupied. The Duke of Wellington inquired who was the individual intended to be put at the head of the government. To Mr Canning's reply that the king "usually intrusted the formation of an administration to the individual whom it was his majesty's gracious intention to put at the head of it," his Grace rejoined by requesting Mr Canning to desire his majesty "to excuse him from belonging to his councils." Lord Westmoreland hesitated to pledge himself, and ultimately declined office on the ground that "the chief office was in the hands of a person of different principles from Lord Liverpool's." Mr Canning replied to this insinuation; but only received a brief and haughty note, intimating that Lord Westmoreland "declined to enter into a literary conflict upon principles." Lord Bexley first accepted office, and afterwards drew back. Lord Bathurst wished to see Mr Canning, but sent in his demission before an interview took place. The reason afterwards assigned was the resignation of so many of his colleagues. Mr Peel adhered to his first determination. Lastly, Lord Melville made up his mind to resign, because, as he expressed himself in the House of Lords, he doubted the stability" of Mr Canning's administration.

It was impossible for Mr Canning not to see that these answers were the result of combination. The king took the same view of the transaction; and, already moved by the dictatorial tone of the Dukes of Wellington and Newcastle, was roused, by this pertinacious opposition to the minister of his choice, to long unwonted decision. He immediately confirmed Mr Canning's appointment by giving him his hand to kiss. The new premier lost not a moment in gathering the friends who had stood true to him,-Lord Harrowby, Mr Robinson, Mr Wynn, and Mr Huskisson,—and preparing to fill up vacancies. Lord Melville was the last to resign, and his office was the first filled up. Before twenty-four hours had elapsed, his royal hightual friends several interviews took place between the ness the Duke of Clarence, the heir-presumptive to the throne, was placed at the head of the admiralty. Lords Anglesey and Lyndhurst accepted the offices vacated by the Duke of Wellington and Lord Eldon; the Duke of Portland, Lord Dudley, and Mr Sturges Bourne, joined the administration. A negociation was opened with the Whigs through the medium of Lord Lansdowne. Some difficulties occurred to prevent the immediate accession of the party to the number of Mr Canning's avowed supporters. In general, however, they cordially co-operated with him;

Reign of and it was settled, that at the close of the session Lords opposition undermined his strength, and hurried him to a Reign of George IV. Lansdown and Carlisle, and Mr Tierney, should have seats , in the cabinet.

The ministry seemed irresistible. Supported by triumphant majorities in both houses-opposed by the virulent but powerless hatred of a talentless faction of discontented place-hunters—suspected only by Lord Grey in the House of Lords, and Mr Hume and his small band of sturdy reformers in the Commons-it swayed the legislature to its will. The great body of the nation saw, in the junction of the Whigs with Mr Canning's friends, a further guarantee of administrative reform. The question of parliamentary reform had been postponed by universal consent, and the concession of it by the Whigs was less noticed than perhaps it ought to have been. Ireland, relieved from a portion of her fears by the death of the Duke of York, was waiting in breathless expectation of the change which the new arrangements were to work in her favour. The calculations of all were, however, rendered nugatory by the death of Mr Canning on the 8th of August 1827.

George Canning was a great orator, and specious organ of a party, rather than a great statesman. It has been said of him that he had no fixed political principles, no certain rules of public conduct. In his youth he defended despotic opinions, and the policy of restriction; towards the close of his career he patronized popular rights, and advocated a liberal commercial system; and the weapons which he employed, splendid declamation and ready wit, were equally available on either side. It would be in vain to seek in his numerous orations for any clear and distinct delineation of a system, or any accurate definitions of great principles; they are mostly brilliant superstructures, reared upon the ordinary basis of party assumptions. His favourite maxim, "to hold the balance between contending principles," is perhaps the severest censure that could have been pronounced against him; inasmuch as it involves an explicit admission that his system was adapted to the exigencies of his position, without reference to any higher or purer standard. Even his eloquence partook of this incidental and ephemeral character. Some of its finest passages are rather dexterous abstractions and ornate common-places, than those burning expressions of sentiment which strike home conviction, and excite new ideas in the mind. His chief power consisted in an open, generous disposition, which hankered after the love and admiration of all that he came in contact with; in a degree of vehemence, which compensated for his deficiency in reasoning and sentiment; and in a fine feeling of rhetorical beauty, which, from its subdued tone, kept him within the range of the comprehension of those he was addressing. In a popular government Canning would have sunk before men of business talent and ready elocution; in a despotic government his warm temperament would have incapacitated him for competition with cool and calculating courtiers. Even in the House of Commons, his ardent disposition, alike incapable of enduring opposition or of bearing triumph with moderation, if it sometimes enabled him to chastise petulance, occasionally prompted him to indulge in a strain of declamation which in his cooler moments his own generous and candid nature would have led him to condemn. But, on the whole, in a government such as that of England, where a despotic oligarchy sought to amuse the nation with the show of free discussion, he was an invaluable auxiliary in a cause, with which he never could have had any real or cordial sympathy. When it was too late, he awakened to a sense of his true dignity and character. The cold-hearted faction for whom he had exerted his youthful vigour turned the whole energy of their concentrated malice upon him the moment he asserted the natural supremacy of his genius. But although their insolence preyed upon his spirits, and their implacable

premature grave, a halo of glory brightened round the close George 1V. of his career, and he died an object of admiration to many, and of wonder to all.

The cabinet he had collected did not long survive him. His personality was the only cement that kept it together. Had he survived, time might have given it consistency; but both he and his immediate friends must have purchased it at the price of large concession to popular demands. He had thrown himself into the arms of the Whigs, and both parties must have thrown themselves, as the latter have since done, into the arms of the people, to enable them to make a stand against the aristocracy. His cabinet at the moment of his death consisted of three incompatible parties; -some adherents of the old far niente system; Mr Huskisson and others, who wished to govern in accordance with popular principles, but without conceding any direct influence to the people; and the Whigs, whose professions had ever been a desire to afford the people a more direct voice in public councils. At the head of this discordant mass was placed Lord Goderich, an intelligent and wellmeaning man, but totally destitute of promptitude and decision. Mr Herries, whose personal attachments bound him to the Duke of Wellington and Mr Peel, was placed in an important office. This ill-assorted shadow of a government was huddled up after the prorogation in 1827, and did not survive to meet the session of 1828. Lord Goderich resigned on the 8th of January. Some violent recrimination ensued between the parties, worthy only of ephemeral notice. One or other, or both parties, might have behaved, in fact did behave unhandsomely; but the real cause of the dissolution of Lord Goderich's government lay deeper, viz. in the very nature of its constitution.

Before proceeding to the history of his successors in office, and the fortunes of the nation under their sway, it will be necessary to revert to the proceedings of the session 1826-27; a session interrupted by two long recesses, and frittered away by vehement personal disputes.

The subject of the corn laws was almost the only one that met with serious and continued attention. The king's speech was studiously silent upon the general question, but this very silence was made a pretext for introducing it. Lord King in the House of Lords moved an amendment to the address, condemning the corn laws. Mr Western in the Commons moved an amendment to the address, calling for investigation into the state of the agricultural interest, and pointing at additional restrictions in its favour. Ministers objected to the discussion, on the ground that parliament had been summoned to meet before Christmas, not for purposes of general legislation, but to pass an act of indemnity in favour of ministers, in consequence of their having opened the ports before the averages indicated that the price of grain warranted such a step. Lord Liverpool and Mr Canning assured parliament that ministers were prepared to propose a general measure regarding the corn laws, and that they would produce it immediately after the holidays. In consequeuce of these representations, the only step taken before the close of 1826 was the passing of the indemnity act. Mr Whitmore took occasion to remark that the measure was a new proof of the absurdity of a law which they had been obliged to break thrice in the course of three years. It was intended to introduce the subject of the proposed alterations to the notice of both houses on the same evening, namely, the 17th of February.

The illness of Lord Liverpool prevented the propositions being submitted to a committee of the upper house, and Mr Canning's indisposition caused a postponement of the committee of the lower till the 1st of March. On that day the foreign secretary proposed a series of resolutions

Reign of respecting the future regulation of the corn trade, to be opposition. The Duke of Wellington asserted that his Reign of George IV adopted by the committee as the foundation of a bill. The amendment met with the concurrence of his majesty's George IV. object of the proposed measure he stated to be to afford ministers, and produced a letter from Mr Huskisson in as much protection to the land-owner as was necessary, at the expense of as little pressure upon the commercial interest as was possible. The mode in which this was to be accomplished was by imposing a scale of regulated duties upon foreign grain, rising and falling inversely with the fall and rise of prices. The medium price of wheat assumed was sixty shillings, and the corresponding duty was one pound per quarter. For every shilling wheat rose above the medium price there was to be a reduction of life, replied that he had only approved of the general printwo shillings of duty until the price reached seventy shillings, at or above which it was liable to a duty of one shilling per quarter. For every shilling wheat fell below the medium price, there was imposed an additional two shillings of duty. The duty upon other kinds of grain was in proportion, and varied upon the same principle. A duty equal in amount to the duty payable on five bushels of wheat was imposed upon every barrel of wheat-meal and flour, being a hundred and ninety-six pounds. A duty equal in amount to the duty payable on a quarter of oats was imposed upon every quantity of two hundred and fifty-two pounds of oatmeal. The averages regulating the amount of duty were to be taken weekly. Mr Canning having submitted his measure to the house, postponed its consideration for a week, in order that every appearance of precipitation should be avoided. The debate, when liament which witnessed the termination of Mr Canning's resumed, turned chiefly upon the question of too much or too little. It was waged, however, with all that pertinacity and violence which characterize the disputes of men who differ little from each other in opinion. Some concessions were made by ministers, but they were all in favour of the land-owners. Mr Hume took no part in the discussion in committee, but when the report was brought up he entered his protest against the measure. He manfully argued for a free trade in corn as in every thing else. He maintained, that if there was truth in the allegation of the land-owners, that they bore a heavier burden of taxation than the rest of the community, the proper way to afford them relief was by a countervailing duty, or the repeal of taxes. The country needed foreign grain; it could not one year with another grow enough for its own support. When the ports were sometimes open and sometimes shut, no foreign nation could rationally venture on the speculation of raising grain for the English market; the demand was too uncertain. Mr Hume suggested the imposition of a duty of fifteen shillings on foreign wheat, to decrease annually one shilling until it was reduced to ten shillings, which was to remain the permanent duty. Only fifteen members voted for this amendment. The House of Commons having approved of Mr Canning's resolutions, a bill enacting them into a law was introduced, which reached its third reading on the 12th of April, was passed, and sent to the Lords.

A strong opposition to the provisions of the bill had been mustering and threatening before it made its appearance in the upper house. Various unimportant amendments were made in committee; but one brought forward by the Duke of Wellington sealed the fate of the bill. His Grace moved, that "no foreign corn in bond should be taken out of bond until the average price of corn should have reached sixty-six shillings." This amendment, which completely altered the nature of the bill, was carried by considerable majorities, both in committee and when the report was brought up. Ministry in consequence abandoned the mutilated measure. A temporary bill was introduced by Mr Canning, lest a year should be allowed to elapse without any legal provision on the subject; and this passed through both houses without any serious

corroboration of his assertion. One expression in the letter was certainly liable to misapprehension, and might have contained the original hint of the duke's amendment; but Mr Huskisson expressly said, even of his own suggestion, that it would hazard the safety of the measure, and therefore he could not approve of it. The duke, also, when charged with having sought to defeat a measure to which he had given his assent during Lord Liverpool's ciple of it. But his measure was subversive of the principle of the bill. No wonder then that Mr Canning saw in the duke's amendment, and the hearty support it found, a personal attack. His only mistake lay in calling him an instrument in the hands of others. His previous intriguing, and his subsequent political career, show him to have been an instrument possessed of a perfect consciousness of the purposes to which he was applied. Mr Canning was thus far in the right. He was the object of the most intense animosity to the high Tories. They hated with all a woman's hatred one of the democracy who aspired to an equality with them, who they felt surpassed them in intellectual power, and who they were conscious knew that he surpassed them.

1827.

The other questions brought before the session of parcareer, were discussed with a considerable degree of listlessness and impatience. Mr Canning's vindication of the prompt interference of Britain, when Spain threatened to disturb by violence the internal arrangements of Portugal, was splendid and convincing. The establishment of a constitutional form of government in Portugal had given rise to much faction and intrigue; and there had been numerous desertions from the army. The disaffected had been well received, and allowed to organize themselves behind the Spanish frontier, and had even dared to violate the Portuguese territory. A large force of Spanish troops was mustering upon the frontier. Under these circumstances the regency, after losing some time in fruit-less negociations at Madrid, claimed the aid of England, which was frankly and promptly granted. Five thousand British troops were immediately embarked, the first division of which arrived in the Tagus on the 25th of December 1826. The course of events rendered it unnecessary for them to encounter the rebels in the field. Home affairs were discussed with the same want of keenness. On the 5th of March the House of Commons refused to entertain the question of Catholic emancipation, by a majority of four. Notices of one motion on the subject, and another for the repeal of the test act, were withdrawn immediately after the instalment of Mr Canning in the premiership, lest there should be brought about a premature collision between him and his new allies. Mr Hume's motion for the repeal of Lord Castlereagh's act against cheap publications was lost in consequence of the absence of the Whigs, and the opposition of Sir James Scarlett and others. Such was the aspect of affairs when the government of the nation was placed in the hands of the Duke of Wellington and his friends.

Lord Goderich had no sooner resigned than the king sent for the Duke of Wellington, and commissioned him to form an administration with himself at its head. His Grace immediately entered into communication with Mr Peel and others of Lord Liverpool's ministry who had seceded on the elevation of Mr Canning. The new government was speedily constructed. The Whigs were dismissed, the friends of Mr Canning remained in office, and the leading members of Lord Liverpool's cabinet return-

Reign of ed. The public were not satisfied at seeing the pertina- ably shaken. No decided steps of the minister justified Reign of George IV city with which Mr Huskisson and his friends clung to solely for the purpose of disgracing them in the eyes of the country; for, after forcing upon the House of Commons measures which obliged them, out of a regard to common decency, to declare they supported with reluctance, and merely for the sake of preserving unity in the cabinet, he took the opportunity afforded him by Mr Huskisson, when he voted for transferring the franchise of Penryn, convicted of corruption, to Birmingham or Manchester, to get quit of him, and with him of his retainers. Their places were immediately filled by creatures of the duke. The only other change made by the premier was his superseding the Duke of Clarence in the admiralty.

The Duke of Wellington found the country at peace, and looked up to as the head of constitutional Europe. The state of peace seemed to run little risk of being interrupted. The British troops dispatched to Portugal were still stationed there, but almost one of the first steps taken by the new minister was to withdraw them. The relation in which England stood to the Ottoman Porte was more delicate. From the commencement of the Greek struggle for independence till the year 1827 Britain had observed a strict neutrality between the Turks and their former vassals. The prolongation of the contest between the infuriated nations, however, promoted the growth of piracy to such a degree that the countries principally interested in the commerce of the Levant felt themselves bound to put an end if possible to the state of things in which it originated. These resolves were confirmed by their feelings of humanity, revolted by the Turkish cruelties. On the 6th of July a treaty was signed at London by the ministers of Britain, France, and Russia, declaratory of the necessity of putting an end to this sanguinary contest. The intervention of France and Britain was justified on the ground that their mediation had been requested by the Greeks. The object of the treaty was declared to be the effecting of a reconciliation between the Porte and its Grecian subjects. An armistice was to be insisted on from both parties as an indispensable preliminary to the opening of any negociation. Before the Porte could be brought to declare its sentiments with regard to this interference, Ibrahim Pacha, with the Egyptian fleet of ninety-two sail, arrived in the Morea. The British squadron under Admiral Codrington was cruizing off Navarino when this armament approached. The Porte not having yet refused to accede to the armistice, the English admiral gave the Egyptian his choice of returning to Alexandria or entering Navarino, to which in that case he must confine himself. The latter branch of the alternative was accepted. Ibrahim took advantage of the absence of the British and French squadrons to put to sea on the 30th of September, but returned to Navarino on the approach of Admiral Codrington. Chafed by these obstructions, he attacked the Greeks by land, and ravaged the surrounding districts with fire and sword. It was immediately resolved by the British, Russian, and French admirals, to enter the harbour, in the hope that their imposing attitude would induce Ibrahim to desist from his savage devastation. This movement produced an attack from several of the Turkish ships; and after a vain attempt at explanation the action became general. The Egyptian fleet was completely dismantled. It was feared that the sullen silence with which the intelligence of this disaster was received at Constantinople might eventually break out into war. If it happened that there was little reason to dread a transition from the peace which Europe was enjoying, owing to the accession of a military premier, the confidence in the liberal policy of England was consider-

the suspicions of his own country and Europe; but the George IV. office. The duke indeed seemed to have retained them lenient eye with which the proceedings of Don Miguel were regarded, and the disparaging terms applied to the action at Navarino in the king's speech, were laid hold of

as unfavourable symptoms. The first step taken by the new ministry after the meeting of parliament was to appoint a finance committee. The nomination of its chairman was the ostensible reason of that schism in the late cabinet which had caused its dissolution. On the 15th of February Mr Peel proposed "That a select committee be appointed to inquire into the state of the public income and expenditure of the united kingdom, and to consider and report to the house what further regulations and checks it may be proper in their opinion to adopt, for establishing an effectual control upon all charges incurred in the receipt, custody, and application of public money; and what further measures can be adopted for reducing any part of the public expenditure without detriment to the public service." The subject of inquiry to which the mover adverted as most worthy of the attention of the committee, and most likely to be productive of benefit, was the simplification of the public accounts. He alluded to the superior manner in which those of France and the United States were kept. This admission of the propriety of taking a lesson on such a subject from these countries, when viewed in connection with Mr Canning's declamatory opposition to Mr Brougham's motion respecting the droits of admiralty in 1820, was a most remarkable sign of the times. A minister who had opposed that very Mr Canning on the ground that he conceded too much to the innovating spirit of the age, was ready to advance before him in the path of innovation. Mr Peel's motion encountered no stronger opposition than arose from a proposal made by Mr Hume, that as one committee was inadequate to overtake the immense number of topics embraced by the proposed investigation, several should be appointed. Mr Brougham, with a view to reconcile the two plans, suggested the division of the committee into sub-committees, each taking a specific subject of inquiry. Ministers persisted in adhering to their original plan. measures of financial reform were submitted by the committee to the House of Commons during the session. The first related to the system on which government annuities were granted. Mr Perceval's bill for regulating the granting of annuities of 1808 was calculated upon Dr Price's tables. As early as 1819 Mr Finlayson demonstrated to Mr Vansittart that, in consequence of the errors of these tables, the country was losing L.8000 per month on the annuities granted by government. The demonstration, however, did not carry conviction to the mind of the chancellor of the exchequer; and even his successor Mr Robinson paid no attention to the representation. The finance committee soon convinced itself

The next undertaking of the ministry was the settlement of the corn laws. The bill introduced with their sanction adopted the principle of that proposed by their predecessors, but increased the duties imposed. Mr Charles Grant, to whom was intrusted the task of bringing forward the measure, described the enactment as the

that the annuities occasioned loss. Nothing could be done to alter those which had been already sold; but, on the recommendation of the committee, a bill was passed to sus-

pend the operation of the act under which they had been

granted, until a more correct system should be settled.

The other measure recommended by the committee was

the abolition of the office of lieutenant-general of the ord-

nance; but such a concession was not to be expected

from the Duke of Wellington.

Reign of fruit of a compromise, and confessed that he thought it from the temper of the house, that concession was the only Reign of George IV. imperfect. Some other members of the government expressed a similar opinion. The bill was finally carried by

large majorities.

While ministers were thus carrying into effect the measures originated by men with whom they had refused to co-operate, Mr Brougham was astonishing the nation with the display of a degree of legislative industry, of a mind at once indefatigable and comprehensive, that threw into the shade even his own exertions in the cause of education. On the 7th of February he directed the attention of the house to the state of the common law courts, and of the common law itself. He omitted equity in every branch, because he considered it as in some sort already taken up by parliament. For the same reason he passed over the criminal law. The inquiries pressed upon the house by Sir Samuel Romilly and Sir James Mackintosh had, it was true, been followed up timidly and on a narrow scale by Mr Peel; still the exertions of that minister were a pledge that something was to be done. The commercial law, as of modern growth, was comparatively pure. In regard to the law of real property, much had been done and more was hoped for. But to the conflicting jurisdictions, the inadequate and cumbrous forms of the common law courts, and the incongruities of the anomalous mass of consuetudinary and statutory law to which their judgments were conformed, the hand of reform had never yet been stretched out. Mr Brougham entered at great length into the constitution of the English courts, and the state of the law administered in them. For seven hours did his lucid arrangement and impressive earnestness fetter the attention of an assembly little qualified by habits or education to take pleasure in dry legal discussions. He pointed out the danger of paltry piece-meal reform, and concluded by moving an address to the throne, praying the appointment of "a commission for inquiring into the defects occasioned by time and otherwise in the laws of this realm, and into the measures necessary for removing the same." All debate on this motion was suspended until the 29th of February, when Mr Brougham substituted a modified resolution, which, with the assent of government, was unanimously carried. It prayed his majesty to take such measures as might " seem most expedient for the purpose of causing due inquiry to be made into the origin, progress, and termination of actions in the superior courts of common law in this country, and matters connected therewith; and into the state of the law regarding the transfer of real property." The field of inquiry was materially narrowed, and the prospect of efficient reform correspondingly diminished.

It has already been remarked, that the old aristocrats who rebelled against the presumption of a commoner aspiring to the chief honours of the administration, had felt themselves obliged, on their return to office, to pay homage to public feeling, and adopt the very line of policy which they had blamed in others. A more striking proof that they were merely allowed to hold the reins of government by sufferance was this year afforded in the success of the dissenters in asserting their rights. Lord John Russell moved on the 26th of February that the house should resolve itself into a committee for the purpose of taking into consideration the regulations of the corporation and test acts. A keen debate ensued, which terminated in a division, when two hundred and thirty-seven voted for the committee and a hundred and ninety-three against its appointment. This was the first successful blow aimed at the supremacy of the church of England since the revolution. The committee, notwithstanding the earnest entreaties of ministers for delay, agreed to a resolution approving of

course left open for government. A bill founded upon George IV. the resolution was introduced and read a second time without opposition. When the motion for going into committee was made, Mr Peel rose and declared, that after the decision to which the house had come, he was prepared to dismiss at once from his mind every idea of adhering to the existing law. All that he asked for was, the substitution of a declaration that the predominancy of the established church should be secured for the sacramental test. His request being complied with, the ministers withdrew their opposition to the bill, which was speedily passed, notwithstanding the tears of the Earl of Eldon.

But a more important concession to public opinion yet remained to be made by the ministers; they had, in fact, to purchase the continuance of their power at the price of a complete abandonment of all their previous professions, and the simultaneous adoption of a line of policy which they could not defend upon any principle except that of an over-

ruling necessity.

On the 8th of May Sir Francis Burdett moved for a committee of the whole house to take into consideration the claims of the Catholics, with a view to a final and conciliatory adjustment. The debate on this motion, which was continued for three evenings, ended in a majority of six in favour of the house going into committee. The resolution subsequently adopted was, that the time had arrived when a final settlement of the Catholic claims was expedient. A conference with the Lords was requested, for the purpose of ascertaining whether the sentiments of that house had undergone the same change with those of the Commons. The managers for the Lords having received the resolution, it was ordered to be taken into consideration by their house on the 9th of June. The discussion was entirely destitute of interest beyond what resulted from its being the first occasion on which the Duke of Wellington had expressed his opinion of the question at length. He grounded his opposition to concession entirely on expediency. The discussion would lead, he thought, to no practical result, and would tend only to disturb the public mind. He was desirous that the agitation of the country might be allowed to subside; and in the end it might be possible to do something, for he was most desirous of seeing the subject brought to an amicable conclusion. The motion of the Marquis of Lansdown, that the house should concur in the resolution which had been adopted by the Commons, was lost by a majority of forty-four.

Whilst the claims of the Catholics stood in the legislative assemblies "like the swan's down at full of tide, which neither way inclines," the power which was to establish justice was carrying all before it in Ireland. The Catholics had paused to see what measures would be adopted by Mr Canning; but the elevation of the Duke of Wellington set them again in motion. The first opportunity of showing their determined spirit of opposition to him was afforded by the election for the county of Clare. Mr Vesey Fitzgerald, one of the members representing that county, had vacated his seat by accepting the office of president of the board of trade when Mr Charles Grant resigned. He had uniformly given his vote and influence in favour of emancipation; but he had identified himself with the Duke of Wellington, and was esteemed no longer worthy of confidence. Besides, a new mode of annoying government had suggested itself to the fertile invention of the Association. The laws might prevent a Catholic from taking his seat in parliament, by ordering that an oath should be tendered to him when he appeared to claim his right of sitting; but they did not forbid his being returned to serve. Taking advantage of this omission would afford the administration the instant repeal of the obnoxious acts. It was evident, a test of the absolute sway which the Association exer-

George IV. O'Connell was proposed as a candidate for the honour of gerald. Emissaries of the Association were dispatched to every barony and parish of the county. The priests, with one exception, exhorted their flocks to vote for the advocate of their rights. A fund was prepared to pay up the arrears of all tenants distrained on account of the votes they might give, upon their finding security for repayment within a reasonable time. The day of election came. Mr Fitzgerald threatened the voters with the displeasure of their landlords. "Is it," he asked, "the payment of an arrear of rent by any body of men that will compensate to the unfortunate peasant for being deprived of his natural protector? Is it the payment of a few pounds that can compensate to the unfortunate peasant for the total alienation of his landlord? When the poor man is sick, men be, who, to gratify a public, perhaps a private, pique, burst the bonds which for years have bound together the landlord and tenant by what was considered an indissoluble tie? Alas! they will be far distant; and the unfortunate tenant will have nobody to look to for relief and comfort, except that landlord whom he is now called upon to desert." Mr O'Connell, on the other hand, dwelt upon the utter hopelessness of good legislation for Ireland so long as the people were not represented. He expatiated shrunk back from asserting them in person, and were willing to receive them from the bounty of a patron. He reminded his hearers of the unjust and unequal taxation under which they were labouring. He warned government that "the young blood of Ireland was in a ferment." The result of the election proved that the Catholics of Ireland had determined to rely upon their own efforts alone. The tenantry had awakened to a sense of their degraded situation; a race of paupers tolerated in the land because once in seven years they were of use, and allowed to perish of hunger and cold except when it became necessary to win assert their right to equal laws and legislative attention to their interests. This spirit was mainly owing to the efforts of the Association; and to the credit of the gentlemen composing that body, a spirit of forbearance from violence had likewise been fostered in the peasantry. Notwithstanding the violence of party feeling, the Clare election was attended with less outrage than the average of standing a protest taken by some of the freeholders, was declared duly elected.

In the month of July the law which had been directed against the Catholic Association expired, and that body immediately re-assembled in its original form, to improve the victory it had gained in Clare. They issued an enumeration of four pledges to be required of every person who should at any time come forward as candidate for a seat in parliament. By the first he was to bind himself to oppose the Duke of Wellington's ministry in every thing until emancipation was conceded; by the second, to support religious and civil liberty; by the third, to procure the repeal of the sub-letting act; and by the fourth, to support reform in parliament. It was declared that every canby the men, influence, and funds of the Catholic Association. The next step was to organize local clubs. These bodies speedily spread throughout the three southern provinces, and embraced in their number many of the higher as well as of the lower orders. As far as possible, a club was instituted in every parish, consisting of the principal

Reign of cised over the tenantry of Ireland. Accordingly Mr mers as could read. The club was to meet monthly. It Reign of was to keep a register of all electors within its bounds; to George IV representing Clare in parliament, in opposition to Mr Fitz- have every man in readiness for future elections; and to promote good order, perfect subordination to the laws, political knowledge, and liberal feeling, as much as possible. Every club was to report once in three months to the secretary of the Association, and to receive a weekly paper for a weekly contribution of three pence. Aggregate meetings of these clubs were held during the autumn in the provinces of Leinster and Munster, and countenanced by many of the aristocracy. The party feuds which raged among the peasantry, and occasioned unintermitting scenes of riot and bloodshed, were hushed at the bidding of the Association. The superfluous flow of Irish animal spirits was turned from the path of crime, and concentrated for the achievement of a great national conquest. Well might Mr Shiel say-" What has government to dread from our and his family famishing with hunger, where will those resentment in peace? An answer is supplied by what we behold. Does not a tremendous organization extend over the whole island? Have not all the natural bonds by which men are tied together been broken and burst asunder? Are not all the relations of society which exist elsewhere gone? Has not property lost its influence has not rank been stripped of the respect which should belong to it—and has not an internal government grown up, which, gradually superseding the legitimate authorities, has armed itself with a complete domination? Is it upon the impossibility of men achieving their rights who nothing that the whole body of the clergy are alienated from the state, and that the Catholic gentry, and peasantry, and priesthood, are all combined in one vast confederacy? So much for Catholic indignation while we are at peace; and when England shall be involved in war----I pause; it is not necessary that I should discuss that branch of the division, or point to the cloud which, charged with thunder, is hanging over our heads."

The first symptom of intimidation on the part of the supporters of Protestant ascendency, was Mr Dawson's speech at a public dinner in Londonderry on the 12th of August. This gentleman was a minister of the crown, their voices at an election. They were determined to brother-in-law of Mr Peel, the leader of the Anti-Catholic party in the House of Commons, and himself distinguished for more than ordinary vehemence in opposing Catholic claims. He now declared that his sentiments were changed; that there was but one alternative, either to crush the Association, or to settle the question; that the for-

mer was impossible, the latter inevitable.

The bigots of the Protestant ascendency were on their English county elections; and Mr O'Connell, notwith- part no less active. No sooner had the act against illegal societies expired, than the Orange lodges were revived, and the grand Orange lodge in Dublin again opened. New associations were formed in various parts of the country, but particularly in Dublin and Ulster, under the name of Brunswick clubs. A Protestant rent was collected in emulation of the Catholic rent. The mass of the Irish population seemed arrayed into two mighty and adverse armies. Men's minds grew heated, and the war-cry of religious intolerance rose fiercer and fiercer. The Protestant friends of emancipation began to hold back from the Association. The mania of Brunswick clubs spread to England, and the spirit first showed itself in Kent, at a great meeting on Pennenden Heath. The Catholics in England were few; the question of emancipation was there didate refusing to take these pledges should be opposed regarded with comparative indifference; and there was a possibility of the prejudices of the lower orders being inflamed, and the Catholic claims made a ground of blind enmity between the sister islands.

The silence and inactivity of ministers while this storm was gathering merited the taunt of Mr Shiel. " Meanwhile the government stands by, and the minister folds gentry, clergy, churchwardens, and such respectable far- his arms as if he were a mere indifferent observer, and

George IV amusement of his official leisure. He sits as if two gladiators were crossing their swords for his recreation. The cabinet seems to be little better than a box in an amphitheatre, from whence his majesty's ministers may survey the business of blood." The truth was, that the members of the cabinet were irresolute, and divided among themselves, and that the king was unmanageable. His pride was hurt at the opposition to his sovereign will, displayed in the proceedings of the Association; and his worn-out and irritable constitution was stung to frenzy by the interruption of his pleasures. The Duke of Wellington, in a communication to the Marquis of Anglesey, dated the 28th of September, told the lord-lieutenant that the Catholic question was "a subject of which the king never hears or speaks without being disturbed." On the 11th of November the duke wrote to the same nobleman:-" I cannot express to you adequately the extent of the difficulties which these and other occurrences in Ireland create, in all discussions with his majesty. He feels that in Ireland the public peace is violated every day with impunity, by those whose duty it is to preserve it, and that a formidable conspiracy exists, and that the supposed principal conspirators-those whose language and conduct point them out as the avowed principal agitators of the country—are admitted to the presence of his majesty's representative in Ireland, and equally well received with the king's most loyal subjects." Again, on the 19th of November:—"I might have at an earlier period expressed the pain I felt at the attendance of gentlemen of your household, and even of your family, at the Roman Catholic Association. I could not but feel that such attendance must expose your government to misconstruction; but I was silent, because it is painful to notice such things. But I have always felt, that if these impressions on the king's mind should remain, and I must say that recent transactions have given fresh cause for them, I could not avoid to mention them to you in a private communication, and to let you know the embarrassment you occasion.'

The silence and inaction of the duke, circumstanced as he was, were unavoidable. They tended, however, to precipitate the final issue. Dr Curtis, the Catholic primate of Ireland, had long cultivated an intimacy with the Duke of Wellington, which had its origin in some important services rendered to the army in Spain, the doctor having held a high office in the university of Salamanca. He availed himself of the footing on which he stood with the premier to address to him a letter on the state of the country, and the importance of settling the Catholic ques-The duke's reply was in these words:--" I assure you that you do me but justice in believing that I am sincerely anxious to witness the settlement of the Roman Catholic question, which, by benefiting the state, would confer a benefit upon every individual belonging to it. But I confess that I see no prospect of such a settlement. Party has been mixed up with the consideration of the question to such a degree, and such violence pervades every discussion of it, that it is impossible to expect to prevail upon men to consider it dispassionately. If we could bury it in oblivion for a short time, and employ that time diligently in the consideration of its difficulties on all sides (for they are very great), I should not despair of seeing a satisfactory remedy." A copy of the duke's letter was forwarded to Mr O'Connell, and received by him and the Association as a declaration that the minister was no longer unfavourable to the Catholic claims. A copy of the letter was likewise transmitted to the Marquis of Anglesey. In his reply to Dr Curtis the marquis pointed out that the duke could only be considered as wavering

Reign of the terrific contest only afforded him a spectacle for the guage as might further conciliate him; and earnestly dis-Reign of suaded from every appeal to brute force. The most re-George IV. markable passage in the letter was the following:-"I differ from the opinion of the duke, that an attempt should be made to bury in oblivion the question for a short time. First, because the thing is utterly impossible; and next, if the thing were possible, I fear that advantage might be taken of the pause, by representing it as a panic achieved by the late violent re-action, and by proclaiming, that if the government at once and peremptorily decided against concession, the Catholics would cease to agitate, and then all the miseries of the last years of Ireland will have to be re-acted. What I do recommend is, that the measure should not for a moment be lost sight of—that anxiety should continue to be manifested—that all constitutional (in contradistinction to merely legal) means should be resorted to to forward the cause; but that, at the same time, the most patient forbearance—the most submissive obedience to the laws-should be inculcated; that no personal and offensive language should be held towards those who oppose the claims." This letter was produced at a meeting of the Association, and received with the warmest encomiums. The next wind that blew from England brought the mandate recalling the Marquis of Anglesey, and appointing the Duke of Northumberland to succeed The rage of the Catholics was unbounded, as their hopes had been premature. The storm howled more loudly than ever.

1829.

Wellington's resolution was at last fixed. It may be that pride had some share in prompting his resolves. was known, or believed, that in his own person he had no great objections to concede what was claimed by the Catholics; and he was not a man to defer to the prejudices of others, however high in station, although he might to The danger was too imminent to allow him to hesitate longer. Having secured the assent of his colleagues, and wrung his slow leave from the king, he prepared to force upon parliament a measure which it had often with seeming loathing rejected. The session of 1829 was opened on the 5th of February by a speech from the throne, which contained the following unwonted expressions:- "His majesty recommends that you should take into your deliberate consideration the whole condition of Ireland; and that you should review the laws which impose civil disabilities on his majesty's Roman Catholic subjects. You will consider whether the removal of these disabilities can be effected consistently with the full and permanent security of our establishments in church and state, with the maintenance of the reformed religion established by law, and of the rights and privileges of the bishops and of the clergy of this realm, and of the churches committed to their charge. These are institutions which must ever be held sacred in this Protestant kingdom, and which it is the duty and determination of his majesty to preserve inviolate. His majesty most earnestly recommends to you to enter upon the consideration of a subject of such paramount importance, deeply interesting to the best feelings of his people, and involving the tranquillity and concord of the united kingdom, with the temper and the moderation which will best insure the successful issue of your deliberations." The Anti-Catholics were not taken by surprise, for it had been whispered about, a few days before the meeting of parliament, that ministers intended to recommend concessions to the Catholics. But they were not yet sufficiently masters of the course intended to be pursued by the duke to organize an effective opposition, and their first burst of discontent is unworthy of being recorded.

The first measure of the ministry was one of punishin his previous opinions; advised the adoption of such lan- ment to the sturdy beggars whose importunity had ex-

Reign of torted their charity. The Catholic Association was de- worship; no Catholic prelate was to assume the name and Reign of trumpets was followed up by a bill, which Mr Peel introduced on the 10th of February, to terminate the existence of the Association. He proposed to give to the lordlieutenant, and to him alone, the power of suppressing any association or meeting which he might think dangerous to the peace, or inconsistent with the due administration of law; together with the power of interdicting the meeting of any assembly of a similar character, of which previous notice had been given. In case it should be necessary to enforce the provisions of the law, the lord-lieutenant was authorized to select two magistrates, for the purpose of suppressing the meeting, and requiring the people to disperse. Finally, every meeting and association which fell under the provisions of the act were prohibited from receiving and placing at their disposal any monies, by the name of rent, or any other name. The operation of the act was limited to the end of the then next session of parliament. This bill met with no opposition. The friends of the Catholics regarded it as a part of the system of emancipation—as a concession to the wounded feelings of men in power. Their adversaries were pleased even with this dying blow at the Association. Several members who voted felt themselves called upon to apologise for supporting the bill; whilst others taunted them for not having introduced such a measure before. It received the royal assent on the 5th of March; but the Asblow struck for the gratification of offended vanity was lost in the empty air.

On the same day that the bill aimed at the Catholic Association received the royal assent, Mr Peel moved in the House of Commons that the house should resolve itself into a committee on the laws which imposed disabilities on the Catholics. A call of the house had been moved for that day, and the consequence was an unusually crowded attendance. The speech with which the home secretary prefaced his recommendation of the ministerial measure had two remarkable features. In the first place, every fact that he stated as influencing the decision to which he had come, must have been known for years, or he must have been unfit for his office. In the second place, while confessing that the object of the measure was to mediate between contending interests, he conceived it necessary for the honour of government to affect a stern disregard of all. His reasons for yielding to the Catholic claims were, That the evils of divided councils were palpably so great, that something must be done to form a government with one common opinion on the subject; that a united government must either grant further political rights to the Catholics, or deprive them of those they already possessed; and that the latter alternative was impossible. Having made up their minds to bring back the Catholics within the pale of the constitution, ministers wisely brushed off all the incumbrances with which the concession had from time to time been surrounded, with the view of assuring alarmists. great object of the measure was to abolish civil distinctions, and establish equality of civil rights. Catholic, when promoted to office, was only called upon to swear allegiance in the usual terms; to disclaim the deposing power of the pope; and to abjure any intention of employing his privileges to weaken the Protestant religion or government. The only offices from which Catholics were excluded were that of lord-lieutenant of Ireland, that of lord high chancellor, and appointments in any of the universities, colleges, or ecclesiastical schools.

George IV. nounced in the king's speech as dangerous to the public, title of any dignitary of the church of England; and the George IV. and inconsistent with the constitution. This flourish of names and numbers of the individuals composing monastic societies were to be registered. Making allowance for the necessity of gilding the pill in order that it might be swallowed, the measure was as liberal as could be desired. It was, however, beyond the power of the narrow-minded faction into whose hands fortune, in one of her freaks, had placed the office of effecting this great act of justice, to have kept it pure from every indication of their own want of magnanimity. The provision that the oath recited in the act, and no other, should be taken by a Catholic, was expressly limited to the case of "any person professing the Catholic religion who shall, after the commencement of this act, be returned as a member of the House of Commons." This specification was evidently levelled against Mr O'Connell, who had been returned for Clare before "the commencement of this act;" and was worthy of the temper that punished the Catholic Association at the very moment it confessed that that body had demanded no more than justice. Ministers had been terrified into an honest action, and were determined to show their resentment by performing it with as bad a grace as possible.

The burden of defending the measure fell upon the recently-converted ministerialists; the old and tried friends of emancipation contenting themselves with throwing in an occasional word of encouragement to their new allies. The line of argument adopted by all was much the same as that made use of by Mr Peel. The opposition was sociation had already declared itself dissolved. The last characterized rather by a dogged and sullen pertinacity, than by debating talent. The speakers had followed the lord of the ascendant; and the only things which enlivened the dulness of the minority were some very bitter sneers at the deserters. The main argument relied upon was, that a majority of the nation were opposed to concession. Ministers were repeatedly challenged to appeal to the sense of the country by a dissolution of parliament. But they who urged such reasons knew very well, that, as parliament was then constituted, a new election would not have expressed the sense of the nation. They knew, that even though England and Scotland had been bigoted enough to wish to rivet the fetters of the Catholics, Ireland had still a right to appeal from their decision. Ireland was all but unanimous on the question; -Ireland was the principal party interested;—Ireland had assented to the union, under the conviction that emancipation was to be conceded;-Ireland had a right, if it was withheld, to demand the repeal of an alliance into which she had entered on the faith and understanding that the removal of the Catholic disabilities and an equality of civil rights would be amongst its earliest fruits. Parliament was certainly not the fairest tribunal; but, in the circumstances of the case, it was perhaps the best that could be had recourse to.

> The majority in the committee, three hundred and forty-eight for the motion, and a hundred and sixty against it, decided the fate of the measure in the Commons. No important variation in the relative numbers occurred during the remaining discussions, neither was any new argument adduced. The speakers came forward for the purpose of recording their own opinions, not with the hope of influencing those of others. The bill was carried up to the Lords, and read a first time on the 31st of March.

In this house the demands of the Catholics had hitherto met with the most determined and uniform resistance. Its members were men of high feelings, of personal honour, and independent circumstances. They were contemplated by the panegyrists of the constitution as the representatives of what was permanent in the English frame of go-No official insignia were to be borne to a Catholic place of vernment, and as the check upon the over-hasty resolves of

George IV. dexterity in following the veering inclinations of the minister as their humbler colleagues in the task of legislation. On the 11th of June 1828 a majority of forty-four refused even to entertain the question of the Catholic claims. On the 10th of April 1829 a majority of a hundred and four passed a bill granting every thing that the Catholics asked for. The debates were equally lengthy and unsatisfactory with those in the lower house. The bill received the royal assent on the 13th of April.

The bill which admitted Catholics to both houses of parliament, and to almost every office of political power, trust, and emolument, was accompanied throughout its progress by another bill for disfranchising the whole body of forty-shilling freeholders in Ireland. This measure, as described by Mr Peel, restricted the possession of the elective franchise to the possessors of a real ten-pound freehold. This restriction did not extend to corporate towns; for had the franchise been raised within their jurisdictions to ten pound, the corporations could have overpowered the public voice by their right to make freemen. The bill fixed a day for the opening, in every county in Ireland, of a bona fide register of ten-pound freeholds. An act of more flagrant injustice was never perpetrated. The landlords finding that the serfs, whom they had bred for electioneering purposes, had emancipated themselves, threw them carelessly away. The wealthier Catholics had served their own purposes, and abandoned those who had fought their battles. The Irish forty-shillings freeholder had as good a title to his elective franchise as the proudest nobleman to his barony. He might be all that his calumniators represented him, but the fault lay in the system under which he was born, and in the ambitious landholders who had made it an engine to serve their own selfish purposes. He was punished for having rescued himself from the degradation of being a mere unthinking tool. Lords Duncannon and Palmerston, and Mr Huskisson, deserve to be had in remembrance for having raised their voices against this filching of men's rights. Only seventeen members voted against the bill in the Commons, and scarcely a murmur was heard from Ireland when it passed into a law. And thus a question which had vexed the nation for half a century was set at rest.

No other question of importance succeeded in arresting the attention of parliament during this agitated year. Even the budget was hurried over without its due allowance of wrangling. On the 24th of June parliament was prorogued, in order that the nation and the government might have time to reflect upon their novel situation.

The ceding of the Catholic claims was the last important act of the reign of George IV. The ministers gained by this desertion of their professed principles what every body of men adopting a similar line of conduct may reasonably expect, the enmity of their former friends, and a cold distrustful toleration at the hands of their former opponents. The country was partially disquieted during the autumn and winter of 1829. The labourers were suffering in many places from want of employment, and distress to a considerable extent was insinuating itself among the agricultural classes. England's productive powers continued unabated, and the prevalence of want showed that there was something wrong in her internal arrangements, interfering with the natural tendency of wealth to diffuse itself. In Ireland public tranquillity was far from being re-established, nor was such a consummation reasonably to be hoped for from the redress of one grievance alone in a country which had been governed for centuries by men ignorant of its wants and feelings. The boon of emancipation had been attended, as we have seen, by an act of injustice and a gratuitous insult. The former was

Reign of a popular assembly. Yet they evinced as much haste and scarcely remembered in the hour of triumph, but it afford- Reign of ed a topic for declamation when the hour of agitation George IV. should arrive; and the latter sent back to Ireland, as the avowed and embittered enemy of government, the man who had more power than any other over popular feeling. O'Connell's progress through Ireland was a continued triumph. His re-election for Clare was not contested. And wherever he went he held out ministers to the popular odium, recounting all their misdeeds, real or imaginary, and appealing in turns to every passion that could be supposed to animate the peasant. The Orangemen, on the other hand, galled by the loss of their ascendency, continued to vociferate empty menaces, which had at least the effect of producing irritation. The waves of popular hatred and prejudice continued to dash after the storm that raised them had blown over.

Amidst all this trouble, a conviction began to gain ground that ministers were unequal to the task of carrying on the government. It was apparent, indeed, that they had chalked out for themselves no system by which to regulate their conduct. They undertook nothing of their own accord, and they adopted almost every suggestion which was made to them by others. Nor was this strange. With the exception of some inferior officials, men trained in the discharge of routine duties, but who could only execute a task prescribed to them, there was not amongst them one man who had a knowledge of public business. The leaders were of that unyielding aristocratical party which had revolted at the idea of following the leadership of a man like Mr Canning. They believed that the honours of the state belonged to them in virtue of their birth, and they managed to secure these by influence and intrigue; but they could not use the power which they had succeeded in acquiring. Masters of their own wishes alone, they stared idly around, asking what they were to do next. The dilemma in which they had involved themselves soon became visible to every eye, and its effect was to revive dormant feelings. At the commencement of the reign of George IV. parliamentary reform was loudly called for by two bodies of men; by the Whigs, with whom the belief of its necessity partook largely of the character of a theoretical tenet; and by the radicals, who, without correct or extensive views, felt that something was wrong, and stumbled upon the remedy. The conciliatory policy of the cabinet after the accession of Mr Canning deluded the nation with the hope that an efficient and enlightened government might be obtained even under the old system; and the cry of reform was stilled for a time. But the intrigues by which it was sought to keep Mr Canning out of the premiership, and the success with which they were employed after his death, revived the conviction that an enlightened ministry, acting for the national good, must remain weak, unless, by parliamentary reform, the body of the people obtained a more direct control over the executive. This spirit, to which subsequent events soon imparted a more determined character, was rapidly spreading when parliament re-assembled in February 1830.

The ministers were conscious that they did not command a majority of the house. The old Tories stood in an attitude of avowed hostility. The Whigs lent a patronising but uncertain support. The Duke of Wellington, however, flattered himself that the incompatible principles of these two parties would keep them from coalescing against him. He dreamed of receiving alternate assistance from both, and, by playing off their mutual jealousy, of avoiding the necessity of throwing himself into the arms Thus situated, his conduct was marked with the same tinge of feebleness as during the preceding session. When any measure to which he was averse was energetically pressed upon him, he evaded the appearance of a defeat by introducing one slightly varied in form, but

large augmentations had taken place in the salaries and pay of persons in civil and military employments, on account of the diminished value of money; and whereas the alleged reason for such augmentations had ceased to operate, in consequence of the passing of 59th George III., which restored a metallic standard of value; it was expedient, in order to relieve the country from its excessive load of taxation, to revise our present system of expenditure, for the purpose of making every possible reduction that could be effected, without violation of good faith or public justice." This motion was opposed by ministers; but, in the temper of the house, it was judged expedient merely to substitute a motion to the following effect:-"That whereas his majesty has been graciously pleased, &c. to assure the house that he would cause an inquiry to be made into all the departments of the civil government, with a view of reducing the number of persons employed, and the amount of the salaries paid; resolved, that an humble address be presented to his majesty, that his majesty might be graciously pleased to lay before the house an account of the progress which had been made in such inquiry: also, that it was the opinion of the house that, in every establishment of the state, every saving ought to be made consistently with the due performance of the public service, and without the violation of existing engagements.' Ministers did not insist upon taking the lead; they only asked leave to walk foremost. So that they rode on the crest of the billow, they cared not in what direction it was

A variety of subjects forced on the attention of parliament, confirmed the fact that men's minds were full of doubts and questionings. Lord Stanhope moved for an inquiry into the state of the nation. Mr P. Thomson moved for a committee to revise the whole system of taxation. The question of the East India charter was unavoidably brought forward. Parliamentary reform was suggested in the most various forms, and from the most unexpected quarters. The Marquis of Blandford, once a vio-lent Tory, proposed, on the 18th of February, the appointment of a committee by ballot, to take a review of all the boroughs and cities in the kingdom, and to report to the home secretary such as had fallen into decay or forfeited their right to representation. That minister was immediately to relieve these places from the burden of sending members to parliament in future, and to fill up the vacancies by towns hitherto unrepresented. The elective franchise was to be enjoyed by all persons paying scot and lot. The plan of the marquis contemplated the revival of the custom of paying wages to members in parliament. Lord John Russell moved, on the 23d of the same month, for leave to bring in a bill to enable Leeds, Manchester, and Birmingham, to return members to the House of Commons. Mr O'Connell brought his plan of reform before parliament on the 28th of May. He moved for leave to bring in a bill to Russell submitted two resolutions to the house, first, "That it was expedient the number of representatives in was expedient to give members to the large manufacturing towns, and additional members to counties of great wealth and population." All these schemes were negatived by

Reign of of the same tendency. On the 12th of February, Sir formers,—had not come to a right understanding with each Reign of George IV. James Graham moved a resolution to the effect—"That other. But taken in connection with the voice of the pub-George IV. whereas subsequently to the act of the 37th George III., lic out of doors, they showed that the cry for reform, siby which a suspension of cash payments was effected, lenced for a while, was again rising with increased urgency, and that an extensive change in the constitution of the House of Commons could not much longer be evaded.

At this ominous crisis George IV. breathed his last. He had long been in an infirm state, but no immediate danger was anticipated till the commencement of April. On the 15th of that month the first bulletin was issued. He continued to grow weaker, and latterly the slightest exertion became intensely painful. A message was sent to both houses of parliament on the 24th of May, stating that his majesty found it painful to sign with his own hand documents which required his sign-manual, and requesting parliament to provide for the temporary discharge of that function of the crown. A bill was immediately passed, allowing the sign manual to be adhibited by a stamp. The disease continued to run its course, and upon the 26th of June his majesty expired.

George IV. had no public virtues. He is said to have possessed a taste for the arts and for letters; and the instances which have been given of his attachment to the latter indicate a pretty correct estimate of the merits of some lighter works. In the rich and voluptuous decoration of apartments he excelled. In painting, his taste does not seem to have gone beyond a feeling of elegant execution, and a recognition of strongly-expressed character. Neither science, literature, nor art, found in him a very active patron; and he took but little interest in the affairs of government. He was at one time in habits of intimacy with the Whigs; but finding their opponents firmly seated in power, he allowed them to remain. The character of his minister, and the course of policy adopted by him, were comparatively indifferent, provided the royal repose was left undisturbed. His habits were retired, and he shrunk from every species of annoyance. This was perhaps rather the result of exhausted energy and constitutional decay, than of self-indulgence, or haughtiness of character. Yet, upon public occasions, he was fond of display and parade. He could enjoy the pageantry of monarchy, though he shrunk from its more laborious duties. The spectacle of a gorgeous coronation had greater attractions for him than even the solid possession of kingly power. On some points, however, where his own private feelings or opinions were concerned, he was firm, even to obstinacy. Hence he risked the peace of the empire to get rid of an obnoxious queen; and he resisted all concession to the Catholics, until the urgency of danger compelled him to yield. But there was something engaging in his appearance, which made him popular whenever he showed himself amongst his people; his manners were confessedly those of an accomplished gentleman; and though fastidiously jealous of his royal dignity, his habits were social and agreeable.

Yet his reign was not uneventful. It commenced at the close of the extensive wars which had desolated Europe. The nation, no longer engrossed with its own exploits in foreign lands, but deranged as to its internal economy by a long-continued struggle, was forced to turn establish triennial parliaments and vote by ballot, and its eyes inwards. The consequences of this reflex study extend the franchise to every man who paid a tax or was developed themselves slowly. First the government shook liable to serve in the militia. The same day Lord John itself free from the alliance of despots; and next endeavoured to check the gambling spirit of trade, by giving a healthy and substantial character to the currency. A the house should be increased;" and secondly, "That it more frank and liberal intercourse with other nations was encouraged. Retrenchment of state expenditure, and an equable apportionment of national burdens, were loudly demanded, and in outward show at least attempted. The large majorities, and their discordant nature showed that old inadequate customs of the law began gradually to rethe reformers,—for the old parties of Whigs and Tories cede before a more rational system. The unalienable had now well nigh merged into reformers and anti-re- right of a nation to regulate its internal concerns without

Reign of foreign interference was recognised. It was not to be ex-William pected that such important changes could be effected without exciting individual discontent, and causing individual suffering. The consequent discussions led men to inquire into the distribution of power and privilege. The rights of citizens were warmly asserted. The equal political rights of all religious denominations were conquered. The adherents of rational principles of government felt their strength, and prosecuted their assaults upon antiquated prejudice and abuses with more vivacity. This period of preparation was terminated by the death of George IV. The seeds of future activity were germinating in silence. The unsettled state of men's minds was as a chaos, upon which the news of the expulsion of the Bourbons from France descended like an animating spirit. The huge mass heaved at once with the throes of new life. The first fruits have been the achievement of parliamentary reform.

William IV. ascended the throne of Great Britain on the 26th of June 1830. The change of the monarch did not occasion any immediate change in the state of public affairs. The Duke of Clarence had accepted office under Mr Canning, and had been rather unceremoniously deprived of it by the Duke of Wellington; hence some people augured that he would be unfavourable to his ministry. In the political world he was scarcely known. An old grudge existed against him from the time of the queen's The Tories, who more than half feared his revolt, spread caricatured accounts of the proceedings at Bushy

House during his brother's illness. The plainness of the Reign of new king's manners, however, soon rendered him highly popular. He mingled with the people, and his familiar address and unostentatious appearance contrasted so strongly with those of the late king, that he completely won the affections of that part of the community which, as it is the first to deify a monarch, is also the first to cast him off No change, however, took place in the ministry. William IV. declared himself friendly to their policy, and determined to retain them.

They were, however, incapable of being much longer sustained in office, even by the royal support. The party which they had irritated by carrying the Catholic bill was strong in the Commons, and stronger in the Lords. The Whigs had lost confidence in the Duke of Wellington and his coadjutors, whose system of policy was temporising, calculated to keep themselves in power, but not to forward the business of the country. It was evident that every measure having in view the better organization of the state must be wrung from them, like Catholic emancipation, by demonstrations of power. War was in consequence declared against the cabinet, and prosecuted vehemently by the Ultra-Tories, but by the Whigs with more caution. The first question that gave rise to serious discussion was, whether the parliament, after voting such supplies as were immediately necessary, should be at once dissolved, or whether provision ought first to be made for a regency in the event of the king's demise before the re-assembling of that body. Ministers obtained a small majority after a violent debate. A few matters of business which could not be postponed were afterwards hurried through the house with little opposition, and on the 23d of July parliament was prorogued by the king in person; and being next day dissolved by proclamation, writs were issued for the election of a new one, returnable on the 14th of September.

A few days afterwards the news of the revolution, by which the elder branch of the Bourbons was finally expelled from France, reached England. The intelligence, as already mentioned, had a powerful effect. The delusion which the conciliatory policy of Canning had occasioned, and the belief that an enlightened and energetic government was attainable under the old rotten system of parliamentary election, had received a severe shock from the circumstances of his death. The liberal measures into which the Duke of Wellington had reluctantly been forced, had for a short time delayed the disabusing of the nation. But late events had shown that nothing was to be expected from him and the men of mere routine who formed his ministry. The longing for parliamentary reform returned with redoubled efficacy. Men were not prepared with any definite scheme, nor were they agreed as to the principles upon which they vindicated the justice of innovation. The news of the three days in Paris ripened men's views, and showed that wishes were useless whilst unproductive of action. The French received the homage of universal sympathy. This circumstance was turned to use by some active friends of liberty. Meetings were called in every important town to congratulate the freemen of France; and thus reformers were brought together, and taught how numerous a body they were.

All these circumstances operated unfavourably for ministers at the elections. Wherever the election was popular, the reformers supported a candidate of their own principles; and of the close burghs, with the exception of those commanded by government, a decided majority were in the hands of the Duke's adversaries. The suspicions under which his administration lay, of coqueting with Prince Polignac, materially augmented its unpopularity. Not one candidate appeared on the hustings to claim the

Reign of suffrages of the electors as a supporter of ministers. The everywhere established. The most important of these Reign of William general result of the election diminished by fifty the bodies were the Birmingham union, the model of all the William votes upon which the government could depend.

At the same time the disturbed state of the country, by showing the incapacity of government, went far to swell the ranks of its enemies. Ireland had not been pacified, because the concession of its claims had been accompanied by personal insult and perseverance in a hostile attitude. Emancipation had never been demanded by any reasonable man as a measure that could do good further than by allaying religious feuds, and bringing the nation to a temper in which an honest government might with rational hopes of success look for support in pursuing measures of reform. But, on every question that regarded Ireland, government evinced a hostile spirit, the growth either of ignorance or bigotry. The cry for the repeal of the union was again raised, and a society established, bearing the title of "The Friends of Ireland of all religious denominations." This body announced its determination to agitate till every one of its objects should be conceded. The most essential of these were, a repeal of the sub-letting act, a radical reform in the representation, and a repeal of the union. Mr O'Connell was at the time absent in England; and there being no other man of his party equally fertile in resources and undaunted in pertinacity, the lord-lieutenant easily suppressed the new association under the act passed along with that which admitted the Catholics to a participation in the privileges of the constitution. But no sooner did the dissolution restore O'Connell to Ireland than he engaged in re-organizing his adherents into an "Anti-Union Association." This society was likewise prohibited by proclamation of the lord-lieutenant, but was succeeded by the "Association of Irish volun-teers for the repeal of the Union." Many who had hitherto acted with Mr O'Connell, felt the necessity of a legislative union with England, and took alarm at these proceedings. A numerous meeting, convened by the Duke of Leinster, declared their adherence to the union. After this step the lord-lieutenant's proclamation directed against the volunteers was obeyed, nor was the repeal of the union proposed at any of the elections as a test to candidates.

Even England began to rival Ireland in misery and disturbances. While parliament continued to sit, its table was covered with petitions, describing in the strongest terms the distress suffered by the lower classes engaged in agriculture. It was predicted that unless a change for the better took place it would be impossible to restrain them from outrage. The harvest was scarcely concluded when this prophecy was fulfilled. The disturbances began in the county of Kent. Threatening letters were dispersed throughout the county, machinery destroyed, money extorted, and barns and stack-yards set on fire. The commotions were the wild aimless efforts of men suffering almost beyond nature and without hope. Viewing the matter in this light, the first rioters apprehended were treated with a degree of lenity which encouraged fresh outrages. During October, November, and December, the riots increased in frequency and boldness, and spread from Kent into Hants, Wilts, Bucks, Sussex, and Surrey. The frame of civil society seemed breaking up, and a wild deluge of human passion, untamed by moral feeling, uncheck-

ed by law, threatened to overwhelm all. With a nation apparently resolving into anarchy, and a

government helpless and stubborn, there was no hope. Like sailors in a shipwreck, men began to search for something to cling to in the impending convulsion. The demand for reform was raised more clamorously than ever. Political unions and reform associations, having for their object the propagation of definite political principles, and a demonstration of the physical strength of the reformers, were

others; the great northern union, extending over the counties of Northumberland and Durham; and the Renfrewshire political union. But others of less note were to be found in almost every town and village in the kingdom.

Such was the threatening aspect of the country when parliament opened on the 2d of November. The speech from the throne contained no indications of the means by which ministers proposed to meet the threatening emergency. It was simply announced in regard to France, that "the elder branch of the Bourbons no longer reigned," and that "the Duke of Orleans had been called to the throne by the title of King of the French." events in Belgium were branded with the title of "revolt." The disturbances among the peasantry were attributed to " efforts industriously made to excite discontent and disaffection." A determination was expressed to exert every means which the constitution had placed at the king's disposal for the repression of outrage. No distant allusion was made to that reform which the nation demanded as with one voice. The ministerial declaration showed that the Duke of Wellington, in proud ignorance, was determined to cling to a system whose props one after another

had for years been dropping down.

Any doubt that remained upon this subject was removed by the debate which took place in the House of Lords when the address to the throne was moved. Earl Grey, adverting to the opprobrious designation applied in the king's speech to the Belgian revolution, observed,-"We ought to learn wisdom from what was passing before our eyes. He felt persuaded, that unless reform were granted, we must make up our minds to witness the destruction of the constitution. He had been a reformer all his life, and at no period had he been inclined to go farther than he would be prepared to go now, if the opportunity were offered." The Duke of Wellington's reply to this portion of this speech is only memorable by the declaration made in it, which occasioned his subsequent downfal. "The noble earl has alluded to something in the shape of a parliamentary reform, but he has acknowledged that he is not prepared with any measure of reform; and I have as little scruple to say, that his majesty's government is as totally unprepared as the noble lord. Nay, on my own part, I will go farther and say, that I have never read or heard of any measure up to the present moment, which could in any degree satisfy my mind that the state of representation could be improved or rendered more satisfactory to the country at large. *** I am fully convinced that the country possesses at the present moment a legislature which answers all the good purposes of legislation; and this to a greater degree than any legislature ever has answered in any country whatever. * * * Under these circumstances I am not only not prepared to bring forward any measure of this nature, but I will at once declare, that, as far as I am concerned, as long as I hold any station in the government of the country, I shall always feel it my duty to resist such measures when proposed by others."

The tone assumed by the opposition in both houses after this haughty declaration convinced ministers of their rashness in venturing to meet such a parliament in an official capacity. Their embarrassment was increased in consequence of an injudicious manœuvre, intended to terrify the more timid of their opponents, by impressing them with an exaggerated notion of popular violence. The king and queen were to dine at Guildhall on the Lord Mayor's day; but, under the pretext that there was a conspiracy on the part of some abandoned characters to attack the Duke of Wellington, their majesties were induced to

William loyalty of the nation, and adroitly confounding the king with his advisers, to give greater firmness to a wavering government, failed signally. The ministers became ridiculous. The invectives of the opposition in parliament became more pointed and inveterate; and on the 15th of November Sir Henry Parnell moved "that a select committee be appointed to take into consideration the estimates and accounts presented by command of his majesty respecting the civil list." After a short debate ministers were left in a minority of twenty-nine in an unusually full house. Mr Hobhouse asked Sir Robert Peel whether it was the intention of ministers to retain their places after such an expression of the sentiments of the house, but received no answer. Next day the Duke of Wellington in the Peers, and Sir Robert Peel in the Commons, announced, that in consequence of the vote of the preceding evening, they had tendered, and his majesty had accepted, their resignations.

The king immediately authorized Earl Grey to form an administration upon the basis of making parliamentary reform a cabinet question. His lordship had refused his support to the Canning administration on the ground that its premier was opposed to reform. His son-in-law Lord Durham, Lord Althorp, the Marquis of Lansdown, and Lord John Russell, were tried adherents of the Whig party, and friendly to reform. These, with Lord Holland, may be regarded as the nucleus of the reform administration. Its ranks were filled up by Mr Canning's friends, who had gathered from the signs of the times the impossibility of longer withstanding those innovations which timidity of character or the prejudices of education had led them to oppose. The treatment which their leader had experienced at the hands of the high aristocratic party rendered them less averse to any measure that promised to sap its power. The Duke of Richmond was the only leading member of the old Tory party who accepted office under Earl Grey. Others of that party had joined, after the concession of the Catholic claims, in calling for reform; but their object was merely to raise a clamour against a political adversary, and they ceased the moment they saw Brougham was appointed lord high chancellor.

There was necessarily a suspension of business in parliament till the ministers who had vacated their seats by accepting office should be re-elected. By the time that they were all restored to their places, it was too late to think of maturing and developing their system of policy before the Christmas holidays. Accordingly, Earl Grey contented himself with declaring, that it was the intention of the cabinet to introduce a plan for the reform of the Commons House of Parliament. The regency bill was passed in conformity with the recommendation in the speech from the throne. And on the 23d of December 1830 both houses adjourned to the 3d of February; ministers having declared that a long interval was necessary to enable them to concoct that plan of reform to which they had pledged themselves on accepting office.

The interval of parliamentary exertion was an uneasy one for the country. The riots and outrages in the agricultural districts had begun to decline; but the duty of punishing the convicted transgressors of the law remained to be fulfilled. During the latter half of December and the beginning of January, upwards of eight hundred rioters were tried before special commissions. Of those against whom sentence of death was recorded, only four were executed; the rest were ultimately sentenced to various terms of transportation and imprisonment. Com-

William IV.

1831.

Neither had the change of administration been entirely successful in restoring public confidence in the constituted authorities. The stern unbending adherence of Earl Grey and his immediate friends to the cause of reform was in their favour; but the country was determined to trust no man, and meetings were held in every county and town to petition for such an alteration of the elective system as might have a tendency to secure good government.

Parliament met, as appointed, on the 3d of February 1831. Ministers announced that their plan of parliamentary reform should be brought forward by Lord John Russell on the 1st of March. The interim was occupied by discussions on the arrangement of the civil list prepared by ministers, on the budget, and on a plan for reforming abuses in the court of chancery, proposed by the lord chancellor. On that evening accordingly his lordship explained the nature and extent of the ministerial plan-The general outline bore a marked resemblance to that of the measure brought forward on a former occasion by Mr Lambton, and thrown out by a manœuvre on the part of Mr Canning. The chief grievances complained of by the people, it was remarked by Lord John, were the nomination of members by individuals, and elections by close corporations, the limited extent of the elective franchise, and the expense of elections. With a view to do away with the two first-mentioned evils, in as far as regarded England, ministers proposed to introduce a bill proceeding upon the three principles of disfranchisement, enfranchisement, and extension of the right of suffrage. In order to reduce expense, they intended to recommend an alteration in the system of registering voters and of taking the votes at elections. The extent of disfranchisement deemed necessary to extirpate close and nomination boroughs went to deprive such places as had a population of fewer than two thousand inhabitants of their right to send any members to parliament, and to restrict such as had a population of only four thousand to one member each. Weymouth, which had previously returned four members, was to lose two of them. By this measure sixty burghs would be there was danger of their request being granted. Mr totally disfranchised, and forty-seven partially, exclusive of Weymouth. The number of members thus withdrawn would amount to 168. Ministers did not propose to fill up the former number of the House. Seven large towns, which had previously been wholly unrepresented, were to receive two members each. Twenty other towns, smaller in size, and of less importance, were to receive one member each. The metropolis was to be subdivided into four additional districts, which were to return among them eight members. An addition of two members was to be given to each of the twenty-seven largest counties, and each riding of the county of York was to return two additional members, and the Isle of Wight one. The distribution of the elective franchise through the country having been thus arranged, the next point to be settled was the persons to whom the right of voting should extend. The object of ministers was not to communicate the franchise to every subject, but at the same time to extend it so far that every man who persevered in habits of honest industry might fairly calculate upon being able to attain it. Non-resident voters, as productive of much expense and bribery, were deprived of their privilege. Every householder rated at ten pounds per annum, whether the house he inhabited were his own or rented, received the right of voting. In counties, the possession of copyhold property rated to the amount of ten pounds per annum, or a lease for twenty-one years parative tranquillity was restored; but the mischief that of the yearly value of fifty pounds, likewise entitled to a had been done was not amended, nor was a healthy confi- vote. The last object contemplated by the ministerial

in towns, and a person appointed by the judge of assize in counties, was to hold a court for the purpose of hearing in towns, and three in counties. The counties were to be divided into polling districts, so arranged that no voter should have to go more than fifteen miles in order to exercise his franchise. This ample measure of reform for former country, it was to receive five additional members. Twenty-two counties were to return one member each. The remaining twelve were to be conjoined into pairs, returning one each. Edinburgh and Glasgow were each to return two members; while Aberdeen, Paisley, Dundee, Greenock, and Leith, were each to return one member. The remaining thirteen districts of royal burghs were to return each one member, as before, but the elective francils to the inhabitants possessed of a certain qualification. The qualification required in burghs was the occupancy of a dwelling-house of ten pounds per annum; in counyear, or holding as a tenant at the annual value of fifty reform of the Irish system was much less extensive, behad been entirely re-modelled little more than thirty years before, at the time of the union. It was proposed that occupancy to the amount of ten pounds per annum should give the right of voting for burghs, and that Belfast, Waterford, and Limerick should each return an additional member. It was calculated that by this great measure 500,000 persons would be added to the national constituency, all having a stake in the country, and so dispersed over its extent as to place them beyond the influence of any faction.

This bold measure produced an electrical effect upon parliament. The sincere reformers hailed its searching character as indicative of the honesty of its authors, and fruitful of good to the nation. The timid wavering reformers stood aghast, and so did all the champions of old abuses. Mr he felt himself bound to admit that they had completely redeemed the pledge which they had given. Mr Macaulay, speaking the sentiments of the young and highly educated liberals, thought it "a great, noble, and comprehensive plan." Lord Ebrington, the model of a sturdy, sagacious, independent country gentleman, "hailed the measure, as it gave due weight to every interest, and was calculated to stem the torrent of corruption." Sir R. Inglis, as legal formalists, denounced the measure as "a corporation robbery." The debate on Lord John Russell's mominated on the 9th of March without a division. Leave courts were with horse, while the guns boomed, and mar-

Reign of plan of reform was the diminution of election expenses. was on the same evening given, after a short discussion, Reign of William With a view to prevent the disgraceful tricks frequently to bring in bills to amend the representation of the people William practised on the hustings, the most fertile source of ex- in Scotland and Ireland. The English bill was introduced pense, a list of all qualified persons in every parish was by Lord John Russell on the 14th of March, and read a ordered to be prepared by the parish officers and church first time; the same step was taken with the Scotch bill wardens. This list was to be placed on the church door, by the Lord Advocate on the 15th, and with the Irish and at a certain period of the year the returning officer bill by Mr Stanley on the 24th. The discussion on the second reading of the English bill was characterized by a yet more fierce and inveterate spirit of hostility to all and deciding upon the claims of persons whose votes had reform, than that which took place when the measure was been held objectionable. The list, as finally adjusted, first propounded. After a debate which lasted for two was to be published, so that every person might obtain a evenings, the motion that the bill be read a second time copy, and was to serve as the election roll for the ensuing was carried by a majority of one. The opposition, thereyear. The duration of the poll was limited to two days fore, went into committee with a fair prospect of being able to mutilate, and finally defeat the bill. Their first demonstration was a declaration, moved by General Gascoyne, "that it is the opinion of the house that the total number of members returned to parliament for England England it was proposed to follow up by similar measures and Wales ought not to be diminished." The General's applicable to Scotland and Ireland. With regard to the motion was carried by a majority of eight; a result which intimated to ministers that they had not such a hold upon the house as afforded them the most distant chance of carrying the measure by which they stood pledged to stand or fall. In order to appreciate the propriety of the line of conduct adopted by them on this occasion, it will be necessary to look to the effect which the promulgation of the ministerial plan had produced upon the national mind.

The boldness of the measure, so much beyond what chise was transferred from the delegates of the town counhad been expected, had greatly conciliated the radical party, of which the unions might be considered as the representatives. Even the vital questions of the shortened duration of parliaments, and a secret mode of taking the ties, the ownership of land or houses worth ten pounds a votes, were postponed by one consent, lest any difference of opinion should endanger the success of so efficient a pounds on lease for nineteen years or upwards. The measure. The popular sense accepted the bills as satisfactory, and the nation crowded to their defence. Riot and cause, as was alleged, the representation of that country destruction ceased; for every man was intent upon the prospect held out of good government and better days. The tables of both houses were loaded with petitions in favour of the bill. The more apparent it became that the Commons would not pass it, the more intense became the affection manifested by the people for its provisions. It was evident that they regarded it as the standard to which they were to look as a rallying point amid the whirls and eddies of the headlong fight in which they were engaged. With the people in such a mood, and the king remaining true to his promises, the ministers were quite safe in throwing themselves upon the sense of the electors by a dissolution of parliament.

But the intimation that such a step was in contemplation was received with anger and alarm by the opponents of re-Hume, a fair representative of the radical party, said the form. They were not prepared for so determined a meaplan of ministers had so far exceeded his expectations, that sure; and notwithstanding their declarations that the bill was contrary to the national wish, they knew that the people were against them. The exhibition of petty anger which took place in both houses, but particularly in the Lords, on the day of dissolution, baffles all description. An eye-witness speaks thus: "A hope had remained that the project of stopping the king's speech, and interposing an address, might succeed. That hope rested entirely upon the speech being read by the chancellor or by his majesty the organ of the high-church party, declared that the in person. Suddenly the thunder of the guns was heard to " plan of the noble lord meant revolution, not reforma- roar, breaking the silence of the anxious crowds without, Sir Charles Wetherell, as representative of the and drowning even the noise that filled the walls of parliament. Having stopped in the robing chamber in order to put on his crown, he entered the house and ascended the throne, while his officers and mi-As soon as he was seated, nisters crowded around him. he ordered the usher of the black rod to summon the Commons; and his majesty, after passing some bills, addressed them. By those who were present the effect will not soon be forgotten, of the first words he pronounced, or the firmness with which they were uttered, when he said, that 'he had come to meet his parliament in order to prorogue it with a view to its dissolution!' He then with an audible voice commanded the lord chancellor to prorogue, which being done, the houses dispersed, and the royal procession returned amidst the hearty and enthusiastic shouts of thousands of the people."1

In the state of the national mind, the result of the elections could not be doubted. "The bill, the whole bill, and nothing but the bill," became the general cry of the reforming electors; and to this the candidates were called to pledge themselves at every open election. The Duke of Newcastle, who had formerly returned two members for Newark, and two for the county of Notts at large, found his interest reduced to four rotten borough seats, where no man could interfere with him. The Duke of Beaufort's brother, and his eldest son, both justly popular noblemen, were flung out, solely because they were opposed to reform. The Duke of Rutland's nominees were rejected in his own county. In Northumberland the minister's son, who had not ventured to enter the field at the preceding election, was returned, notwithstanding the indolence of his friends. In short, out of eighty-two county members, England returned seventy-six pledged to support the bill; the members for the cities and great towns were for it to a man. Ireland returned a great majority, and even Scotland a majority of friends to reform.

The success of the ministerial measure in a House of Commons so constituted was beyond a doubt. Its enemies, however, exerted every device to delay and baffle the English reform bill. By trifling motions pushed repeatedly to division, the opposition succeeded in retaining the English bill in the House of Commons from the 15th of June till the 22d of September, when it was finally agreed to

by a majority of one hundred and nine.

The eyes of the people followed it with anxiety to the House of Lords. It struck at the roots of an influence which that body possessed over the house which ought to have been the representative of the people; and this influence, it was known, a majority of their number were resolved to preserve. When submitted to them, the bill was brought before a tribunal of prejudiced and interested judges. Its fate, if left to the House of Lords as then constituted, was sealed before the debate had begun. The nation knew this, and loudly and urgently was the necessity of a new creation of peers pressed upon ministers, but in vain. Earl Grey had determined to give his noble colleagues an opportunity of dealing justly by the nation.

The debate on the second reading commenced on the 3d of October, and continued during that and four succeeding evenings. The arguments brought forward against the bill were various and contradictory. After this long and fatiguing debate, the Peers of England, by a majority of forty-one, decided, in opposition to a majority nearly triple that amount of the House of Commons, and to the almost unanimous voice of the nation, that a system of cunningly veiled oppression and corruption should be perpetuated.

The indignation of the country was great, although Reign of happily prevented from breaking out into open violence by the firmness of ministers and the House of Commons. The chancellor of the exchequer declared in the House of Commons on the 10th of October, the earliest day on which that house assembled after the rejection of the bill by the Lords, "that unless he entertained a hope that a measure of reform equally efficient with that which had been rejected would be carried hereafter, he would not remain in office a single hour longer." Lord Ebrington brought forward the same evening a motion for a vote of confidence in ministers, which was carried by a majority of a hundred and thirty-one in a house of five hundred and twenty-seven; and the house by this means pledged to support ministers and the reform bill. On the 20th,

parliament was prorogued by the king in person.

Owing to the firmness of the king, his ministers, and the House of Commons, the decision of the Lords was received by the people with deep-felt disgust; but, except in two or three isolated cases, without any alarming bursts of violence. At Derby the rabble broke open the town jail, and demolished the property of some anti-reformers, and were only prevented from the perpetration of further violence by the interference of the military. The castle at Nottingham, the property of the Duke of Newcastle, was burned by a band of rioters. Some rioting, but not of a very serious character, took place in Somersetshire and Devonshire. And at Bristol, the arrival of Sir Charles Wetherell, a strenuous anti-reformer, to discharge his judicial duties, excited a popular ferment, which, being met on the part of the magistrates at first with precipitate violence, and afterwards by cowardly supineness, hurried the populace on to works of extensive destruction. In every other part of the kingdom, however, large meetings were held, and perfect obedience to the law enforced.

Parliament re-assembled on the 6th of December 1831. In the speech from the throne, a speedy and satisfactory settlement of the question of reform was urgently recommended. The ministry adhered to their original purpose of remodelling the representation by three separate bills applicable to the varying social relations of the three incorporated nations. That which had for its object the reform of the English representation was introduced on the 12th of December. It was confessedly superior to the former in precision of expression; and some of the subordinate arrangements had been modified with a view to avoid the captious quibbling of the preceding session. The opposition modestly claimed all the improvements as their own, and yet attacked the measure as inveterately as ever. The ministerial members adopted the prudent resolution of leaving all the speaking to their opponents; but, nevertheless, the pertinacious volubility of these orators was so far successful in retarding the bill, that it did not pass through the House of Commons before the 22d of March.

It was carried up to the Lords with even more gloomy anticipations than on the former occasion. No new peers had been created. Lords Harrowby and Wharncliffe, who had seemed at one time inclined to come to terms, resumed a hostile attitude. Between the first and second reading of the bill, however, these noblemen and their followers determined to make a concession to public feeling, and allow the bill to go into committee. In consequence of their wavering, the second reading of the bill was carried by a majority of nine, and the bill ordered to be committed the first day on which the house should

Reign of sit after the Easter recess. The house, immediately after lated. The discussions of the measure in the House of William coming to this resolution, adjourned for the holidays. Lords, subsequent to this communication, were mere mat-During the interval, the whole country was kept in a ferment by meetings assembled for the purpose of expressing their satisfaction that the bill had passed the second reading, and earnestly adjuring the Lords to give it the sancof the full measure introduced by Earl Grey.

While the people were thus openly busy, their enemies were privately at work with equal assiduity, and not without some success. Earl Grey, unsuspicious of the mine about to be sprung under his feet, moved, on the 7th of May, in a committee of the whole house, the adoption of the clause disfranchising all burghs having a population beneath two thousand. Lord Lyndhurst moved, as an amendment, the postponement of the first and second clauses until the question of enfranchisement should have been taken into consideration. The object of this manœuvre was to leave the opposition an opportunity of conciliating the unrepresented great towns before it proceeded to mutilate the bill. A suspicion to this effect was raised by the care which some noble lords took to vindicate the fairness of their intentions before any body had called them in question; and suspicion was rendered certainty when Lord Ellenborough favoured the house with an outline of the plan of reform which he and his friends had in contemplation. Ministers were left in a minority of thirty-five. immediately postponed the discussion, and next day recommended to the king, in prosecution of a former understanding, a creation of peers sufficient to insure the passing of the bill. His majesty refused, and ministers immediately resigned.

Lord Althorp no sooner announced the ministerial resignation in the House of Commons, than Lord Ebrington gave notice of a motion to address the king on the state of affairs next evening. The address which, in pursuance of this notice, his lordship moved, expressed the most entire confidence in the late ministry, warned the king of the unabated ardour of the nation in favour of reform, and prayed that no men might be called to his mathe reform bill, unimpaired in all its essential provisions. The debate which ensued was eminently characterized by boldness and determination on the part of the reformers. The address was agreed to by a majority of eighty, in a house of four hundred and ninety-six. The House of Commons was supported by the nation. Wherever the news arrived of the resignation of Earl Grey, and it was circulated with unexampled rapidity, the inhabitants rose in mass, and feeling confidence of their representatives, petitioned them to stop the supplies; while it was announced in many places, that in the event of the House of Commons refusing to do its duty, no more taxes would be paid until the reform bill passed into a law. Not one act of rioting was perpetrated from one end of the kingdom to the other, but the orderly conduct of the assembled multitudes only made their anger the more terrible.

The Duke of Wellington undertook to form an administration which should take office upon condition of carrying through a large measure of reform. At the first hint of this project, the national indignation blazed up more fiercely; the timid class of politicians shrunk from the side of their leader; and the duke having abandoned the task as hopeless, the king was obliged to recal Lord Grey.

On the evening of Friday the 18th May, Lord Althorp announced to the House of Commons that ministers had again accepted office, after receiving assurance that every power would be placed in their hands which should be found necessary to secure the passing of the reform bill unmuti-

ters of form. Few of the amendments proposed were ever pushed to a division. Even the most obnoxious clause of all, that which gave members to the metropolitan districts, reading, and earnestly adjuring the Lords to give it the sanc- was carried by a majority of fifty-five, in a house of a hun-tion of a law. These assemblages were more frequent, dred and twenty-seven. A creation of peers was not reand attended by greater multitudes, than had ever previ- sorted to for the purpose of carrying the bill. In order to ously been witnessed; and at all of them it was unequivo- render that supposed evil unnecessary, a sufficient number cally declared that nothing would satisfy the nation short of noble lords absented themselves from the house to leave ministers in a majority on the third reading. The few who remained, however, expressed in their speeches the concentrated resentment of all the absentees. The royal assent was given to the English bill by commission on the 7th of June 1832.

The bills for Scotland and Ireland had been merely read a first time, and then allowed to lie over until the key-stone of the arch, the English bill, had been secured. As soon as that object was attained, the discussions upon the other two were resumed. Those regarding the Scotch bill were little more than a mere matter of form, no serious opposition being offered. It received the royal assent by commission on the 17th of July. Greater difficulty threatened to arise on the question of the Irish bill, tor a strong body of the Irish members were dissatisfied with the provisions for the extension of the franchise, regarding them as insufficient. But timely concession on the part of ministers conciliated the malcontents; the bill passed the House of Commons on Friday the 20th of July; no essential alterations were made by the House of Lords; and the new constitution of the imperial parliament was thus, after an arduous struggle, completely established.

On the meeting of the first reformed parliament in January 1833, a trial of strength between the parties in the house, and a test of the efficiency of the bill, was eagerly expected by the public. An opportunity seemed to be afforded by the election of a new speaker for the House of Commons, Mr Manners Sutton having expressed his purpose to resign; and on this occasion Mr Hume and his party, who were anxious that the reformed parliament should have an adherent of reform for its speaker, proposed Mr Littleton as his successor. Happily, however, the contest was avoided by the re-election of Mr Sutton, ministers being apprehenjesty's councils who were not prepared to carry into effect sive of a too sudden influx of ardent inexperienced members into the house; and the motion of Mr Hume, although supported by Mr O'Connell, having only 31 votes in its favour against 241, showed that the spirit of reform was for the present satisfied with what it had already secured. The chief struggle, however, succeeded in the settlement of Irish affairs, this subject having been earnestly recommended to parliament in the opening speech of His Majesty. In reference to these, he had expressed his confidence that they would entrust him with such additional powers as might be found necessary for controlling and punishing the disturbers of the public peace in Ireland, and for preserving and strengthening the legislative union between the two countries, which, he added, "I am determined to maintain by all the measures in my power, as indissolubly connected with the peace, security, and welfare of my people." fierce attack followed from Mr O'Connell, who characterized the speech as a "bloody, brutal, unconstitutional address," and ended by moving, that the house should resolve itself into a committee for its consideration. A keen debate ensued, which was carried through four adjournments, when Mr O'Connell's proposal was rejected by 428 against 40, of which minority, 35 were Irish members. The coercion bill for the suppression of disturbances in Ireland was then introduced by Earl Grey into the House of Lords, and carried through without opposition. But no such tranquil reception awaited it in the lower house, where a stormy debate of six days ensued before the first reading of the bill was carried by 466 votes against 89, this majority having been obtained

Reign of by the conservative party supporting the ministers. Undismayed by such a union, the Irish members and their adherents continued to oppose the bill at every step of debate, until it was passed with some alterations through a third reading by a majority of 345 to 86. The prospect, however, of coercive pacification was so discouraging that Mr Stanley resigned his office of secretary for Ireland, and was suc-

ceeded by Sir John Cam Hobhouse.

As a palliation to the severity of the coercive bill, it was resolved to gratify the bulk of the Irish community at the expense of the Established Protestant Church. Accordingly, it was proposed that its revenues, amounting to L.800,000 per annum, should be taxed from 5 to 15 per cent., with the exception of livings under L.200, and the first fruits abolished; that ten bishoprics should be annulled, and the revenues of the primate and the bishop of Derry diminished; and that out of the fund accruing from these and such reductions, estimated at L.300,000, the levying of church cess was to be discontinued, poor livings augmented, and the religious education of the people more widely and effectually promoted. This bill, which alarmed the Protestant, without satisfying the Romish party, encountered much opposition out of doors, although it passed through its third reading in the Commons on the 6th of July by a large majority. In the House of Lords it only passed after much debate and with several modifications. Another measure for the pacification of Ireland originated in the collection of tithes, a process that was everywhere the source of resistance, riot, and bloodshed. It was now proposed that a sum not exceeding L.1,000,000 should be issued in exchequer bills for the purpose of advancing "under certain conditions the arrears of tithes due for 1831 and 1832, subject to a deduction of 25 per cent.; and the value of the tithes for 1833, subject to a deduction of 15 per cent., to such persons as may be entitled to such arrears or such tithes, and as may be desirous of receiving such advances; and that the amount advanced shall be included in the tithe composition, so as to be repaid in the course of five years, being payable by half-yearly instalments." This resolution was likewise carried, although it was alleged that such a pretended loan would ultimately be converted into a gift, and that England besides paying her own tithes would be obliged to pay those of Ireland also.

Another important parliamentary measure of this year successfully closed the long struggle for negro emancipation. On this occasion an act was passed, that on the 1st of August 1834 slavery should wholly cease throughout all the British colonies, while the immense sum of twenty millions sterling was voted to the West India planters as a compensation for their loss through the abolition of compulsory labour. Never, indeed, had the cause of humanity received a sacrifice so great, so national, and so disinterested. To avoid the danger of the reaction that might result from such a sudden change, it was also provided that every emancipated negro, instead of being thrown loose upon society, should become an apprentice to his late master for a term not exceeding six years, and work for him forty-five hours in the week.

On the following year the attention of parliament was chiefly occupied, as before, with the affairs of Ireland. The late concessions to that country had been received by O'Connell and his party merely as the first instalments of a debt, and Catholic emancipation itself as a prelude to the repeal of the union; and thus there was no end to their demands, or limits to their discontent. This was now shown upon the question of Irish tithes, connected with the renewal of the coercion bill, in which the difficulties became so complicated, that Earl Grey resigned, and was succeeded in office by Lord Melbourne. The new premier then brought forward his plan for the adjustment of the tithe question, which he stated to be the ultimatum, beyond which nothing was to be granted or expected. It was, that the tithes were to be collected by the crown and paid by the landlord, and

thus the odium, as well as riots, occasioned by the former Reign of mode of levying them, would be avoided. But as the revenues of the clergy, in consequence of this change, were to undergo a diminution of  $22\frac{1}{3}$  per cent., to defray the expenses of collecting them, the bill was rejected at the second reading, and the clergy of the Irish Established Church consigned to their former poverty and uncertainty. This hasty escape from one difficulty, only plunged the ministry into another. On seeing the Irish Church thus left to its fate. the English Dissenters who had supported the reform bill through all its stages, imagined that their season for remonstrance and redress had fully arrived; and a shower of petitions followed, demanding exemption from the payment of church rates, and, in some cases, for the entire abolition of all connection between church and state, or at least, for the general adoption of the voluntary system, by which every person should not only choose his own church, but support his own minister. These petitions, however, only provoked a storm of counter-petitions, in which parliament was entreated with equal urgency to preserve the rights of the Established Church inviolate. But the chief grievance of which the Dissenters complained, was their virtual exclusion from literary degrees at the universities of Cambridge and Oxford, by the demand of conformity to the Church of England, and subscription to its articles; and they therefore prayed that these halls of learning should be thrown open to all, and their honours made accessible to every competitor. This petition was signed by sixty-three resident members of the senate of Cambridge, and introduced to both houses; but although its demand was limited to the abolition of university tests, it was regarded as a prelude to the overthrow of church establishment itself, and as such, was rejected in the Lords by a majority of 187 against 85 votes, and in the Commons of 321 against 174.

The only other important measure of this season was the bill for altering and amending the poor laws, upon which a commission of inquiry had been instituted soon after the accession of the new ministry to office. The bill was introduced by Lord Althorp on the 17th of April, and its chief proposal was, that instead of magistrates being invested with power to relieve the poor in their own dwellings, or on the roadside, the right in bestowing relief should be intrusted to the entire management of a board of commissioners named and appointed by ministers. Long and keen discussions followed, and several alterations and amendments were made upon the bill, until the Act 4th and 5th of Wil-

liam IV. was passed in the month of August.

The whig ministry that had satisfied neither the Irish agitators nor English radicals, and had generally become unpopular, was now superseded by a new administration, in which Sir Robert Peel succeeded Lord Melbourne as premier. The events that followed this change were neither numerous nor important. At the first meeting of the new parliament, which was convoked for assembling on the 19th of February 1835, Mr Abercromby was chosen speaker of the House of Commons, instead of Sir Charles Manners Sutton, and parliament was opened by the king in person on the 24th. The principal question at issue when the business commenced, was the vexatious one of Irish tithes, and an inquiry into the nature, extent, and tendency of orange lodges. But a still more momentous subject of discussion was embodied in a motion of Lord John Russell, "That the house should resolve itself into a committee of the whole house, to consider respecting the temporalities of the Church of Ireland." Another motion of his lordship consequent upon this was, "That any surplus which may remain, after fully providing for the spiritual instruction of the members of the Established Church in Ireland, ought to be applied to the general instruction of all classes of Christians." A third motion of his Lordship on the 7th of April, after several adjourned debates upon the subject was, "That it is the opinion of the house, that

Victoria.

1837.

Reign of no measure on the subject of tithes in Ireland can lead to a satisfactory and final adjustment, which does not embody the principle contained in the foregoing resolution." motion was carried by a majority of 285 against 258. Sir Robert Peel on finding the current thus strongly set against him, resigned his brief two months' tenure of office, and an administration succeeded, having Lord Melbourne at its head, as first lord of the treasury. This change, however, was followed by no important consequences, for the bill which the new ministers introduced for the regulation of the Irish Church, after passing through the House of Commons, was rejected by the Lords.

In the ensuing year several important measures were proposed and carried successfully through both houses. The first was a cabinet plan for the commutation of tithes in England, by which provision was made for the extinction within two years of the right of exacting them in kind, by the payment of a money rate, according to the value of corn ascertained by a seven years' average. Another was the general registration of births, marriages, and deaths. A third concerned the marriage laws, by which Dissenters were allowed to celebrate the rite of marriage in their own places of worship, or wherever they thought fit, instead of submitting to the usages of the Church of England. It was also intended during this session to bring in four bills, having for their object certain reforms in the English Church; but on account of the hostility of the radical party, and the lateness of the season, only one was passed, under the name of the Established Church bill, by which certain bishoprics were united, two new ones erected, and a reduction effected upon their revenues to the amount of L.28,500 per annum.

Such were the principal occurrences of this reign after the passing of the Reform bill, an event that constitutes its chief point of interest. It was now closed by the demise of William IV., who died at Windsor Castle on the 20th of June 1837, in the seventy-second year of his age, and when he had he all but completed the seventh year of his reign.

## CHAPTER XXII.

Succession of Victoria to the Throne.—Revolts in Lower and Upper Canada.—Measures for their suppression.—Earl of Durham's unsuccessful government of the Canadas.-Discontents in Jamaica. -The Bed-Chamber controversy.—Chartist insurrection.—Marriage of the Queen with Prince Albert.—Afghan war.—Unfortunate retreat of the British from Cabul.—Successful termination of the war in Afghanistan.-War in Syria and bombardment of Acre.—War in China, and submission of the Chinese.—War in Sinde.—Disruption of the Church of Scotland.—War with the Sikhs, and its successful results.—Abolition of the Corn Laws.— Compromise in the Sugar Duties.—The Potato Blight.—Remedies for the Famine in Ireland.—Death of O'Connell.—Relief given to the West Indian Colonies .- Irish Rebellion .- Encumbered Estates bill.-War with the Sikhs.-Movements of the Protectionist party in behalf of Agriculture.—Right of Self-government granted to our Colonies.—Papal Aggression.—Ecclesiastical Titles' bill.—Death of the Duke of Wellington.

On the accession of Queen Victoria to the throne of Great Britain, every thing gave promise of a prosperous and happy reign. The country was tranquil; and people of all classes, mindful of the prosperity in arts and arms, that had crowned the eras of Anne and Elizabeth, were ready to welcome once more the rule of a female sovereign. The little kingdom of Hanover also, which for more than a century had been a source of vexation to Britain, was at last severed from the empire, in consequence of the Salic law which prevents the succession of a female to the Hanoverian crown. The moderation of the young queen's first step in government justified the hopes of her people, for instead of yielding to the temptations of innovation and change, she retained the officers of state in their places, and honoured them with her confidence. In consequence of this disinterested commencement, the elections of members for the

new parliament went onward as tranquilly as if no change in the occupation of the throne had been experienced.

1837.

Reign of Queen Victoria.

But while harmony thus prevailed throughout the United Kingdom, the case was very different in our colonial province of Lower Canada, where the French part of the popu lation had long been in a state of insubordination; and as, out of forty members who composed the Legislative Council, eighteen were French Canadians, there was fuel enough to inflame the general discontent. The grievances chiefly complained of, as exhibited in a memorial sent to the British parliament in 1828, and signed by 87,000 inhabitants of Lower Canada, were—arbitrary conduct on the part of the governors-the appointment of none but creatures of the executive government to the legislative council—the illegal appropriation of public money-violent prorogations and dissolutions of the provincial parliament—connivance of the government at the insolvency of Sir John Caldwell the receiver-general—and certain acts of the imperial parliament relative to Canadian trade and tenures. Since the publication of that report, the attention of parliament had been repeatedly occupied with its details, and in most cases a strong disposition had been evinced to meet them with concession. These concessions, however, liberal though they were, did. not satisfy the colonists, who only became the more extortionate in their demands, so that at last they announced their purpose to withold any rate of supply, until the alterations in the constitution which they demanded were fully satisfied. Thus matters went on until 1837, when the discontent broke out into open revolt, headed by Mr Papineau, their chief agitator, who, however, fled at the commencement of action, and left his followers to shift for themselves. This they did by a gallant resistance in several encounters with the royalist forces, until they were finally defeated and dispersed by Sir John Colbourne, the British commander-in-chief. This example of rebellion in Lower Canada was not lost upon the Upper province, whose malcontents had been tampered with by emissaries from the United States; and towards the close of the year, an association calling itself the Provincial Convention, issued a manifesto inviting their follow-colonists to arms, in language as wild as that of the fifth-monarchy saints of the days of Cromwell. It invited them to buckle on their armour, and establish a government and perpetual peace "founded upon the eternal heaven-born principles of the Lord Jesus Christ," and no longer to be "hood-winked by Baal's ministers, and tampered with by wolves in sheep's clothing, who take the wages of sin, and do the works of iniquity." For this outburst, Sir Francis Head, the governor of Upper Canada, was utterly unprepared; strangely enough, even when the insurrection was expected, and on the eve of explosion, he had cleared the province of all the regular troops, and left nothing for its defence but six thousand stand of arms under the peaceful custody of the mayor of Toronto. He was suddenly roused from his security, and even from his bed, at ten o'clock at night, by the advance of the insurgents, estimated at three thousand strong, but in reality not more than five hundred, who entered Toronto under the command of Mr M'Kenzie, editor of a republican newspaper, M. Van Egmont, an ex-officer of Napoleon, Mr Gibson, a land-surveyer, and Mr Lount, a blacksmith. Roused into decisive action by this sudden emergency, the governor extemporized a militia force that was soon sufficient to keep this motley rebellion at bay, until the arrival of reinforcements of loyal volunteers to the amount of ten or twelve thousand, obliged the insurgents to betake themselves to flight.

These increasing difficulties in the government of Canada, that seemed only to have awaited the commencement of a female reign to break out into actual rebellion, perplexed the ministry at home. In spite of all their conciliatory measures, the colonial discontent had swelled into open insurrection, and although this had been promptly suppressed, a second attempt might soon follow more perfectly matured

Reign of than the first, and more formidable in its consequences. There were many also at home, and of these, some were in parliament, who asserted that Canada was now ripe for selfgovernment, and should therefore be released from its dependence on the mother country; and that the example of the United States should warn us of the danger of a refusal. These consideration occupied the attention of parliament in 1838; and after several debates, the Canada bill of Lord John Russell was moved, and passed through both houses. Although sufficiently stringent in its character, it was reckoned not more so than the crisis required; and, notwithstanding a fierce resistance from the Canadian sympathizers, it was carried, after undergoing several amendments, by large majorities. The principal provisions of this bill were in substance the following:—"The constitution of Lower Canada was suspended till November 1840. Her Majesty in council was empowered to constitute a special council, and to appoint or authorize the governor to appoint such and so many special councillors as she might think proper. It was declared that, until November 1840, it should be lawful for the governor, with the consent and advice of the majority of the said councillors convened for the purpose, to make such laws or ordinances for the peace, welfare, and good government of Lower Canada, as the legislature of that province, at the time of passing the act, was empowered to make; and that all laws or ordinances so made, subject to the provisions thereafter contained for disallowance thereof by Her Majesty, should have the like force and effect as laws passed before the passing of the act by the legislative bodies. The governor was to have the initiative of all measures proposed to the council, five of whom were required for a quorum." The governor, under whom this new experiment of colonial government over nearly a million and a half of discontented subjects was to be attempted, was also nominated; this was the Earl of Durham, son-in-law of Earl Grey, whom Lord John Russell characterized as possessed of large political experience, combined with such liberality of sentiment as would best secure the confidence of the Canadians. Lord Durham accepted the charge with reluctance, and proceeded to his seat of government; but there his rule was both brief and unhappy. Trying at once to punish and conciliate, he only exposed himself to the hostility of the Canadians, and the reproaches of the home government; and, at last disgusted with his charge, he suddenly resigned it after six months of occupation, and returned to England, loudly complaining that the ministry at home had not supported him as they ought to have done. His arrival under such circumstances was so unprecedented and ungracious, that on landing, the usual salute of guns to him as a representative of royalty was withheld, and he was even threatened with impeachment. Indeed, almost simultaneously with his landing, tidings arrived from Lower Canada that the rebels were again in arms, and in greater force than ever. The debates that followed upon Canadian affairs bore so hard upon the earl, that to justify himself to the country at large, he published his report upon the condition of the colony, which he had originally drawn up for the enlightenment of the ministry. In the Queen's speech at the opening of parliament for 1839, the rebellion of Lower Canada, and the intrigues of the inhabitants of the United States to promote a similar spirit in the Upper province, had been pressed upon the attention of both houses; and in the debates that followed, the Duke of Wellington urgently insisted upon the disturbed state of our North American possessions, as well as the precarious tenure by which we held them. He declared that it was nothing less than a great national war, which could only be successfully terminated by an extensive scale of action; and he expressed his regret that not only American citizens should have entered these territories with American arms and cannon, but also that their government should have no power to prevent such interference.

Victoria,

1838.

The affairs of Canada, which occupied the attention of Reign of parliament during this year, were alternated with petitions for the abrogation of the corn-laws, and premature attempts to make this great question the subject of parliamentary discussion-with the condition of Afghanistan, into which an Anglo-Indian army had been marched-with proposals for further parliamentary reform—and the appointment of a committee of inquiry into the state of Ireland, occasioned by the assassination of the Earl of Norbury. But of still more urgent consequence was the condition of Jamaica, where the planters were so discontented with the changes introduced into their government, consequent on the abolition of negro slavery, as to cause apprehension of serious commotions. In consequence of this, a bill was introduced into parliament, proposing to suspend the existing constitution of the colony for five years—a daring remedy, which was met by the most decided opposition on the part of Sir Robert Peel. The bill, which was a ministerial one, was gained by only a majority of five, 289 being against it, and 294 in its favour; and in consequence of this significant indication, the Melbourne cabinet, whose popularity had been gradually decreasing, sent in their resignation. On the Duke of Wellington being invited by Her Majesty to assist in forming a new cabinet, he recommended Sir Robert Peel as the fittest person to be at the head of affairs; and Sir Robert having agreed to accept the premiership, proceeded to fill up the cabinet appointments. But here his first movement was an utter shipwreck, for it was a proposal that certain ladies of the bed-chamber, connected by close relationship with his political opponents, should be either dismissed, or persuaded to resign their offices. To a cool calculating politician this requirement may have appeared just and necessary in a female court, where ladies must naturally possess more than the usual influence of their sex; but by the public in general it was indignantly complained of as a most unchivalrous proceeding, which no argument of statesmanship could justify, while the queen at once rejected the proposal as being both contrary to usage, and revolting to her feelings. Such a long period, indeed, had elapsed since the days of Queen Anne, that politicians had to learn anew the application of established court usages to the emergencies of a female sovereignty. Finding this difficulty at the outset unsurmountable, Sir Robert rejected the offered premiership, and the Melbourne cabinet was restored to office. At the same time, Mr Abercromby, owing to ill health, resigned his office as speaker of the House of Commons; and Mr Shaw Lefevre, member for North Hants, the ministerial candidate, was elected in his stead by a majority of 317 against 299.

After this temporary bed-chamber interruption had subsided, parliament proceeded in its ordinary routine. And foremost among the measures presented for consideration, was a ministerial plan for a general and national system of education, proposed by Lord John Russell, in which a board, composed of a president, assisted by councillors not exceeding five in number, should preside over the distribution of the ministerial grants, and the management of the system in general, which was to consist of religious and moral as well as intellectual training. But here the high church party took the alarm at the latitude which it allowed to the different religious denominations, while the Dissenters themselves opposed it as too exclusively devoted to the interests of the Established Church. It was not in this fashion, or thus early, that the momentous question of the present day was to be settled. Another subject urgently brought before the attention of parliament by a message from the queen, was the administration of government in Canada, in which it was proposed that the upper and lower provinces should be united into one—a measure that was successfully accomplished in the following year. The obstacles to a complete suppression of the slave-trade still continued also Victoria.

1839.

Reign of to be the ground of parliamentary complaint and remonstrance, arising from the conduct of Portugal, which, although it had received an indemnity from the British government of L.800,000, on condition of suppressing negro slavery within its colonies, still continued to tolerate the evil, so that slave-ships pursued their wonted trade under Portuguese and Brazilian flags. At home also the Chartists, who had risen into such portentous strength as seriously to alarm the government, by transmitting a monster petition in behalf of their five points, signed by 1,200,000 of the working-classes, became so riotous on its rejection, especially at Birmingham, that the police force of that city had to be largely increased, and 5000 soldiers added to the military establishment. Even these precautions were insufficient, for towards the close of the year their discontent broke out into action. This was in Monmouthshire, where four or five thousand rioters, armed with various weapons, and headed by John Frost, a magistrate, attacked the town of Newport; but happily they were dispersed, after a few volleys of musketry by a handful of soldiers and policemen. One of the most important proceedings of this year was the plan of a uniform penny postage, devised by Mr Rowland Hill, and proposed to parliament by Mr Spring Rice, which was passed after a long and keen opposition. Although the vaticinations of its consequences were of the most alarming character, the plan soon justified the hopes of its supporters, by the benefits it conferred upon every class of the community.

In the parliament of 1840, which was opened by Her Majesty in person on the 16th of January, her approaching marriage with Prince Albert of Saxe Coburg-Gotha, was announced in the opening of the queen's speech; and on this occasion, the annual sum of L.30,000 was voted out of the consolidated fund as a provision for her royal consort.

Passing over the events of less importance by which this year was distinguished, we would now confine our attention to those melancholy disasters which awaited our arms in the East. For a long period, the chief dread of the security of our empire in India had arisen from the growing ambition of Russia, and its machinations with Persia and Afghanistan, of which last country Runjeet Sing, commonly called the Lion of Lahore, who was suspected of leanings towards the designs of Russia, had obtained dominion over the greater part by intrigue and conquest. In the course of these successful aggressions, Dost Mohammed, sovereign of Cabul, finding himself in danger of being dispossessed by the Lion of Lahore, had recourse to the British for protection; but as our Indian government was at peace with his enemy, the application was refused, whereupon he sought assistance not only from the Tartars, but also from Persia and Russia. In this way a door was opened for Muscovite intrigue and aggression. Instigated, as was alleged, by pecuniary aid from Russia, the Shah of Persia marched in July 1837, at the head of 40,000 men, from Teheran to Herat, to which he laid siege; upon which it was determined by our Indian government that the young sovereign of Persia should be driven out of Cabul, and Shah Sujah, one of the deposed Afghan kings, but now a British pensionary, placed upon the throne. In this way, it was hoped, a grateful ally would be secured, and a frontier barrier erected against Persian and Russian encroachments. Accordingly, in the middle of June 1838, a British army was landed at Karrack in the Persian Gulf, of which it took possession; and the Shah finding his own dominions thus invaded, broke up the siege of Herat, in which he had made little progress, and hastily retreated homewards. A city that was the key to our Indian possessions against Persia and Russia was thus fully recovered; but unsatisfied with this result, our Anglo-Indian government resolved to complete the work by the subjugation of Afghanistan itself. Accordingly war was declared by Lord Auckland, governor-

general of India, while the conduct of it was committed to Sir Henry Fane, the commander-in-chief of all India, who unwillingly undertook the charge, from a melancholy foreknowledge of the difficulties with which it was certain to be attended.

These difficulties were not long in commencing. The first was the refusal of Runjeet Sing to allow the British troops to cross his territories at the Punjaub, notwithstanding his previous agreement by treaty to that effect. Then came the treachery of the Ameers of Scinde, who had engaged to furnish provisions and the means of transport to our armies; but who, when the crisis arrived, not only broke their engagement, but turned against us, and attacked our troops in the mountain passes. Finally, the health of Sir Henry Fane, which had been affected at the commencement, so completely failed, that he was obliged to resign the command, which was conferred upon Sir John Keane; and this change occasioned others, that led to jealousy and misunderstanding among the officers, and produced some of the worst errors of the war. In spite of these and other obstacles, the Anglo-Indian army advanced, and was everywhere successful: Ghuzna was taken by storm, Cabul entered in triumph, and Shah Sujah seated upon the musnud. All danger being now thought at an end, Sir John Keane returned to England, where he was raised to the peerage by the title of Baron Keane of Ghuzna and Cappoquin, and Lord Auckland was rewarded with the rank of Earl. But while the whole nation triumphed in this conquest of Afghanistan, by which the British dominion was completed over India, the sagacity of the Duke of Wellington was not deceived. Understanding too well the nature of Eastern affairs, he expressed his apprehensions of a coming reaction, and that these conquests in Afghanistan were but the commencement of fresh difficulties.

These forebodings were but too well verified. withdrawal of our army, 8000 of the troops, British and Sepoy, were left at Cabul, independently of Shah Sujah's contingent, which was commanded by British officers. In the spring of 1840, as soon as the melting of the ice and snow had opened the mountain passes, hostilities were resumed by the Afghan tribes, aided by the Ameers of Scinde; and although our army was increased by reinforcements to 16,000, it seemed to be blockaded in a hostile country, rather than a force in successful military occupation, while already an expense equal to three millions per annum was the price of such an undesirable tenure. In November 1841, Sir A. Burnes, the British resident at Cabul, and two officers, one of whom was his brother, were attacked and murdered in their own house by the insurgent Afghans, whose formidable bands had surrounded the city and shut out all communication between the British army and the government; the British encampment itself was attacked; and our troops demoralized by the confusion of counsels that prevailed among their officers, fled from the commissariat fort, leaving their provisions, clothing, and stores in the hands of the enemy. A dangerous retreat or negotiation was now the only alternative, and unhappily the latter was adopted. For this purpose, Sir William Macnaughton, the British commander, went out from the cantonment to an interview with Akbar Khan and the other insurgent chiefs, and the latter agreed to allow the British army to retire without molestation, and furnish them with provisions and the means of transport. But instead of fulfilling their bargain, these faithless barbarians murdered all the sick and wounded that fell into their hands, and withheld the promised provisions; and when the British troops were exhausted with hunger, sickness, and severity of the weather, they rose in their demands, and insisted on a new treaty. A fresh interview followed, and Sir William Macnaughton was basely murdered in the midst of the conference. Utterly dispirited by this atrocious deed, the army abandoned all thought of re-

Reign of

Reign of sistance, and entered into such a composition to secure their further retreat as was new in the annals of British warfare, and astounding in the history of its Indian conquests, by agreeing to abandon all their guns except six, and all their treasures to the enemy; to give bills for the payment of five lacs of rupees; and to leave the married officers, with their wives and children as hostages until these terms were fulfilled. It was a miserable treaty for the conquerors of India to make-a treaty in which the væ victis was sure to be returned upon them in double and treble measure. The retreat purchased under such humiliating circumstances was as disastrous, proportioned to the number of the sufferers. as any which history has recorded. It was in the depth of winter, and 26,000 human beings, comprising soldiers, camp followers, women and children, are calculated to have perished by the severity of the weather, by privations of every kind, and by the swords of the perfidious enemy, who hung upon their march and cut down every straggler who was unable to keep up with his companions. In short, of the whole military force who were thought sufficient for the conquest and possession of any eastern kingdom, only a few sepoys and camp followers succeeded in escaping to Jellalabad, still held out by General Sale, who had cleared the pass of Khoord Cabul at the commencement of the insurrection, and who gallantly retained possession of the fortress notwithstanding the desponding orders of his superior, Elphinstone, to evacuate it.

A reverse so remarkable in the history of British conquest in India produced a correspondent depression, and it was resolved to obtain the liberation of the captive women and children by treaty and ransom. But this abject step, which would have destroyed our prestige in India, and commenced a train of disasters under which our eastern government would have been shaken if not finally overthrown, was happily abandoned, and a war of retrieval commenced. For this, Jellalabad afforded a centre and rallying point, as it was still gallantly held out by General Sale, who disturbed the leaguer of Akbar Khan by several successful sallies, and at length defeated him on the 7th of April (1842), in an open engagement, with only a part of the garrison. In the meantime, General Pollock, who had been pressing forward to the relief of the fortress, reached it nine days afterwards, when its provisions were all but exhausted, and the siege was instantly raised. The British army then advanced upon Cabul in the middle of August, and met with little or no resistance, the successful Afghan chiefs being now engaged in war with each other, and that too in the very neighbourhood of the city which it was their common interest to defend. At the same time, General Nott, who had gained two victories over the Afghans, and recaptured Ghuznee, advanced to effect a junction with Pollock. The chiefs who had hitherto sided with Akbar Khan, now turned against him; and a treaty in which pecuniary recompense was largely promised them by the British government was eagerly accepted. The consequence was, that after a liberal ransom, the officers, with their wives and children, who had been abandoned to the enemy as hostages, and who had been often menaced with the most infamous treatment, arrived in safety at headquarters, and were received by their friends as those who had escaped from a den of cut-throats, or even risen from the dead. Thus was humanity satisfied, and the British arms, for a time so woefully degraded, restored to their former lustre. The reaction also produced by the victories of Nott and Pollock in favour of our eastern ascendency was not confined to the turbulent chieftainry of Afghanistan: Burmah, Nepaul, and other independent states of Hindustan that had been on the eve of breaking out against our Indian government, and trying once more the chance of arms for its suppression, were now eager to renew the terms of former amity, and make fresh professions of peace.

Victoria.

1842.

This Afghan war was not the only eastern question that Reign of occupied the attention of our home government; the maintenance of the integrity of the Turkish empire, in which Britain has so deep an interest, was also at issue, in consequence of the ambition of Mehemet Ali, the most formidable of Ottoman viceroys. Soon after his accession, Abdul Medjid, the young Grand Seignor, had offered to his dangerous vassal a full pardon for the past, and the hereditary sovereignty of Egypt; but the Pacha, not contented with this, demanded possession of Syria also, by which Turkey would have been dismembered, and its very existence placed at his mercy. Upon this unreasonable demand which Mehemet had full means to enforce, the allied powers, England, Austria, Russia, and Prussia, interposed; and as the Sultan had no naval power for the recovery of Syria, his navy having deserted to the viceroy, the allied powers, who found that something more than remonstrance was necessary, entered into an agreement to that effect at London on the 15th of September 1840. Accordingly, a British fleet, aided by an Austrian naval and land force, reduced the city of Beyrout, defeated Ibrahim Pacha, and so effectually aided the Syrian mountaineers, who were disgusted with the oppressive rule of the Egyptian army, that the latter was compelled to retreat upon Acre. The city of Sidon was then captured; and on the 3d of November the British fleet advanced to the attack of St Jean d'Acre, that city which Napoleon regarded as the key of the east. But those ramparts which had resisted him so long and successfully, were in less than four hours battered to pieces by the British cannon; and our naval force, which only lost 12 men killed and 42 wounded in the attack, inflicted upon the enemy a loss of more than two thousand in killed, wounded, and prisoners. This signal victory destroyed the pretensions of Mehemet Ali, who yielded to the terms imposed upon him by the allies through Admiral Sir Charles Napier, the conqueror of Acre. These were, that he should give up the Turkish fleet to the Sultan, abandon for ever his claims upon Syria, and hold Egypt as an hereditary dependency of the Ottoman Porte. In this way the dismember-ment of Turkey was delayed. As for Napier, the Nelson of the war, his capture of Acre was declared by the Duke of Wellington to be one of the most brilliant of modern achievements, and he was honoured by a vote of thanks from both houses of parliament.

It was not merely in the Afghanistan war that our commercial interests in the East had for some time been in danger: in China also a war had been commenced against the British, originating in the alterations that had been made in the East India Company's charter, by which their exclusive monopoly in the China trade was abolished. The Chinese, who were immoderately addicted to the use of opium, had hitherto been supplied, though in limited degree, with that pernicious drug from India through the Company; but no sooner was the trade thrown open, than opium was poured into the Chinese market without stint, until its effects were soon felt as one of the worst of national evils. Alarmed at this, the Chinese government adopted a remedy in its own despotic fashion, by suspending all trade with the British, seizing and destroying the opium and other British property, and firing upon our ships in their passage up the river to Canton. These aggressions were so frequent, and the treaties that followed them were so ineffectual, that in 1840 war was proclaimed, and Canton blockaded by a British fleet. The result of the encounters that followed was such as might have been expected: the Chinese soon found that mere barbarism, courage, and numbers, were no match for European military science, discipline, and experience; and that when they had recourse to temporizing and treachery, these were only followed by fresh disasters. Thus matters went on in 1840 and the two following years, until the Chinese government was humbled into submission, and a

1843,

1842.

Reign of treaty was signed on the 20th of August 1842, in which they made full reparation. The principal concessions were, an indemnity of twenty-one millions of dollars for the destruction of the property of the British merchants, the cession to them of the island of Hong Kong in perpetuity, and the opening of the ports of Canton, Amoy, Foo-choo-Foo, Nang-po, and Shang-hai to their commerce, and that of other nations, with the right of establishing consuls at them, and the correspondence of the officers of both governments to be conducted on terms of perfect equality. In this way, and for the first time, the wedge was effectually introduced by which China, hitherto impenetrably closed against improvement, has been opened to the advance of European civilization, and the prospect of a new and better era.

The course of eastern warfare was once more shifted from China to India. The Ameers of Scinde, encouraged by the disasters of our army among the Afghan mountains in the retreat from Cabul, incensed at the loss of their transit duties on merchandise passing up and down the Indus, and apprehensive of losing their hunting-grounds upon the banks of the river by the continued encroachments of British dominion, took up arms for a general resistance. It was now full time to suppress these Ameers, as they were the rulers of a restless warlike people whom they were unable to control, and to whose cry for war and plunder they were compelled to yield. In addition to a former treaty of peace, which only a part of them had subscribed, a new one had been agreed to on the 14th of February 1843; but they broke it only the day after, by an attack upon the residence of the British commissioners. Against these dangerous enemies the brave old general, Sir Charles Napier, was sent; and on the 17th of February, two days after the violation of the treaty, he attacked them within twenty miles of Hydrabad, upon which city he was advancing. The Ameers, who had mustered a numerous army, gallantly contested the ground, and for some time made victory doubtful; but at length they were routed by the greatly inferior British force, who on this occasion rivalled the brightest achievements of the soldiers of Lake and Clive. Three days after the victory, the conquerors entered and took possession of Hydrabad; in consequence of which Scinde was reduced to a British province with Napier for its governor, slavery was abolished, and the Indus opened to the trade of every nation.

During the same year, and towards its close, a war was commenced with the Mahrattas, who had rebelled against their young Maharajah, whom we were bound by treaties to support, and committed other excesses that made chastisement inevitable. An army was sent against them under the command of Sir Hugh Gough, and a battle fought at Maharajpoor on the 29th of December 1843, in which the Mahrattas were defeated, though not without severe loss to the British, whose number almost equalled that of the enemy. Upon the same day a victory was obtained over a Mahratta force at Punniar by a division of the British army under the command of Major-General Grey. In consequence of this twofold defeat the Mahrattas submitted, and their country was garrisoned by military occupation. During this course of a four years' war, extending over Syria, India, and China, events at home were of such minor importance that we can scarcely afford them a passing glance. The principal affairs with which parliament was occupied, independent of these important movements in the East, were an alarming diminution in the revenue, and the question for the repeal of the corn-laws, which in consequence of the fall of the revenue was forced into final discussion. Against these restrictions on the importation of grain parliament had been petitioned in 1839; in 1841 the subject was resumed, with almost as much urgency as that which had carried the Reform bill; and, in the following year, the popular agitation for the repeal of the corn-laws was so over-

whelming, that a new cabinet under Sir Robert Peel, after Reign of carrying the property and income tax, found that it could do nothing less than abate, if it did not wholly abolish, these obnoxious restrictions. This accordingly was done by Sir Robert in March 1842, when his modification of the sliding scale, instead of an entire free trade in corn, was introduced and carried by a majority of 306 against

The year 1843 was memorable for an event in the history of the Church of Scotland. This was the voluntary separation of above four hundred ministers from the Established Church; a movement popularly known as the "Disruption," and which gave rise to that large and influential body calling itself the Free Church.

Previous to this occurrence the law of patronage, always obnoxions to the popular feeling of Scotland, had become such a ground of contention and fruitful source of dissent, that a majority of the General Assembly in 1834 embodied their views and resolutions upon the subject in the Veto Act, by which no minister was to be imposed upon a congregation where a majority, consisting of heads of families and communicants, subscribed against his admission. But patronage was too valuable a privilege both in the eyes of patron and presentee to be relinquished without a struggle; and in several cases where parishes exercised their right of veto against the entrance of a new minister, their decision was carried by appeal to the Court of Session, and there reversed as illegal. The ecclesiastical and civil courts were thus brought into hostile contact, and the claims of the church to independence and self-government in spiritual matters, as well as what constituted their spiritual character and the range they occupied, were the trying questions at issue. In this difficulty the only remedy for the General Assembly was to appeal to the House of Lords: but at this highest tribunal, the decisions of the Court of Session were confirmed, and the rights of patronage fully recognised. It was evident that the party in the church by whom the Veto Act had been framed, could no longer carry out their antipatronage principles, nor their views of spiritual independence with which it was connected; and as they had all along announced these as questions of conscience which they could neither abandon nor compromise, they had declared their purpose to forsake their livings rather than submit to that authority which the state claimed in church rule, by the final decision of the House of Lords. And this resolution they fully carried out at the meeting of the General Assembly in May 1843, by tendering their protest, subscribed by more than 400 ministers; after which they departed in procession to a large hall that had been prepared for the event, and there constituted themselves into what has since been called the Free Church of Scotland.

The affairs of India once more became the subjects of public attention. Lord Ellenborough, the governor-general, was recalled in April 1844, and Sir Henry Hardinge appointed in his room. The latter, on his arrival in India, found the Sikhs in a state of wild disorder in consequence of the death of the energetic Runjeet Sing, the Lion of Lahore, and ready to invade the British territories, which they soon afterwards did by crossing the Sutledge; upon which a military force that had been in readiness for the occasion was marched against them with great celerity. An encounter took place at Moodkee on the 18th of December 1845, and although the Sikhs were in great force and advantageously posted, as well as defended by a numerous artillery, in the use of which they had been trained by European officers, while the British, consisting of only four regiments of foot, and one of light dragoons, were exhausted with a long march, and provided with only a few six-pounders, the latter were victorious, although with a heavy loss in killed and wounded. Undismayed by this defeat, which fell only upon their advanced troops, the main army of the Sikhs on the opposite Victoria.

1845.

Reign of side of the river, crossed the Sutledge, with an overwhelming array of horse, foot, and cannon, and entrenched themselves at Ferozeshah. There a terrible engagement took place between them and the British, who were now not only reinforced with fresh troops, but aided by the presence of Sir Henry Hardinge, the governor-general, who on this trying occasion set aside his superiority of rank, and took the command of the left wing under Sir Hugh Gough. This great battle, to which that of Moodkee had been but a prelude, commenced on the 21st of December, and lasted two days; while the British, who were defective in cavalry and artillery, with which the enemy were abundantly provided, were obliged to depend upon the steadiness of their infantry, and charges of the bayonet. On this occasion the Sikhs were at last driven out of their camp after a gallant resistance, in which the British sustained a loss of more than two thousand in killed and wounded. After this double engagement, the Sikhs, still undismayed, entrenched themselves at Sobraon; but there they were attacked by Sir Hugh Gough on the 10th of February 1846, and in spite of their discipline under Italian and European officers, their numerous and well-served artillery, and great superiority of numbers, they were totally defeated, and driven across the Sutledge, while the British army entered the Punjaub. Lahore, the capital, surrendered at their approach; the authority of the young Maharajah, Goolab Sing, was restored; and all opposition terminated. Since that period, the affairs of India have been more tranquil, and our authority over its many provinces more confirmed than before.

While these eastern events were in progress, a great agricultural conflict had been carrying on at home, in which interests were at stake to the full as important as the extension of our commerce by foreign and colonial conquests. This was for the repeal of the corn-laws, which, having lasted their day, were now to be dismissed as mere wornout relics of departed feudalism. The agitation to that effect, chiefly conducted by Mr Cobden, had acquired a formidable consistency and strength by the organization of an anti-corn-law league, well furnished with influential names and pecuniary contributions; and at the close of 1845 the demand for a free trade was so loud over England and Scotland, that Sir Robert Peel and his cabinet, who were divided upon the question, gave in their resignation. A new ministry, however, could not be formed, and Sir Robert was persuaded to resume office only ten days after. But more urgent still than the fiercest popular clamour, was the failure of the potato crop, and the famine that followed, so that even the agricultural interest was obliged to acknowledge the necessity of a repeal. It was hunger that at last ate through these stone walls of protection, and prepared the openings for a free trade in corn; and it was Sir Robert Peel himself who brought into parliament a bill to that effect, which was passed through the House of Commons on the 16th of May 1845, and through that of the Lords on the 21st of June. With this daring experiment, not upon individual interests, but the national existence itself, the popular desire was satisfied, and the present famine forgot in the hopes of future abundance.

After the repeal of the corn-laws and establishment of free trade, by which Sir Robert Peel had sacrificed the principles of his past political life to the demand of stern necessity, and declaring his conviction that for this he would leave a name that would be execrated by every monopolist. he resigned office and was succeeded by Lord John Russell. The first consideration of the new ministry was the sugarduties, almost as obnoxious as the corn-laws themselves, and the repeal of which was almost as loudly demanded. As this could not at present be granted, a compromise was offered, by which a gradual diminution, extending over five years, was to meet the difficulty; but this measure was equally opposed by those who advocated the cause of our

West India planters, now deprived of cheap compulsory la- Reign of bour, and by those who were anxious for the entire abolition of negro slavery in those colonies where the evil still existed. Through the midst of this twofold opposition, the government proposal was carried by large majorities. During the present session of parliament also, a plan that had been proposed by the Peel administration was happily carried into effect, by which mercantile confidence, especially among the lower classes, was materially benefited. This was the establishment of local tribunals in every district of England for the recovery of small debts, over which about sixty local judges were appointed to go in periodical circuit, and hold courts in all the principal towns twice in every month. Such were the labours of this critical session of parliament, which was congratulated by the royal address "for the present relaxation and ultimate repeal of protective duties on

corn and sugar."

The year 1847 was signalized by political difficulties that would have tried the wisdom as well as tested the stability of any political administration. The commercial prosperity of 1845, so flattering at its commencement, had encountered a sudden shock chiefly through the disease in the potato crop, by which there was a deficiency in the available wealth of the country to the amount of several millions. But fearfully this calamity had fallen upon Ireland, where the potato constitutes the principal article of food, and for the loss of which an immediate remedy was urgently demanded. A whole nation was at the starving point. The opening of the session was, therefore, earlier than usual, the parliament meeting on the 19th of January, and the subject of Irish destitution was the chief subject of discussion. The temporary expedients proposed and adopted on this occasion were parliamentary labour upon the farms and public works, the reclaiming of waste lands, and the eleemosynary relief of gratuitous rations and soup-kitchens. The more permanent remedies introduced to the consideration of parliament, were the sale of encumbered estates, the conversion of long leaseholds into copyholds, and the construction of railways; for which changes it was stated that grants from government to the amount of sixteen millions would be necessary. But costly though the price was, these remedies were subsequently adopted, and put in practice. Other measures connected with Ireland that occupied the attention of parliament during the same session, had reference to the suppression of crime which had increased to a fearful amount, especially in the form of open murder, assassination, and conspiracies against the rights of property; and to suppress these evils, a bill was introduced and passed through parliament investing the Lord Lieutenant with almost dictatorial power, which was to continue in full force until the 31st of December 1849. It was wonderful how easily this measure passed through the ordeal of the Irish members, few opposing it except those of the O'Connell family. But for this silence there was sufficient cause, as their great leader, whose voice would have been loudest on such an occasion when his country was to be colonized by the Saxons, had ended his political career. Daniel O'Connell, the great tribune of Ireland, who had won as popular demagogue a more than kingly ascendency, died at Genoa, on his way to Rome, on the 15th of May 1847. But formidable as he was, he was but the John Wilkes of his day, rather than the Arteveldt or the Gracchus. Having served the temporary purposes to which he devoted himself, and won the shortlived renown for which he laboured, he is already all but forgot, not only in England which he so bitterly traduced, but even in Ireland where he was worshipped with almost religious veneration.

The troubles of our West India colonies, occasioned by the abolition of the slave-trade, were not yet ended, and parliament was occupied in 1848 with petitions from the planters and their adherents in Britain, praying for the re-

Victoria.

peal of restraints imposed upon emigration, for the removal of burdens on the supply of African labour, for an alteration of the navigation laws, and for an assimilation of the duties on colonial rum to those paid by the British distillers. These, with the exception of the petition about the navigation laws, were embodied in a bill presented to parliament by Lord George Bentinck, and the result was, that a loan of L.170,000 was granted for promoting the emigration of free labourers into the colonies of British Guiana and Trinidad, while a more extensive plan of relief was afterwards proposed by Lord John Russell, as necessary to save the West Indies from insolvency and ruin. This chiefly consisted of an additional loan of L.500,000, a reduction of the duty on colonial sugar, and a reduction of the differential duty on colonial rum; by which concessions a considerable step was made in appeasing the West India planters, and extricating them from their difficulties. A still more serious question was occasioned by the state of the public finances, a deficiency being anticipated for the next year, mainly occasioned by the expenses of the Caffre war, and estimated at L.3,200,000; and the remedy proposed was an augmentation of the income-tax from three to five per cent., to be continued for three years. This suggestion of aggravating an already obnoxious tax excited a general alarm, and called forth petitions from every quarter; and in the parliamentary discussions that followed, in which the idea of an increase was quickly abandoned, the questions at issue were, whether this income-tax as it originally stood could not be imposed in a more just proportion than by a uniform per-centage on incomes; or whether it could not be altogether repealed? These were alarming inquiries which it was found necessary to silence, and therefore to save the tax itself, a loan of two millions not drawn from the consolidated fund, but raised by an issue of Exchequer bills, or by a creation of stock, was proposed to meet the coming de-

While the nation was thus suffering from deficient harvests, mercantile depression, and a defective revenue, the magnanimity with which these evils were endured, and the energy with which they were surmounted, bore full evidence to the deep-rooted strength and stability of the British constitution. This was the more remarkable as contrasted with the rest of Europe, where almost every throne at this period was tottering, and royalty itself all but annihilated. An attempt, indeed, was made on the part of Chartism to avail itself of the universal commotion, but all that it could effect was a few monster meetings that evaporated in speeches, or paltry riots that were easily suppressed by the police. In Ireland also an attempt at open rebellion upon a grand scale ended still more contemptibly in a trifling skirmish in a cabbage garden, and the capture of Mr Smith O'Brien, the redoubted leader of the movement. Still agrarian riots, violence, and assassination, continued in that unhappy country as before, and with more formidable results than open rebellion, so that Irish affairs occasioned much parliamentary solicitude during the following year. To meet those difficulties arising from the destitution which the potato blight had occasioned, and which still continued to increase in severity, various temporary measures were adopted, that sufficed for a few weeks or months to hold the evil at bay, and give the sufferers a chance of recovery. But the most permanent benefit that could be imparted to such a country was the Encumbered Estates bill, proposed during the previous year, and now carried through both houses, by which land hitherto useless was thrown into the market, and made available to those who had wealth to purchase and spirit to cultivate it. In this way English and Scottish merchants became Irish proprietors; Saxon capital, perseverance, and skill, were brought to a rich but hitherto unproductive soil; and all gave promise that in a few generations more the marked superiority by which Ulster

stands alone will be fully shared by all the provinces of Ire- Reign of

An affair of scarcely less, if not of equal importance, which occurred during this year, was the repeal of the navigation laws, which also had been brought under the notice of parliament in 1848, but remanded for future settlement. The strictly exclusive character of these laws, which secured for Britain the monopoly of the colonial trade, the long-voyage trade, and the carrying or indirect European trade, had not only been a grievance to our colonies, especially to Canada, but was incompatible with those principles of free trade which were now a part of the constitution. Such, however, was the dread of foreign competition, and so great was the commercial interest at stake, represented by 4,000,000 tons of shipping, navigated by 230,000 seamen, that it was not wonderful if the boldest statesmen paused, or were hostile to the proposed abolition. But the navigation laws could not retain their hold consistently with our opened ports, and their final extinction was but a question of time which the present year decided. The bill, notwithstanding the strenuous opposition it encountered, was passed through both houses, and the 1st of January 1850 was the date at which it was to enter into full operation.

During the settlement of these important measures, and while peace still continued at home, a short but sharp war had broken out in India, where our dangerous enemies the Sikhs, notwithstanding their former defeats and subjection, had again risen against our Indian government, and commenced their insurrection with the murder of two British officers. The gallant resistance which they made in the field cast an ominous shadow over the security of our rule in India, until the public anxiety was tranquillized by the capture of Mooltan, a stronghold of the Sikhs, and their final defeat at Goojerat. As it was thought dangerous to enter into further treaty with such enemies, or continue to recognise them as an independent power, their country, the Punjaub, was annexed to our Anglo-Indian empire.

The triumph obtained by the free trade party in the abolition of the navigation laws was not lost upon the protectionists; and thinking that their opportunity had fully arrived, they followed up the movement of their opponents by similar appeals and arguments in behalf of the agricultural interest. For this purpose, a motion was made by Mr Disraeli, now the leader of the protection party, to throw a portion of the rates charged upon agricultural produce into the general taxation of the country. In favour of this demand it was stated, that as more than one-third of the whole revenue of the excise was levied upon home produce, it was unable to compete with the untaxed produce of foreign countries; and coming more closely to the argument of figures it was shown, that from a rental of sixtyseven millions, twelve were extracted by county rates, highway rates, church rates, poor rates, and the land tax. But though the complaints of the agricultural classes, owing to the depression which free trade had introduced among them, were both loud and formidable, the motion of Mr Disraeli was negatived by a majority of 280 to 189. In the following year, a more favourable opportunity still seemed to have arrived, as the excess of the national income over the expenditure was somewhat more than two millions; and accordingly the proposal was again brought forward in 1850, but only again to be negatived, on this occasion, however, by a diminished majority of 21, 252 being in favour of the protectionist bill, and 273 against it. A still greater parliamentary unanimity happily prevailed in favour of the claims of the colonies to a constitutional government—a benefit which, if not freely conceded, it was thought they would soon be strong enough to take without the formality of asking In this way the privilege of selfgovernment was claimed for the North American colonies, the South African colonies, the Australian colonies. Diemen's Land, and New Zealand. These demands were separately discussed; and after many amendments, such concessions were made as were judged best fitted for the Gailliarde. progress and necessities of each community. As for the Canadas, at present the most important of them all, little further remained to be done, as already they had been very closely approximated to the constitutional practice of Great Britain. The Australian colonies occupied the chief share of attention; already these golden regions were on the eve of revealing their exhaustless treasures, and providing the resources of that immense increase in population and prosperity which has no parallel in the history of colonization.

On the 1st of May 1851, the Great Exhibition of the Industry of all Nations was opened by the Queen with great splendour; it was visited by immense multitudes of both English and foreigners, and it was hoped that the friendly intercourse it had produced would tend to consolidate the peace which Europe had so long enjoyed. During the six months it was open, the receipts for admission amounted to L.505,107, which not only defrayed all the expenses of its construction, but left a surplus of L.150,000, which was expended on the purchase of a site for a National Gallery.

Two months after the close of the session of 1850, the nation was startled, as if by the alarm of a foreign invasion, by the arrival of a papal brief, establishing an episcopal hierarchy of its own in England. For this purpose the country was divided into one archiepiscopal and twelve episcopal sees, over which Dr Wiseman was to have the superintendence with the rank of cardinal and title of archbishop. To meet this arrogant assumption Lord John Russell proposed, on the 7th of February 1851, the Ecclesiastical Titles bill for preventing "the assumption of any title, not only from any diocese now existing, but from any territory or place in any part of the United Kingdom, and to restrain parties from obtaining by virtue of such titles any control over trust property." After many and protracted debates, and the discussion of numerous amendments, the bill passed by a majority of 263 against 46.

The bill for the admission of Jews into parliament, after passing the Commons by 202 against 177 votes, was rejected by the Lords by a majority of 36.1 The only remarkable financial operations of the session which opened on the 14th of February 1851, were the reduction of the coffee and sugar duties, and the abolition of the window-tax.

The ministry having suffered several defeats, though on questions of no great importance, it became apparent that their hold on the house was by no means firm; for while they were vigorously assailed by their opponents they were faintly supported by their adherents. Conscious that with such lukewarm support they could not safely carry on the government of the country, Lord John Russell and his col-

leagues gave in their resignation, and Earl Derby was called to form a new cabinet; but after several attempts he declared his inability to do so. The Duke of Wellington then advised her Majesty to send for Lord John Russell and instruct him to resume office with his late colleagues. The ministry, however, did not continue long united; on the 22d of December the country was surprised with accounts of the dismissal of Lord Palmerston from the foreign office. The ministry, however, were soon made to experience the disadvantage of converting his lordship into an opponent; he made his power be felt by proposing and carrying an amendment to the ministerial Militia bill. Lord John Russell then declared that, having lost the confidence of the house, the ministers resolved to resign, and on the 23d of February Lord Derby and his colleagues entered upon office. They hardly met with any opposition during that session, as the bills they introduced were in substance the same as those proposed by the previous government.

Parliament was dissolved in July, and the elections commenced with all the usual excitement; but the protectionist candidates had considerable difficulty in accommodating their previously expressed opinions, so as to satisfy the electors who had now experienced the benefit of the free-trade measures, which had resulted in commercial prosperity, cheapness of provisions, and abundant employment to the labouring classes.

They generally professed a kind of acquiescence in those measures and their resolution to make no attempts to counteract them; but after making every exertion, and using all their influence, they failed to secure a protectionist majority, and Mr D'Israeli, the new Chancellor of the Exchequer, having introduced his budget, after several nights' debate, and recriminating speeches, the ministry were in a minority of 19, in consequence of which they tendered their resignations and retired from office on the 20th Dec. 1852.

During this year, however important were public events, there was one incident that abated the keenness of political interest, and threw a gloom over the public mind. This was the death of the Duke of Wellington, who, worn out with the toils of a long and most eventful life, expired at Walmer Castle on the 14th of September 1852, in the eighty-fourth year of his age. For such a man, all present eulogium is superfluous; he is one of those few characters who belong to all time. The greatest of modern warriors, he died in the midst—but unhappily at the close—of a long European peace, which his victories had chiefly tended to procure: an ardent disinterested patriot, as well as wise politician, his day was closed amidst the promise of national prosperity. Such a death most fitly terminates a great epoch in the history of this country.

BRITISH GUM is made by heating starch in an oven to between 600° and 700°, when its cells (as seen under the microscope) become obliterated, and it acquires a brown colour, together with the properties of gum. It is used largely in calico-printing to thicken the colours.

BRITANNICUS, son of the emperor Claudius by Messalina, was born A.D. 42. He was excluded from the empire after his father had married Agrippina, whose son Nero ascended the throne, and caused Britannicus to be poisoned, A.D. 55. (See ROMAN HISTORY.) BRITTANY. See Bretagne.

BRIVES-LA-GAILLIARDE, the capital of the arrondissement of Brives, department of Corrèze, France, is situated in a rich plain on the left side of the Corrèze, 14 miles S.W. of Tulle. It has manufactures of cotton, woollen, and silk goods, and an extensive trade in truffles. Pop. (1851) of arrondissement, 116,640; of town, 8413.

BRIXEN, a city in the Tyrol and circle of Pusterthal, at the confluence of the rivers Eisack and Rientz. It is the seat of a bishop, and has a fine cathedral, a theological seminary, and a gymnasium. Pop. 3500.

BRIXHAM, a town in the parish of the same name, in the county of Devon, 200 miles from London, on the south side of Torbay. It has an ancient church, a national, endowed, and other schools, and a very extensive fishing and coasting trade. Market-days, Thursday and Saturday. It is celebrated as the spot where King William landed in 1688. Brixham has become a place of resort for seabathing. Pop. (1851) 5627

BROACH, a town of Hindustan, in the province of

¹ Since then, Jews have been rendered admissible by the clumsy expedient of the Oaths Bill, which was passed in July 23, 1858, by which either house of Parliament may resolve that any person professing to be a Jew may, in taking the oath, omit the words, "I make this declaration on the true faith of a Christian."

Broach Brocchi.

Guzerat, presidency of Bombay, situate on an elevated mound, supposed to be artificial, on the northern bank of the Nerbudda, about 30 miles above its mouth. The river is here a noble sheet of water, two miles wide at ebb-tide, but shallow for the most part even at flood-tide, though there is then a deep but intricate channel admitting vessels of considerable burden. As, however, the Nerbudda is at some seasons unnavigable between Broach and the sea, except for vessels not exceeding 50 tons, the place does not appear destined to become an extensive port for large vessels. The town is surrounded by a wall, and contains between 3000 and 4000 houses, with a population, irrespective of the suburbs, of 13,000 inhabitants. Like the generality of eastern towns, its streets are narrow, and the houses lofty. It has a considerable trade, and annually exports large quantities of raw cotton to Bombay. Broach is thought, with some appearance of probability, to have been the Barygaza of Ptolemy and Arrian. Upon the conquest of Guzerat by the Mussulmans, and the formation of the state of that name, Broach formed part of the new kingdom. On its overthrow by Akbar in 1572, it was annexed to the Mogul empire, and governed by a nawaub. The Mahrattas became its masters in 1685, from which period it was held in subordination to the Peishwa until 1772, when it was captured by a force under General Wedderburn (brother to Lord Loughborough), who was killed in the assault. In 1783 it was ceded by the British to Scindia in acknowledgment of certain services. It was stormed in 1803 by a detachment commanded by Colonel Woodington, and finally ceded to the East India Company by Scindia under the treaty of Serji Anjengaum. Distant north from Bombay 190 miles. Lat. 21. 42. Long. 73. 2.

The British district, of which this town is the capital, is situate between Lat. 21. 22.—22. 11., and Long. 72. 30.— 73. 10., and is bounded on the west by the Gulf of Cambay. It contains an area of 1319 square miles, with 429 villages, and a population, according to a late census, of 290,984

inhabitants.

Broach, or Brooch, Brocha (from the French broche), an awl or bodkin. A spit is sometimes called a broach; and hence the term to broach a barrel.

The ornament known as the Highland broach, brooch, or brotche, is used, like the fibula of the Romans, to fasten the plaid. It is usually made of silver, of a round figure, with a tongue crossing its diameter. There are preserved in several families ancient brooches of very elegant workmanship, and richly ornamented. One of the most beautiful is the wellknown Hunterston brooch. Some of these brooches are inscribed with names, to which particular virtues used to be attributed; others have receptacles for relics, and are supposed to have been regarded as amulets. (See Pennant's Tour in Scotland, i. 90, iii. 14.)

BROAD PIECE, a name given to certain gold coins larger than a guinea; particularly the Carolus and Jacobus. Broadside, a discharge of all the guns on one side of a

ship at the same time.

BROADSTAIRS, a small seaport-town of England, county of Kent, and parish of St Peter, on the east coast of the Isle of Thanet, two miles from Ramsgate. It is much frequented as a watering-place, and has many good lodginghouses, two public libraries, warm baths, &c. Its port is subordinate to that of Dover. Pop. (1851) of parish, 2975.

BROCADE (Spanish, brocado), a stuff of gold, silver, or silk, raised and enriched with flowers, foliages, and other ornaments. Formerly the word signified only a stuff woven all of gold, both in the warp and in the woof, or all of silver, or of both mixed; at present all stuffs which are raised and enriched with flowers or other figures are called brocades.

BROCCHI, GIOVANNI BATTISTA, a celebrated Italian mineralogist and geologist, was born at Bassano in February 1772. He studed in the university of Pisa, where his attention was especially turned to mineralogy and botany. Brock

In 1802 he was appointed professor of botany in the new Lyceum of Brescia; but he more particularly de-voted himself to mineralogy and geology, in the numerous Brocklesby excursions he made into the adjacent districts. The fruits of these labours appeared in different publications, particularly in his Treatise on the Iron Mines in the department of Mella, and his Essay on the Physical Constitution of the Metalliferous Mountains of the Valley of Trompia, which appeared in 1807. His valuable researches procured him, in the following year, the office of inspector of mines in the recently established kingdom of Italy; which enabled him to extend his investigations over a great part of Central and Southern Italy, as well as its northern districts. In 1811 he produced a valuable memoir On the Mineralogy of the Valley of Fassa and the Tyrol; but his most important work is the great Geologia Fossile Subapennina, con Osservazioni Geologiche sulle Apennini, e sul suola Adjacente, which was published at Milan, in 2 volumes 4to, in 1814. In this work we have most accurate details of the structure of the Apennine range, and an account of the fossils of their strata; subjects further illustrated by his valuable geognostic map and his Catologo raggionato di una Raccolta di Rocche, disposto con ordine Geografico, por servire d'Illustrazione della Carta Geognostica dell' Italia. This last work also appeared at Milan in 1817. His work Dello Stato Fisico del Suolo di Roma, with its accompanying map, is admirable for accuracy and judgment. In it he has corrected the erroneous views of Breislak, who conceived that the Eternal City occupies the site of a volcano, to which he ascribed the tuffa and other volcanic materials that cover the seven hills. Brocchi, on the other hand, has satisfactorily shown that they are derived either from Mont Albano, an extinct volcano 12 miles from Rome, or from Monte Cimini, still further to the north of the city. Indeed he has shown, that the streams or beds of tuffa may be traced almost uninterruptedly from that mountain to Rome.

 ${f R}$ 

Several minor papers by him, on other mineralogical subjects, appeared in the Biblioteca Italiana from 1816 to

1823.

In that year Brocchi sailed for Egypt, and engaged with his usual ardour in exploring the geology of that country and its mineral resources, in which he obtained every facility from Mehemet Ali. In 1825 that politic ruler appointed Brocchi one of a commission to examine and organize his conquest of Sennaar; but the naturalist, unfortunately for science, fell a victim to the climate, at Khartum, in September 1826.

BROCCOLI, a kind of cabbage. See Horticulture. BROCK, a badger; or a hart of the third year.

BROCKEN, or BROCKSBERG, a mountain of Prussia, the highest point of the Hartz mountains, is in Lat. 51. 51. N. Long. 10. 39. E. It is 3740 feet in height, and is remarkable for the singular optical phenomenon called the "Spectre of the Brocken."

BROCKLESBY, RICHARD, a physician of considerable reputation, was born in Somersetshire, August 11th, 1722. He was educated at Ballytore, in Ireland, studied medicine at Edinburgh, and finally graduated at Leyden in 1745. In 1751 he was admitted a licentiate of the Royal College of Physicians at London, of which he afterwards became a fellow. In 1758 he was appointed physician to the army; in which capacity he served in Germany during the greater part of the seven years' war, and in the course of it was chosen physician to the hospitals for British forces. his observations during this period were published in 1764, under the title of Economical and Medical Observations, from 1738 to 1763, tending to the improvement of Medical Hospitals, one vol. 8vo. He had already, however, given to the public many proofs of the activity of his mind and the variety of his attainments, by papers which appeared in the Transactions of the Royal Society. His Dissertation on

Bay

Broker.

Brodeau the Music of the Ancients appeared in 1749, and his Oratro Harveiana in 1760. Shortly after this he was appointed by the Duke of Richmond, physician-general to the royal regiment of artillery and corps of engineers—an appointment that gave him constant access to the laboratory of Woolwich; and it was by his advice that a professorship of chemistry was added to the establishment of the college.

In his latter years he withdrew altogether into the retirement of private life. The circle of his friends comprehended some of the most distinguished literary men of the age. His intimacy with Burke had commenced at school, and soon ripened into the warmest friendship. , He was also warmly attached to Dr Johnson, and attended him in his last illness with assiduity and kindness. He had conferred many kindnesses upon the great moralist during his lifetime, of which the following may be taken as a sample. Understanding that Dr Johnson wished to visit the Continent for the recovery of his health, he offered him an annuity of L.100 during the remainder of his life; and when this offer was declined, pressed him to reside in his house, as more suited to his health than the one in which he then lived. The same generous disposition was manifested in his conduct to Burke, to whom he transmitted L.1000, as a legacy he had intended to leave him by will. Dr Brocklesby expired suddenly. He left his entire fortune, with the exception of a few legacies, between his two nephews Dr Thomas Young and Mr Beeby. (P. M. R.)

BRODEAU, or BRODEUS, JOHN, a celebrated French critic, was born at Tours in 1500. He studied civil law under Alciati, but afterwards devoted himself wholly to languages and the belles lettres. He travelled into Italy, where he became acquainted with Sadolet, Bembo, and other eminent men; and applied himself to the study of mathematics, philosophy, and the sacred languages, in which he made no small proficiency. On returning to his own country, he continued to prosecute his studies with indefatigable zeal, till his death in 1563. His chief works are Commentaries on the Anthologia, Basel, 1549; several books of miscellanies; Notes on Martial, Euripides, &c., Basel, 1558.

BRODERA, or BARODA, a large and wealthy town of Hindustan, in the province of Guzerat, and the capital of the Mahratta prince, known by the family appellation of the Guicowar. It is intersected by two spacious streets, which divide it into four equal parts, and cross at the marketplace. The houses, built of wood, are generally lofty, with sloping, tiled roofs. Among the principal buildings are the British residency, and the palace of the Guicowar; but these edifices, though of large dimensions, are not of imposing ap-Outside the town is the British cantonment, consisting of a number of small brick houses, with trellis work and wooden verandahs, and containing a small church built in the Gothic style of architecture, and capable of accommodating 400 persons. Luxuriant groves surround the town; and within these numerous mosques and Mussulman tombs have been erected, giving an impression of solemnity to the scene; and interspersed are some magnificent wells, with architectural decorations, having grand flights of steps descending to the water through rows of stone pillars. The fortifications of the town are of no great strength. They consist of slight walls with towers at irregular distances, and several double gates. The population is estimated at 140,000. The founder of the family of the Guicowar was one of the chiefs of the great Mahratta confederacy, who acknowledged the rajah of Sattara, the descendant of Sevajee, as their head. His name was Pelajee Guicowar; and in the year 1721 he had been promoted to be second in command of the Mahratta armies. Shortly after, he built the fort of Soneghur on the banks of the Taptee, and from this stronghold he made predatory excursions, which resulted in the

extension of his authority over the province of Guzerat.

Pelajee was murdered in 1732, by the Rajpoot, rajah of Brodick Joudpore, and succeeded by his son Damajee, who being taken prisoner by the Peishwa, regained his liberty by the sacrifice of one-half of his possessions, and under the acknowledgment that he held the remainder in fief to the Peishwa. Damajee dying in 1768, the succession was disputed between his two sons, and ultimately decided in favour of Syajee the younger, to the exclusion of Govind Rao the elder, who, however, ascended the throne in 1792, upon the death of Syajee. In 1800 the government devolved upon Annund Rao; and with this prince the British government concluded a treaty, and thereby secured his independence of the Peishwa. Annund Rao was succeeded in 1819 by Syajee Guicowar, the present ruler, whose revenues are computed at about L.668,700 per annum. The military establishment of this prince, in addition to his regular troops, amounting to 6000 cavalry and infantry, comprises also the subsidiary force furnished by the British government, which consists of five regiments of infantry, two regiments of cavalry, and a company of artillery. He also maintains a contingent force of 3000 cavalry, with a corps of irregular horse, commanded by British officers. His dominions, over which the government of India exercise political superintendence, are described in the article Guze-RAT. The Guicowar has it in contemplation to connect Baroda by railway with Tunkaria, on the coast of the Gulf of Cambay, the intervening distance being about 40 miles. Baroda is distant from Bombay, north 231 miles; from Calcutta, west 980. Lat. 22. 16. Long. 73. 14.

BRODICK BAY. See ARRAN.

BRODY, a large town of Austrian Galicia, circle of Zloczow, 58 miles E.N.E. of Lemberg. It is ill built and dirty, and the houses are mostly of wood; but it carries on an extensive transit trade with Russia, Poland, and Turkey, and has considerable manufactures. It is the seat of a mercantile tribunal, and has a castle, one Catholic and two Greek churches, three synagogues, grammar and commercial schools, theatre, hospital, &c. In 1779 Brody became a free commercial town. Pop. 25,000, of whom about fivesixths are Jews.

BROGUE (Gaelic brog), a kind of shoe used in the Scot-

tish Highlands, and by the Irish.

BROKE, SIR ROBERT, an eminent lawyer, son of Thomas Broke, Esq. of Claverly in Shropshire, was educated at Oxford, whence he removed to the Middle Temple. In 1542 he was chosen summer reader, and in 1550 double reader. In 1552 he was made serjeant-at-law; in the year following, lord chief-justice of the common pleas; and about the same time received the honour of knighthood. He was also recorder of London and speaker of the House of Commons. He died in 1558, and was buried at Claverly. Wood gives him the character of a great lawyer and an upright judge.

BROKER. Some derive this word from the French broier, "to grind;" others from brocarder, "to cavil, or higgle;" and others again from a trader broken, and that from the Saxon broc, "misfortune."

A broker is an agent or intermediate person appointed for transacting special business on account of another, but differing somewhat from an ordinary factor in functions and responsibility. Of this class there are various descriptions, exercising employment without the smallest analogy, though all are brought under the general name of brokers; and of these the principal are, exchange-brokers, whose province is to ascertain the rates and relation of exchange between countries; stock-brokers, who negotiate transactions in the public-funds; insurance-brokers, who effect insurances on lives or property; and pawn-brokers, who advance money on goods, on the condition of being allowed to sell the goods, if the sum advanced is not repaid with interest, within a limited time. See Agent, Insurance, and Sale.

Separating pawn-brokers, and those dealers in old wares

Bromberg who are called brokers, as both distinct from the class to whom the term in its broader acceptation applies, the broker is an agent for both parties, the buyer and the seller; and for the general principles of jurisprudence applicable to his position, reference may be made to the word Agent. It is a marked peculiarity, however, of the broker as an agent, that his quality of agency is not only palpable in the face of the transaction, but he is agent for both parties, and therefore those subtle niceties of law which arise out of the agent acting as principal, cannot apply to this class of agencies. The function of the broker is indeed a very simple one, and easily separates itself from the usual intricacies of the law of sale and of agency. It is his proper function to find buyers and sellers, and to bring them together that they may transact with each other. Hence the rise of such a class in any department of business, is an indication of its great increase. In small towns, and in narrow and peculiar departments of business, the buyers and the sellers know each other, and need not be at the expense of employing a third party. But where both bodies are numerous, and the individual members of each find enough to occupy their attention in the production of their commodity, or its purchase and distribution, there is economy in the establishment of a distinct class who bring the buyer and the seller together. The late enlargement of the railway system has created a peculiar and extensive system of brokerage transactions. They are affected by the statutory regulations applicable to railway companies; and all kinds of joint-stock brokerage are more or less affected by the late legislation as to joint-stock companies in England and Ireland (see 7th and 8th Vict., c. 110). The brokers for the purchase and sale of goods within the city of London are a body with peculiar privileges, and acting under special licensing regulations, some of which date back to the reign of Henry VIII. (л. н. в.)

BROMBERG, one of the governments of the Prussian province of Posen, is bounded N. by West Prussia, E. by Poland, S. by the government of Posen, and W. by the province of Brandenburg. Area 4547 square miles. It comprehends 9 circles, 54 towns, and 1302 villages, with (in 1849) 454,675 inhabitants, of whom 251,432 are Catholics, and the remainder Protestants of various sects, with 24,428 Jews. The soil is generally a light sand. The face of the country is level, and a great portion of it is covered with woods. The agricultural productions are insignificant, being scarcely sufficient for the subsistence of the inhabitants.

Bromberg, the capital of the above government, and also of a circle of the same name, stands on the river Brahe, 70 miles north of Posen. It has manufactures of linen and woollen stuffs, leather, tobacco, sugar, chicory, Prussian blue, &c., and an active transit trade. The canal of Bromberg connects the Brahe with the Netz, and thus establishes communication between the Vistula, the Oder, and the Elbe. Pop. (1849), including the military, 12,852.

BROME, ALEXANDER, an English poet, was born in 1620, and died in 1666. He was an attorney in the lord mayor's court, and was the author of the greater number of the songs and epigrams that were published in favour of the royalists, and against the Rump, as well in Cromwell's time as during the Rebellion. These, together with his epistles and epigrams translated from different authors, were all printed in one volume octavo after the Restoration. He published a translation of Horace, by himself and others; and was the author of a comedy entitled The Cunning Lovers. He also edited two volumes of Richard Brome's plays.

Brome, Richard, a dramatic writer in the reign of Charles I. and a contemporary of Dekker, Ford, Shirley, and others. He was originally a servant of Ben Jonson; but he soon acquired a high literary reputation, and was addressed in some lines by his quondam master on account of his

comedy entitled The Northern Lass. Brome's genius lay Bromelia entirely in comedy. His plots are original, and far from Bröndsted. being ill conducted; and his characters, which for the most part are strongly marked, were the offspring of his own experience, and close attention to the foibles of the human heart. He has left fifteen comedies.

BROMELIA, the PINE-APPLE. See HORTICULTURE. BROMINE, a remarkable fluid discovered in 1826 by Balard. See CHEMISTRY.

BROMLEY, a market-town in the hundred of Bromley and Beckenham, lathe of Sutton-at-Hone, and county of Kent, ten miles S.E. of London. It consists chiefly of one long street with some good houses, and has an old markethouse, savings-bank, literary institution, and a college for the residence and support of 40 widows of clergymen. church is a fine Gothic edifice, containing some handsome monuments; and in the vicinity is a palace belonging to the bishops of Rochester. Pop. of parish (1851) 4127.

BROMSGROVE, a market-town of England, in the county of Worcester and hundred of Halfshire, near the Birmingham and Gloucester railway, 13 miles S. by W. of the former town. The church is a fine old building, with a tower and spire 189 feet in height. grammar school, founded by Edward VI., has 7 scholarships and 6 fellowships in Worcester College, Oxford. It formerly returned two members to parliament. Its principal manufactures are nails, buttons, needles, and coarse linen stuffs. Market-day, Tuesday. Pop. (1851) 4426.

BROMYARD, a market-town and parish in the county of Hereford, on the river Frome, 125 miles from London. It is situated in a fine orchard district, but is old and ill built, many of the houses being of wood. It has a collegiate church, a free grammar and a national school, almshouses, &c. Market-day, Tuesday. Pop. (1851) 1394.

BRONCHITIS, an inflammation of the bronchi or tubes by which the lungs are supplied with air. It may be acute

BRÖNDSTED, Peter Oluf, an able and judicious archæologist, was the son of a Danish clergyman, and was born at Horsens in Jutland on 17th Nov. 1781. He received his academical education at the university of Copenhagen; and in 1802 he visited Paris in company with his friend M. Koes. After remaining there two years, he accompanied the same gentleman to Italy. Both were zealously attached to the study of antiquities; and congeniality of tastes and pursuits induced them both in 1810 to join Baron Stackelberg, Von Haller, and Linckh of Stutgard, in an expedition to Greece, where they examined with attention the interesting remains of ancient art, and engaged with ardour in excavations among the ruins, which were carried on extensively, especially by Bröndsted and Stackelberg, with very interesting results. The discoveries which Bröndsted made have been since given to the world in several works, which show learning and sagacity seldom applied to the elucidation of antiquity with happier results. After three years of active researches in Greece, Bröndsted returned to Copenhagen, where, as a reward for his labours, he was appointed professor of Greek in the university. He now began to arrange and prepare for publication the vast materials he had collected during his travels; but finding that Copenhagen did not afford him the desired facilities, he exchanged his professorship for the office of Danish envery at the papal court in 1818, and took up his abode at Rome. He also, in 1820 and 1821, went to Sicily and the Ionian Isles to collect additional materials for his great work; and when the artistic illustrations were completed, he obtained leave to visit Paris to superintend the publication. In 1826, he came over to London, chiefly with a view to st udy the Elgin marbles and other antique reliques in the Brit ish Museum, and became acquainted with the principal a :chæologists of England.

His great work appeared at Paris, in parts, in two editions, with a French text, one in quarto and the other in folio, besides a quarto one with German text. The first appeared in 1826, the second in 1830. Eight parts were promised, but only two had appeared at his death. The title of this admirable work, which contains many recently discovered and till then unpublished Grecian remains, with charts and numerous vignettes, is Voyages dans Grèce, accompagnés des recherches archéologiques, et suivis d'un aperçu sur toutes les entreprises scientifiques, qui ont eu lieu en Grèce depuis Pausanias jusqu' à nos jours.

He returned to Copenhagen in 1832; when he immediately received the appointment of director of the royal museum of antiquities, and the professorship of archæology His merits were ten years afterwards further and philology. rewarded with the honourable office of Rector of the University; but an unlucky fall from his horse caused the death

of this eminent man on the 26th of June 1842.

Besides the great work above noticed, Bröndsted wrote numerous dissertations on archæological subjects, which he illustrated with great learning. Among these we may notice two published by the Dilettanti Society of London, viz., A description of thirty-two painted Greek Vases, found near Vulsci, 1832; and on the Bronzes of Siris, 1836. (T. S. T.)

BRONGNIART, ALEXANDRE, a distinguished French mineralogist, was the son of the eminent architect who designed the Bourse and other public buildings of Paris, and was born in that city in 1770. At an early age he joined the army of the Pyrenees; but having committed some slight political offence, he was thrown into prison, and detained there for some time. On his release he was appointed professor of natural history in the Collége des Quatre Nations, and soon after succeeded Haüy as professor in the school of mines. In 1800 he was made director of the Sèvres porcelain factory, in which he revived the almost forgotten art of painting on glass. He did not confine himself entirely to mineralogy, for it is to him that we owe the division of reptiles into the four orders of Saurians, Batrachians, Chelonians, and Ophidians. In 1816 he was elected into the Academy; and in the following year he visited the Alps of Switzerland and Italy, and afterwards Sweden and Norway. The result of his researches he published from time to time in the Journal des Mines and Dictionnaire des Sciences Naturelles. He died at Paris, October 7. 1847. His principal works are Traité Elémentaire de Minéralogie appliquée aux Arts; and the Tableau des terrains qui composent l'écorce du globe, ou Essai sur la structure de la partie connue de la terre. Brongniart was also the coadjutor of Cuvier in the admirable Essai sur la Géographie Minéralogique des Environs de Paris.

BRONTE, a city in the intendency of Catania, in Sicily. It stands in a healthy situation on the river Giaretta, near a celebrated water-fall. It has considerable manufactures of linen and woollen cloths, and some paper-mills. Good wine is produced in the neighbourhood. Bronte gave the title of duke to the late Lord Nelson. Pop. 9500

BRONTEION, in Grecian Antiquity, a machine used in the theatre to imitate thunder. It consisted of large brazen vessels containing stones, and was placed beneath the stage

BRÖNTOLOGY (βροντη and λογος), a discourse upon thunder, or an explanation of its causes, phenomena, &c.

BRONZE.—A combination of metals which has received the name of bronze was employed by the ancients in the fabrication of different utensils, and in casting busts, statues, and other objects. The Egyptians, Greeks, and Romans, used this compound metal in the greater part of the decorations of those magnificent temples and palaces whose ruins only have remained to later eras. But amidst the general wreck there are still some fragments preserved, which in-"cate the perfection which had been attained in the employ- tutes the value of bronzes, not the colour, because it is the

ment of bronze. The wealth of some ancient cities was esti- Bronze mated by the number of their brazen statues; and Delphos, casting. Athens, and Rhodes, are reported to have each possessed three thousand. Some distinguished Romans adorned the public edifices of their city in this manner; and so strong a propensity was excited for multiplying works of this kind, that an observation became current, that in Rome the people of brass were not less numerous than the Roman people. It has been remarked, that the works which we now execute in iron or steel were little known to the ancients; that their arms and armour were usually of brass, or the compound now alluded to; and that a set of surgeon's instruments consisting entirely of bronze was discovered at Pompeii.

The ancient bronzes are alloys of copper and tin. examined by Klaproth, Davy, and others, whether from Egypt, Greece, or Italy, contain from 11 to 13 per cent. of tin. Nearly the same proportions are used in modern bronze in casting statues. Steell of Edinburgh, in his fine statue of Wellington, used 90 of copper and 10 of tin; proportions used also by Chantrey and Westmacott. The best gun-metal consists of 96 of copper and 11 of tin.

Bronze is extremely hard and sonorous, more brittle than brass, and more fusible than copper; from which, and its not being liable to tarnish, it is peculiarly adapted for casts of statues. Various nations have compounded the metals employed in different proportions. The Egyptians are said to have taken two-thirds of brass and one-third of copper. According to Pliny, the bronze of the Grecians was formed in the same way, with the addition of one-tenth part of lead and a twentieth of silver; which proportions were adopted by the Romans. In modern times bronze is generally composed of two-thirds of copper and one-third of brass; and sometimes small quantities of lead and zinc have been added. These latter render the cast more compact and brilliant; and the combination of different substances occasions the readier fusibility of the whole than when separate. The ancient bronzes, however, present a difference in appearance and composition from those executed by the moderns; and the fact is ascertained in respect to the metallic proportions, on analysis by skilful chemists. An illustration of this fact is sometimes given in the four celebrated horses of bronze, supposed to be the work of Lysippus, a Greek artist; which were brought from Venice, by command of Bonaparte, to the Tuilleries at Paris, and, on the fall of that extraordinary man, restored to their original position.

Bronze-casting.—The casting of bronze statues is a nice and difficult art, requiring long experience and the judicious management of a great apparatus. An exact model must be made of the subject to be cast, and nicely coated over with wax not less than an inch thick, on which the artist works the impression meant to be taken. A mould is then formed, consisting of several hollow pieces of wood or other resisting substance, filled with a mixture of clay and sand, which is applied to the model, in order that its outline may be received. The mould being united together, is perforated by a number of channels, and the melted metal being discharged from a furnace by means of these into the interior, thus produces the cast. When cold, the external covering is taken off, and the subjects appear as if covered with spines, which are the channels filled with metal: these are removed by saws, files, and chisels; and any imperfections on the surface being corrected, the whole is completed. But this in detail is a tedious, laborious, and expensive process; and the difficulty of producing beautiful works in bronze conspires to give them a high value in the estimation of the lovers of the arts. Seldom does the natural colour of the composition remain unaltered, but with the lapse of time it tends to black, or particular shades of green; though some artists render it black artificially, or give it a green colour from the first. It is the delicacy of the workmanship, however, that consti-

Bronzing. former alone which constitutes the difficulty, and calls for the skill of the artist. Colossal figures are sometimes obtained in bronze; but more usually, when of very large dimensions, they are formed by the union of several pieces, and are hollow within; as is also the case with some of those of smaller size. See Foundery.

Bronzing.—The substances on which bronzing is employed are either metals, wood, ivory, clay, or plaster; but more general preference is given to wood or plaster. The colours are of various shades and intensity; their composition and application being in a great measure arbitrary, according to the will of the artist. This art is nothing but a species of painting, far from the most delicate kind; and, when applied to plaster figures, may be done either with or without cement, the latter rendering it more durable. One principal ingredient in bronzing is gold powder, for the preparation of which the following receipt is given. A quantity of leaf-gold is ground with virgin honey on a stone, until the texture of the leaf be completely broken, and the parts divided to the most minute degree. The mixture of gold and honey is then removed from the stone and put into a basin of water, whereby the honey is melted, and the gold freed from it; and the basin is allowed to stand at rest until the gold subsides. When it has done so, the water is poured off, and fresh quantities are added, until the honey be entirely washed away; after which the gold is put in paper, and dried for use. This is the true gold powder; besides which, there is another, called German gold, in common use; and also a third, called aurum mosaicum, or musivum greatly employed in bronzing, and which is thus prepared. A pound of tin, seven ounces of flour of sulphur, half a pound of purified quicksilver, and the same quantity of sal ammoniac, are taken as the necessary ingredients. The tin being melted in a crucible, the quicksilver is added to it; and, when this mixture is cold, it is reduced to powder, and ground with the sal ammoniac and sulphur, until the whole They are then to be heated in a be thoroughly mixed. matrass, and the sublimation of the other ingredients will leave the tin converted into the aurum mosaicum, which is found at the bottom of the glass like a mass of bright flaky gold powder. The substance sublimed is chiefly vermilion, and is carefully collected. Should any black or discoloured particles appear, they must be removed. The sal ammoniac used must be very clean, and the mercury pure. These colours are commonly employed in bronzing; but when a shade more of a red, resembling copper, is required, it can easily be obtained by grinding a very small quantity of red lead along with them. Copper powder may be procured by dissolving filings or slips of that metal with nitrous acid in a receiver. When the acid is saturated the slips are to be removed; or, if filings be employed, the solution is to be poured off from what remains undissolved. Small iron bars are then put in, which will precipitate the copper from the saturated acid, in a powder of the peculiar appearance and colour of copper; and the liquid being poured from the powder, this is to be washed clean off the crystals by repeated levigations. In addition to these compounds, we may name gold size, which is of particular use in bronzing and several other branches of the arts. This is prepared from a pound of linseed oil, with four ounces of gum animi. The latter is gradually supplied in powder to the oil, while boiling; and it is necessary that it should be stirred with every successive dose, until the whole be dissolved and incorporated with the oil. The mixture is still allowed to continue boiling, until a small quantity, when taken out, appears of a thicker consistence than tar; and the whole is then strained through a coarse cloth, and put aside. When used, it must be ground with as much vermilion as will render it opaque, and, at the same time, diluted with such a quantity of oil of turpentine as will bring it to a proper consistence for working freely with the brush.

In regard to the operation of bronzing itself, if a cement Bronzing. is to be used, the powders now described may be mixed with strong gum water or isinglass, and laid on the subject with a brush or pencil; in doing which, some artists recommend beginning at the bottom and proceeding upwards. By a different process, gold size, prepared with a due proportion of turpentine, may be taken, and the subject covered with it. This is allowed to dry very nearly, but while still preserving a certain clamminess, a piece of soft leather wrapped round the finger is dipped in the powder, and rubbed over the work; or, what is judged preferable, it may be spread with a soft camel-hair pencil. The whole, now covered, must be left to dry, and the loose powder then cleared away by a hair pencil also. Here the principal nicety consists in ascertaining the proper period of dryness for applying the powder, as much of the effect depends on it. But this method of bronzing is esteemed better, because the gold size binds the powders to the ground, without any hazard of their scaling or rubbing off, which sometimes happens when gum or isinglass is employed. The precise tint of bronzing is regulated by taste; and, indeed, a very perceptible difference appears both in ancient and modern statues, resulting either from age or the metallic proportions.

Bronzing on wood may be effected by a particular process, somewhat varying from the general rules. Prussian blue, patent yellow, raw umber, lamp-black, and pipe-clay, are ground separately with water, on a stone, and as much of them as will make a good colour put into a small vessel three-fourths full of size, not quite so strong as what is called clean size in gilding. This mixture is found to succeed best on using about half as much more pipe-clay as of the rest; but this depends on taste and fancy in preferring a peculiar tint. The wood, which has been previously cleaned, smoothed, and coated with a mixture of clean size and lamp-black, receives a new coating with the preceding ingredients, twice successively, the first being allowed to dry: afterwards the bronze-powder is to be laid on with a pencil, and the whole burnished or cleaned anew, observing to repair the parts which may be injured by this operation. Next, the work must be coated over with a thin lather of Castile soap, which will take off the glare of the burnishing, and afterwards carefully rubbed with a woollen cloth. The unseemly appearance of the cavities is removed by slightly wetting them with a camel-hair pencil dipped in the lather, and then sprinkling them with a little dust of verditer. The superfluous powder may be rubbed off when dry.

In bronzing iron, the subject should be heated to a greater degree than the hand can bear, and German gold, mixed with a small quantity of spirit of wine varnish, spread over it with a pencil. Should the iron be already polished. it is necessary to heat it well and moisten it with a linen rag wet in vinegar, on purpose to obscure the polish, that the bronze powder may be sufficiently incorporated with the surface. There are other methods of accomplishing the same object, as by employing some coloured mordant, when the iron is not to be exposed to heat, and spreading the bronze over the mordant, when half dry, with a pencil. The bronzing of gun-barrels may be effected in various ways, as for example the following: -- Moisten the surface with dilute muriatic or nitric acid, in order that it may acquire a brown rust; or apply for this purpose the butter or chloride of antimony. This is to be mixed with olive oil, and rubbed on the barrel, which should be slightly heated. Then expose the piece to the air, and rub it with aquafortis to hasten the operation. The barrel is next to be well cleaned and washed with water, dried, and finally polished, either with a steel burnisher, or rubbed with wax, or varnished with a very weak solution of shell-lac in spirit of wine. (Ure's Dict. of Arts, &c.)

There is a method of silvering casts of plaster of Paris, and other substances, which is also called bronzing, and

Brookes.

Bronzino conducted after the manner above described for plaster bronzing; but it is not in general repute.

Conjectures have been entertained, that artists originally resorted to bronzing solely for the purpose of correcting the glare of colours; but this is exceedingly improbable; and it is certainly unnecessary to seek farther than the inducement of easily imitating metallic figures, so greatly esteemed

by persons of taste.

BRONZINO, Angiolo, a Florentine painter, born in 1502. This artist was, like his friend Vasari, a follower of the school of Buonarotti. His historical fresco pictures in the Palazze Vecchio at Florence, and some of his altar-pieces, are graceful and spirited; but some of the latter are in a feeble style. His portraits are in many Italian collections, and are praiseworthy for truth and expression; but the flesh tints are often too leaden, or too raw, from the want of that gradation of middle tints that give harmony to a picture. He died about 1571.

BROOKBANK, JOSEPH, an English divine, born at Halifax in Yorkshire, in 1612. After graduating at Oxford, he removed to London, where he established a school, for the use of which he published an abbreviation of Lilly's Grammar. Though he distinguished himself during the time of the Commonwealth by his loyalty, he was not fortunate enough to be rewarded with any church preferment at the Restoration. His works have little interest for mo-

dern readers, and are now wholly forgotten.

BROOKE, Frances, a clever novelist and dramatic writer, whose maiden name was Moore, was born in the earlier part of the eighteenth century. Of her novels, some of which enjoyed considerable popularity in their day, we may specify The History of Lady Julia Mandeville, Emily Montague, and The Excursion. Her dramatic pieces and translations from the French are now wholly forgotten. She died in January 1789, two days after her husband.

BROOKE, Henry, an amiable and accomplished writer, born at Rantavan in Ireland, 1706. After studying at Trinity College, Dublin, at an early age he entered the Temple, and soon became the intimate friend of Pope and Swift. Encouraged by Lords Lyttleton and Chatham, he published a tragedy entitled Gustavus Vasa, which had a rapid sale, and amply recompensed the author. Mr Brooke was also the author of the Fool of Quality, Juliet Grenville, Universal Beauty, and other poems. The death of this estimable and benevolent man took place at Dublin, Oct. 10, 1785.

BROOKES, Bartholomaus Heinrich, a learned and amiable German poet and lawyer, was born at Lubeck in 1680. On leaving college he settled at Hamburg, where he practised as a lawyer with such distinguished success, that he was made a senator, and afterwards an aulic counsellor, with the title of Count Palatine. After a useful and laborious life he died in 1747. His most ambitious work is his Earthly Contentment in God, a collection of moral poems still highly esteemed in Germany. His translations from foreign poets are very numerous. Among these may be specified his version of Pope's Essay on Man, and his translations from Marini and other Italian poets.

Brookes, Joshua, a celebrated English anatomist, was born in 1761. At a very early age he devoted himself to medical science, and attended the lectures of the most eminent surgeons in London and Paris. As soon as he had completed his studies, he began to teach anatomy and physiology, and continued to do so during forty years of his life, training no fewer than 5000 students, many of whom afterwards became famous in different parts of the world. His museum, which contained specimens not only of human and comparative anatomy, but also of natural history in all its branches, was arranged on a system combined from the various methods of Cuvier, Blumenbach, Linnæus, and other naturalists, and cost its proprietor about L.30,000.

Many of his treatises are printed in the Transactions of Brooklyn the various scientific societies of which he was a member. He died suddenly at London, Jan. 10, 1833.

Broome.

BROOKLYN, a city, capital of King's County, in the State of New York, North America, stands at the western end of Long Island, immediately opposite New York, from which it is separated by the East river, an arm of the sea about three-quarters of a mile in breadth. The ground on which the city is built exhibits considerable inequalities of surface, which gives it a very picturesque appearance. It is regularly laid out, the streets generally straight, from 60 to 100 feet wide, and crossing each other at right angles. It has numerous handsome and elegant public buildings, among which are the city-hall, a fine marble structure of recent erection; the jail, lyceum, city library, naval hospital, &c. It has 63 churches, of which 11 are Episcopal, 7 Roman Catholic, 6 Baptist, 6 Reformed German, 5 Congregational, 7 Presbyterian, 11 Methodist Episcopal, &c. It contains 13 school districts, under the superintendence of the Board of Education. Each of these has a valuable library

free to the inhabitants of the district, as are likewise the public schools to the children. Academies and high schools are also numerous. The Greenwood cemetery is one of the most picturesque and beautiful places of the kind, and covers an area of nearly 300 acres. It has some fine avenues and ornamental ponds, and contains numerous monuments. The trade of Brooklyn is very considerable; but being included in the district of New York, no separate returns are made. The dock covers 42½ acres, has a pier 3000 feet in length, and is accessible to vessels of the largest size. The United States navy yard on Wallabout bay covers 40 acres; and an immense dry dock, the greatest work of the kind in the United

New York enables many of the merchants of that city to reside here. Brooklyn obtained its charter as a city in 1834, and is divided into 11 wards, governed by a mayor and common council. Pop. (1820) 7175; (1830) 15,396;

States, has lately been completed there. Its proximity to

(1840) 36,233; (1850) 96,838. BROOM. See BOTANY.

Broom-Flower gives the denomination to an order of knights instituted by St Louis of France on his marriage. The motto was Exaltat humiles, and the collar was made up of broom flowers and husks, enamelled and intermixed with fleurs de lis of gold, set in open lozenges, enamelled white, chained together; to which was suspended a cross florence of gold. This answers to what the French called Ordre de la Géneste, from the name of a species of broom.

BROOME, WILLIAM, the coadjutor of Pope in translating the Odyssey, was born in Cheshire, of humble parents. He was educated upon the foundation at Eton, and was captain of the school a whole year, without any vacancy occurring by which he might have obtained a scholarship at King's College. Being by this delay superannuated, he was sent to St John's College by the contributions of his friends, and obtained a small exhibition there. His fondness for metrical composition was then such that his companions familiarly called him Poet. He appeared early in the world as a translator of the Iliad into prose, in conjunction with Ozell and Oldisworth. How their several parts were distributed is not known. This is the translation of which Ozell boasted as superior, in Toland's opinion, to that of Pope. He was introduced to Pope, who was then visiting Sir John Cotton at Madingley, near Cambridge, and gained so much of his esteem that he was employed to make extracts from Eustathius for the notes to the translation of the Iliad; and in the volumes of poetry published by Lintot, commonly called Pope's Miscellanies, many of his early pieces were inserted.

When the success of the Iliad gave encouragement to a version of the Odyssey, Pope, weary of the toil, called Fenton and Broome to his assistance; and taking only

Brosses.

Brooming half the work upon himself, divided the other half between his partners, giving four books to Fenton and eight to Broome. To the lot of Broome fell the second, sixth, eighth, eleventh, twelfth, sixteenth, eighteenth, and twentythird, together with the burden of writing all the notes. The price at which Pope purchased this assistance was L.300 paid to Fenton and L.500 to Broome, with as many copies as he wanted for his friends, which amounted to L.100 more. The payment made to Fenton is known only by hearsay; Broome's is very distinctly told by Pope in the notes to the Dunciad. It is evident that, according to Pope's own estimate, Broome was unfairly treated. If four books could merit L.300, eight, and all the notes, equivalent at least to four more, had certainly a right to more than L.600. Broome probably considered himself as injured; for he always spoke of Pope as too much a lover of money, and Pope pursued him with avowed hostility. He not only named Broome disrespectfully in the Dunciad, but quoted him more than once in the Bathos, as a proficient in the art of sinking. It has been said that they were afterwards reconciled; but their peace was probably without friendship. Broome afterwards published a Miscellany of Poems. He never rose to very high dignity in the church: he became rector of Sturston in Suffolk, where he married a wealthy widow; and afterwards, when the king visited Cambridge, in 1728, he was made doctor of laws. Towards the close of his life he amused himself with translating some of the Odes of Anacreon, which he published in the Gentleman's Magazine under the name of Chester. He died at Bath in 1745.

BROOMING of a ship. See Breaming.

BROSE, a Scotch dish made by pouring boiling water on oatmeal, with the addition of salt, and sometimes butter or milk. It is also prepared in various other ways.

BROSELEY, a market-town on the Severn, in the county of Salop, 146 miles from London. It is a place of considerable trade in iron, having near it productive mines of that mineral, as well as of coal. Market-day Wednesday. Pop. of parish (1851) 4739.

BROSSARD, SEBASTIEN DE, an eminent French musician, born A.D. 1660. In early life he had been prebendary and chapel-master of the cathedral church of Strasburg: he afterwards became grand chaplain and maître de chapelle in the cathedral of Meaux. He wrote a work entitled Prodromus Musicalis, 2 vols. folio; and was also the author of Dictionnaire de Musique, first printed at Amsterdam, in folio, 1703. At the end of this useful book there is a catalogue of authors ancient and modern, to the number of nine hundred, who have written on music. It is also interspersed with many curious observations on the history of music. His own compositions were chiefly sacred music. He died August 10, 1730.

BROSSES, CHARLES DE, first president of the parliament of Burgundy, was born at Dijon in 1709. He studied law with a view to the magistracy, but the bent of his mind was towards literature and the sciences. He travelled through Italy in 1739, in company with his friend M. de Sainte-Palaye; and on his return to France published his Lettres sur l'Etat Actuel de la Ville Souterraine d'Herculaneum, Dijon, 1750, 8vo, which was the first work upon that interesting subject. A collection of letters, written during his Italian tour, entitled Lettres Historiques et Critiques, in three vols. 8vo, was published at Paris after his death. In 1760 he published a dissertation Sur le Culte des Dieux Fétiches, 12mo, which was afterwards inserted in the Encyclopédie Méthodique. At the solicitation of his friend Buffon, De Brosses undertook his Histoire des Navigations aux Terres Australes, which was published in 1756, in two vols. 4to, with maps. It was in this work that De Brosses first laid down the geographical divisions of Australasia and Polynesia, which were afterwards adopted by Pinkerton and succeeding geographers. In 1765 ap-

peared his Traité de la Formation Mécanique des Lan- Brother. gues; a work distinguished by much research, and containing many ingenious hypotheses; but, at the same time, marked by that love of theory which is so apt to imbue the cultivators of etymological science.

De Brosses had been occupied, during a great part of his life, on a translation of Sallust, and in attempting to supply the lost chapters in that celebrated historian. At length, in 1777, he published L'Histoire du Septième Siècle de la République Romaine, 3 vols. 4to; to which is prefixed a learned life of Sallust, reprinted at the commencement of the translation of that historian by De Lamalle.

These literary occupations did not prevent De Brosses from discharging with ability his official duties, nor from carrying on a constant and extensive correspondence with the most distinguished literary characters of his time. In 1758 he succeeded the Marquis de Caumont in the Académie de Belles Lettres; but was never admitted a member of the French Academy, in consequence, it is said, of the opposition of Voltaire.

Besides the works already mentioned, he wrote several memoirs and dissertations in the collections of the Academy of Inscriptions, and in those of the Academy of Dijon. He also contributed various articles to the Dictionnaire Encyclopédique, on the subjects of grammar, etymology, music, &c.; and he left behind him several MSS. which were unfortunately lost during the revolution. He died in 1777. (Biographie Universelle.)

BROTHER (in Greek ἀδελφός, in Latin frater), a term of relation between two male children, sprung from the same father, or mother, or both. Scaliger and Vossius derive frater from φρατηρ, for φρατωρ, which properly signifies a person who draws water in the same well. The word, it is said, came originally from the city Argos, where there were only a few φρέατα or wells distributed in certain quarters of the city, to which those of the same neighbourhood

By the civil law, brothers and sisters stand in the second degree of consanguinity; by the canon law, in the first degree. By the Mosaic law the brother of a man who died without issue was enjoined to marry the widow of the deceased. Deuter xxv. 5. The ancients frequently applied the term brother indifferently to almost all who stood related in the collateral line, as uncles and nephews, cousins german, and the like. This we learn not only from a great many passages in the Old Testament, but also from profane authors. Cicero, in his Philippics, calls Antonia both wife and sister of Mark Antony, because she was daughter of his brother C. Antonius. And as to cousins, Tullus Hostilius, in Dionysius Halicarnasseus, calls the Horatii and Curiatii brothers, because they were sisters' children. The language of the Jews included in the name of brethren not only the strict relation of fraternity, but also the larger one of consanguinity. "We be brethren," said Abraham to Lot, (Gen. xiii. 8,) whereas Lot was only his nephew. So Jacob told Rachel that he was her father's brother (Gcn. xxix. 12), whereas he was only his nephew. It is customary for kings to give to each other the title of brother. Nor is the custom modern. Menander mentions a letter of Chosroes king of Persia to the emperor Justinian, beginning thus: "Chosroes, king of kings, to the emperor Justinian my brother." In the civil law, brothers, fratres, in the plural, sometimes comprehends sisters; as Lucius et Titia, fratres; tres fratres, Titius, Mævius, et Seia.

Foster-Brothers, are males nursed at the same breast; more strictly used of those suckled at the same time with the nurse's own child. The French call them frères du lait, or brothers by milk.

Brother was also used by writers of the middle ages for a comes, or governor of a province. It is sometimes used to denote a person of the same profession; and is also a

Brouk.

husius

Broussa.

Brothers customary term by which priests of the same persuasion address one another. Preachers, too, address their hearers as my brethren. This appellation is borrowed from the pri-Broughton, mitive Christians, who all called each other brothers. Brother is likewise an appellation more peculiarly given to certain orders of religious. In the military orders the knights are also called brothers: and in the order of Malta there was a particular class who are called serving brothers (fratres clientes), consisting of such as cannot give proof of their nobility. Brothers of the Rosy Cross. See Rosicrucians.

BROTIER, GABRIEL, was born at Tannay in 1723, and was brought up a Jesuit. On the suppression of the order he devoted himself entirely to literature. He is best known by his edition of Tacitus, which appeared at Paris in 1771, 4 vols. 4to. He also edited Pliny, in 6 vols. 12mo, 1779; and Phædrus, in 1783. His revised edition of Amyot's translation of Plutarch appeared in 22 vols. 1783. This eminent scholar died at Paris, in February 1789.

BROUGH, a market-town in the east ward of the county of Westmoreland, 271 miles from London. It occupies the site of the Verterac of the Romans, and consists of a long street, divided by a brook which runs into the Eden. The church is a spacious ancient building, with a pulpit formed out of one entire stone. The ruins of the castle, which stands upon a lofty eminence, constitute its most interesting feature. Market-day Thursday. Pop. (1851) 773.

BROUGHTON, HUGH, a learned scholar and divine, was born at Oldbury in Shropshire, in 1549. After receiving the rudiments of his education at a provincial school, he went to Cambridge, where in due time he was chosen a fellow of Christ's College, and took orders in the church. During his career at the university, he laid the foundation of the Hebrew scholarship, for which he was afterwards so distinguished. From Cambridge he went to London, where his eloquence gained him many and powerful friends. In 1588 he published his first work, "a little book of great pains," entitled the Consent of Scriptures. This work was strongly opposed at both the great universities, and the author was obliged to defend it, which he did in a series of lectures. In 1589 he went to Germany, where he frequently engaged in discussions, both with papists and with the learned Jews whom he met at Frankfort and elsewhere. In 1591 he returned to England, and published an "Explication of the article of Christ's descent into Hell," which like his last treatise elicited a violent opposition. In 1592 he once more went abroad, and cultivated the acquaintance of the principal scholars of the different countries through which he passed. Such was the esteem in which he was held even by his papist opponents, that he was offered a cardinal's hat if he would renounce the protestant faith; which, however, he declined to do. On the accession of James he returned to England; but not being engaged to co-operate in the new translation of the Bible then begun, he retired to Middleburgh in Holland, where he preached to the English congregation. In 1611 he returned to England, where he died in the following year. Some of his works were collected and published in a large folio volume in 1662, but many of his theological MSS. remain still unedited in the British Museum.

Broughton, Thomas, a learned divine, and one of the original writers in the Biographia Britannica, was born at London, July 5. 1704. At an early age he was sent to Eton, where he soon distinguished himself by his acuteness and studious disposition. Being superannuated on this foundation, he removed about 1722 to the university of Cambridge; and, for the sake of a scholarship, entered himself of Caius College. Here two of the principal objects of his attention were the acquisition of the modern languages, and the study of mathematics, under the famous Professor Sanderson. In May 1727, Broughton, after graduating as B.A., was admitted to deacon's orders, and in

the succeeding year was ordained priest, and took the degree of M.A. He then removed from the university to the curacy of Offley in Hertfordshire. In 1739 he was instituted to the rectory of Stepington, or Stibington, in the county of Huntingdon. He was soon after chosen reader to the Temple, by which means he became known to Bishop Sherlock, then Master, who conceived so high an opinion of Broughton's merit, that in 1744 he presented him to the valuable vicarage of Bedminster, near Bristol. together with the chapels of St Mary Redcliff, St Thomas, and Abbot's Leigh annexed. He was afterwards collated by the same patron to the prebend of Bedminster and Red-cliff, in the cathedral of Salisbury. Upon receiving this preferment he removed from London to Bristol, where he married the daughter of Thomas Harris, clerk of that city, by whom he had seven children. He died December 21, 1774.

For many years of his life, Broughton was engaged in a variety of publications, of which a list is given in the Biographia Britannica, 2d edition. He was a great admirer of ancient music, and furnished Handel with words for many of his compositions. He was distinguished by an active zeal for the Christian cause; and in private life was devoted to the interests and happiness of his family, and possessed a mild, cheerful, and liberal temper. In 1778 a posthumous volume of sermons, on select subjects, was published by his son, the Rev. Thomas Broughton, M.A.

BROUKHUSIUS, or Broekhuizen, Jan, a distinguished scholar, born in 1649 at Amsterdam, where his father was a clerk in the Admiralty. His father dying when he was very young, he was taken from literary pursuits, in which he had made extraordinary progress, and placed with an apothecary at Amsterdam, with whom he lived several years. But not liking the pestle and mortar, he went into the army, where he rose to the rank of lieutenantcaptain; and in 1674 he was sent with his regiment to America, in the fleet under Admiral de Ruyter, but returned to Holland the same year. In 1678 he was sent to the garrison at Utrecht, where he contracted a friendship with the celebrated Grævius; and here he had the misfortune to be so deeply implicated in a duel, that, according to the laws of Holland, his life was forfeited; but Grævius wrote immediately to Nicholas Heinsius, who obtained his pardon from the stadtholder. Not long afterwards he became a captain of one of the companies then at Amsterdam; and was thus enabled to pursue his studies at his leisure. His company being disbanded in 1697, he received a pension, upon which he retired to a country-house near Amsterdam. He died in 1707, aged fifty-eight.

As a classical scholar, he is distinguished by his editions of Propertius and Tibullus, the former published in 1702, the latter in 1708. His Carmina were published at Utrecht, 1684, in 12mo; and more splendidly by Van Hoogstraatten, Amsterdam, 1711, 4to. His Dutch poems were also published at Amsterdam, 1712, 8vo, by the same person, with a life prefixed. Broukhusius also edited the Latin works of Sannazarius and Palearius.

BROUNCKER, WILLIAM, lord viscount of Castle-Lyons, in Ireland, and the first president of the Royal Society, was the son of Sir William Brouncker, and was born about 1620. He was distinguished by his knowledge of mathematics, and enjoyed various posts of honour and profit after the Restoration; for he was at the same time chancellor to the queen, keeper of the great seal, a commissioner of the navy, and master of St Catherine's Hospital, near the Tower of London. Amongst other works he wrote Experiments on the recoiling of Guns; An algebraical paper upon the squaring of the Hyperbola; and several letters to Dr Usher, archbishop of Armagh. He died in 1684.

BROUSSA, or BRUSA, a city of Turkish Anatolia, capital of the Sanjak of Khodavendkiar, is situated in a fertile plain at the northern foot of Mount Olympus, 57 miles S.S.E.

Brown.

Broussais of Constantinople. Pop. estimated at 60,000. The houses are built of wood, and the numerous minarets give the town Broussonet, a very magnificent appearance from a distance, but the streets are narrow and dark. It is abundantly supplied with water, and has many beautiful fountains. It has a castle, numerous mosques, bazaars, khans, colleges, and several churches and synagogues. Its hot and cold mineral springs have been long celebrated. They vary in temperature up to 184° Fahr. Broussa is one of the first commercial cities of Turkey, and has also extensive manufactures of satins, silks, cottons, carpets, tapestry, &c. The celebrated Arab chief Abd-el-Kader, is now living there (1854) in retire-

> BROUSSAIS, FRANÇOIS JOSEPH VICTOR, a celebrated French physician, was born at St Malo in 1772. From his father, who was also a physician, he received his first instructions in medicine; but at an early age he entered the service of the republic, first as a private soldier and non-commissioned officer, and afterwards as a surgeon in the navy. At the end of that period he went to Paris, where in 1803 he graduated as M.D. In 1805 he again joined the army in a professional capacity, and served in Germany, Holland, Italy, and Spain. In 1814 he returned to Paris, and was appointed assistant-professor to the Military Hospital of the  ${f Val}$ -de-Grace, where he first promulgated his peculiar doctrines. His lectures were attended by great numbers of students, who received with the utmost enthusiasm the new theories which he propounded. In 1816 he published his Examen des Doctrines Médicales, which drew down upon its author the hatred of the whole medical faculty of Paris. By degrees these doctrines triumphed; and gradually crept into the writings and practice of the best physicians, and even into the medical school itself, long before their propounder held office in that institution. In 1831 he was appointed professor of general pathology in the academy of medicine, and taught with great applause till his death in 1838. Of his works, which are very numerous, the most important, besides the Examen above mentioned, are the Histoires de Phlegmasies Chroniques, Paris, 1808, 2 vols. 8vo; Traite de la Physiologie appliquée à la Pathologie; Paris, 1824; Commentaires des Propositions de Pathologie consignées dans l'Examen, Paris, 1829, 2 vols. 8vo; Le Choléra-morbus épidemique, Paris, 1832, 8vo, &c., &c.

BROUSSONET, PIERRE MARIE AUGUSTE, a distinguished French naturalist, was the son of a schoolmaster, and was born at Montpellier in 1761. He was educated at Montpellier for the medical profession; and such was the estimation of his abilities in the university, that when only eighteen years of age he was appointed to fill a professor's chair. So great, indeed, was his reputation, that a few years afterwards he was admitted a member of the Academy of Sciences by a unanimous vote, a circumstance till that time without example in the annals of that learned body. Botany seems to have been the science to which he was at first chiefly devoted; and he laboured with much zeal to establish the system of Linnæus in France. With this view, as well as for his own improvement, he went to Paris, and visited the various museums and collections. He next came to England, and was admitted in 1782 an honorary member of the Royal Society. It was at this period that he published at London his work on fishes, describing the most rare species, under the title of Ichthyologia, seu Piscium Descriptiones et Icones. On his return to Paris he was appointed perpetual secretary to the Society of Agriculture, an office which the intendant Berthier de Sauvigny resigned in

In 1789 he was nominated a member of the Electoral Colfege of Paris, an office which required him to serve as magistrate whenever his colleagues were in need of assistance in the exercise of their functions; and on the first of these occasions, as he was proceeding to the Hôtel de Ville, he had

the misfortune to see his friend and protector Berthier barbarously murdered by the populace. His own life was frequently in peril during the tumults that ensued, and when he had the charge of superintending the supply of provisions for the capital. In 1791 he had a seat in the legislative assembly; but, disgusted with politics, he quitted Paris the year following, and repaired to his native city. Persecution followed him in his retreat, and he was glad after many dangers to effect his escape to Madrid, where he was liberally assisted by the literati of that city. The malignity of the French emigrants, however, who could not pardon his having held any office under the revolutionary government, still pursued him, and drove him from Spain, and afterwards from Lisbon, where he had sought an asylum. At last he went out as physician to an embassy which the United States sent to the emperor of Morocco; and on this occasion his friend Sir Joseph Banks, informed of his distresses, remitted him L.1000. After residing for some time at Morocco, he obtained from the French directory permission to return to France; and was appointed by them consul at Teneriffe, where he resided for two years. On his return in 1797 he was chosen member of the institute, and was reinstated in his botanical professorship at Montpellier, with the direction of the botanical garden. He was afterwards elected a member of the legislative body, but died of apoplexy on the 27th July 1807. France is indebted to him for the introduction of the Merino sheep and Angola goats.

Besides the work on fishes, already noticed, the following are his principal productions: Variæ Positiones circa Respirationem, Montellier, 1788 : Essai sur l'Histoire Naturelle de quelques espèces de Moines, décrite à la manière de Linée, 8vo, 1784, which is a translation of a Latin satire on the monks, the original of which appeared in Germany in 1783: Année rurale, ou Calendrier à l'usage des Cultivateurs, 2 vols. 12mo. Paris, 1787-8: Notes pour servir à l'Histoire de l'Ecole de Médecine de Montpellier pendant l'an VI. 8vo, Montpellier, 1795. He was also a conductor, conjointly with Parmentier, Dubois, and Lefebure, of La Feuille du Cultivateur, in 8 vols. 4to, published in 1788 and the following years.

BROWN, JOHN, D.D., an English divine, and ingenious writer, born at Rothbury in Northumberland in November 1715. He was the son of John Brown, a descendant of the Browns of Colstown, near Haddington; and who at the time of his son's birth was curate to Dr Tomlinson, rector of Rothbury. He was educated at St John's, Cambridge; and after taking the degree of bachelor of arts with great reputation, being senior wrangler, he returned to his father's house at Wigton; received deacon's and priest's orders from Sir George Fleming, bishop of Carlisle; and in 1739 went to Cambridge to take his degree of master of arts. In 1745 he distinguished himself as a volunteer in the king's service, and behaved with great intrepidity at the siege of Carlisle.

The attachment displayed by Brown to the royal cause and to the whig party, procured him the friendship of Dr Osbaldeston, afterwards bishop of Carlisle. This gentleman continued to be his friend through life; a remarkable fact, since the peculiarities of Brown's temper involved him in quarrels with almost all his acquaintances. When advanced to the see of Carlisle, Dr Osbaldeston appointed Brown one of his chaplains.

It was probably during his residence at Carlisle that Mr Brown wrote his poem entitled Honour, inscribed to Lordi Viscount Lonsdale. His next poetical production was his Essay on Satire, addressed to Dr Warburton, to whom it was so acceptable, that he took Brown into his friendship. He also introduced him to Ralph Allen, Esq. of Prior Park, near Bath, who behaved to him with great generosity, and to whom in 1751 Brown dedicated his Essay on the characteristics of Lord Shaftesbury. In 1754 he was promoted by the Earl of Hardwicke to the living of Great Horksley in Essex; and in the following year took the degree of doctor of divinity at Cambridge. In this year also he published his

Brown.

tragedy of Barbarossa; which, under the management of Garrick, was acted with considerable applause, though when published it was sharply censured. This tragedy was followed by a second, entitled Athelstane, which was represented at Drury-Lane theatre. This was also well received by the public, but did not become so popular as

In 1757 appeared his well-known Estimate of the Manners and Principles of the Times, which was shortly followed by a second volume, containing additional remarks on the ruling manners and principles, and on their public effects. This was treated with uncommon severity by the periodical critics; and such was the multitude of his antagonists, that he retired for a while into the country. In his retreat he wrote an explanatory defence of the work above mentioned.

In 1760 he published an Additional Dialogue of the Dead, between Pericles and Aristides; being a sequel to Lord Lyttleton's dialogue between Pericles and Cosmo. One design of this additional dialogue was to vindicate the measures of Mr Pitt, against whose administration Lord Lyttleton had been supposed to have thrown out some hints. His next work, in 1763, was the Cure of Saul, a sacred ode; which was followed by A Dissertation on the Rise, Union, and Power, the Progressions, Separations, and Corruptions of Poetry and Music. This is one of the most pleasing of his performances, and abounds with a variety of critical discussions. In reply to various strictures on this piece, he wrote Remarks on some Observations on Dr Brown's Dissertation on Poetry and Music. In 1764 he published, in octavo, The History of the Rise and Progress of Poetry through its several Species; which is no more than the substance of the dissertation above mentioned. The same year he published a volume of sermons, dedicated to his patron Dr Osbaldeston, bishop of London; but most of these had been separately published. In the beginning of 1765 he published Thoughts on Civil Liberty, Licentiousness, and Faction; and in conclusion prescribed a code of education, upon which Dr Priestley made remarks at the end of his Essay on the Course of a liberal Education for civil and active Life. The same year he published a sermon On the Female Character and Education, preached before the guardians of the asylum for deserted female orphans. His last work, published in 1766, was a Letter to the Rev. Dr Lowth, occasioned by his late "Letter to the Right Reverend Author of the Divine Legation of Moses," in which Dr Brown is pointed at as one of the extravagant adulators of Bishop Warburton. Besides these works, Dr Brown published a poem on Liberty, and two or three anonymous pamphlets. Dr Brown, who had an hereditary tendency to insanity, and from early life had been subject at times to fits of excessive melancholy, put a period to his life on the 23d of September 1766

Brown, John, author of the Self-interpreting Bible, was born at Carpow, in Perthshire, in 1722. He was, for a great part of his life, minister of the Burgher branch of the Secession church in Haddington, and also discharged the duties of Professor of Divinity. Though he had not enjoyed the advantages of a regular education, he mastered the classical tongues, as well as several modern and oriental languages, and gained a just reputation for learning and piety. He died in 1787. The best of his works, which are very numerous, are his Self-interpreting Bible, and Dictionary of the Bible, works that are still very popular in He also wrote a valuable Body of Divinity.

Physic, was born in 1735 at Lintlaws or at Preston, Berwickshire. While very young he was apprenticed to a weaver; but having a strong aversion for the drudgery of such a mechanical employment, he was placed at the grammar-school of Dunse, where he soon distinguished himself.

His parents, who belonged to the religious body called Se- Brown. ceders, were flattered with their son's rapid and successful progress in the Latin language, and through the benevolent assistance of his teacher (Mr Cruickshank), young Brown was destined to the ministerial office. But an accident, it is said, made him at once renounce this plan and the sect. Having, while at the grammar-school, been prevailed on to attend a meeting of synod held in the Established church at Dunse, young Brown was called upon to appear before the session of his congregation, and required either to submit to ecclesiastical censure or to suffer expulsion. He spared them all trouble by renouncing their communion, and joining the Established church.

Brown then became a private tutor in a gentleman's family in the country; and at the same time acted as an assistant in the grammar-school of Dunse, where he remained till about his twentieth year. He then went to Edinburgh, and after passing through the preliminary classes, entered himself as a student of divinity in the university. He supported himself for some time by private teaching, and then resumed his former labours as assistant in the grammarschool of Dunse for a year; but returning to Edinburgh about 1759, he finally renounced the study of theology, and

commenced that of physic.

During his medical studies, he supported himself by giving private instructions in Latin to students of medicine, preparatory to the examinations, which formerly were conducted in that language; as well as by translating their theses into Latin. Thus occupied, he soon attracted the notice of Dr Cullen. This eminent man not only employed Brown as a tutor in his own family, but was assiduous in recommending him to others; and he likewise gave him permission to deliver to private pupils illustrations of his own public lectures. Brown now married, and received students to board in his house; but either through recklessness or misconduct, his affairs were soon involved in total bankruptcy. Irritated by this misfortune, and still more, perhaps, by the disappointment he experienced in regard to a medical chair in the university, from which he imagined he was excluded by the interference of Dr Cullen, he quarrelled with his friend and patron, and became from that moment a keen opponent of his doctrines.

It was in 1780 that Brown's Elementa Medicinæ appeared. It is a compendium of his opinions, which he continued for several years to illustrate by public lectures. The excitement produced by the appearance of this work, both in this country and on the Continent, seems now almost incredible; but although it has passed through numerous editions, and its doctrine is detailed in all systematic works on medicine, the Brunonian theory is now maintained by few. Mr Brown now proposed to become a medical practitioner; but as he had quarrelled with all the professors at Edinburgh, he

took the degree of M.D. at St Andrews.

The terms, however, on which he lived with his medical brethren, and his intemperate habits, precluded him from all rational hopes of success, and he therefore removed to London in 1786; but after he had delivered one course of lectures he was cut off by apoplexy in October 1788.

Brown, Robert, a schismatic divine, the founder of the Brownists, a numerous sect of dissenters in the reign of Queen Elizabeth. He was the son of Mr Anthony Brown of Tolthorp in Rutlandshire, whose father obtained, by a charter of Henry VIII., the singular privilege of wearing his cap in the king's presence. Robert was educated at Cambridge, in Corpus Christi, or, according to Collier, at Brown, John, the founder of the Brunonian Theory of Bennet College, and was afterwards a schoolmaster in Southwark. About the year 1580 he began to promulgate his principles of dissent from the Established church; and the following year he preached at Norwich, where he soon attracted a numerous congregation. His violent abuse of the Church of England, and his pretensions to divine in-

683

Brown.

Brown. spiration, gained for him many followers among the ignorant and unwary. His sect daily increasing, Dr Freake bishop of Norwich, with other ecclesiastical commissioners, called him before them. Being insolent to the court, he was committed to the custody of the sheriff's officer, but was released at the intercession of his relative the lord treasurer Burghley. Brown now left the kingdom, and with permission of the States, settled at Middleburg in Zealand, where he formed a church after his own plan, and preached without molestation. In 1585 he returned to England; and at last fixed his residence at Northampton, where, for his indiscreet attempts to gain proselytes, he was cited by the Bishop of Peterborough, and, refusing to appear, was finally excommunicated for contempt. The solemnity of this censure, we are told, immediately effected his reformation. He moved for absolution, which he obtained, and from that time became a dutiful member of the Church of England. This happened about the year 1590; and, in a short time afterwards, Brown was preferred to a rectory in Northamptonshire, where he kept a curate to his duty, and where he might probably have died in peace; but having some dispute with the constable of his parish, he proceeded to blows, and was afterwards so insolent to the justice, that he was committed to Northampton jail, where he died in 1630, aged eighty. Brown boasted on his death-bed that he had been confined in thirty-two different prisons. He wrote a "Treatise of Reformation without tarrying for any;" and two other pieces; making together a thin quarto, published at Middleburg, 1582. See Brownists.

Brown, Thomas, of facetious memory, as he is styled by Addison, was the son of a farmer at Shiffnal in Shropshire, and was entered of Christ-church College, Oxford, whence he soon was obliged to abscond on account of the irregularities of his life. He afterwards went to London, where e had recourse to the usual refuge of half-starved wits, scribbling for bread. He published a great variety of poems, letters, dialogues, &c., full of humour and erudition, but coarse and indelicate. Though a good-natured man, he had one pernicious quality, which was—rather to lose his friend than his joke.

Towards the end of his life, as we are informed by Jacob, Brown was invited by the Earl of Dorset to a Christmas dinner along with Dryden and several other wits; on which occasion, to his agreeable surprise, he found a L.50 banknote under his plate, and Dryden at the same time received one of L 100. Brown died in 1704, and was interred in the cloister of Westminster Abbey. His works were published in 1707, in 4 vols. 12mo.

Brown, Thomas, an eminent metaphysician, was born at Kirkmabreck, in the stewartry of Kirkcudbright, on the 9th of January 1778, and was the youngest son of the Rev. Samuel Brown, minister of the parish of Kirkmabreck, and of Mary Smith, daughter of John Smith, Esq. of Wigton. His father survived his birth only a short time, and he received the first rudiments of his education from his mother. In the first lesson he learned all the letters of the alphabet, and every succeeding step was equally remarkable. From his seventh till his fourteenth year he was placed, under the protection of a maternal uncle, at different schools in the neighbourhood of London, at all of which he distinguished himself, and made great progress in classical literature. Upon the death of his uncle in 1792, he returned to his mother's house in Edinburgh, and entered as a student in the university.

His attention was first directed to metaphysical subjects by the elegant and benevolent biographer of Burns, Dr Currie of Liverpool, to whom he was introduced in the summer of 1793. About that time the first volume of Mr Stewart's Elements of the Philosophy of the Human Mind was published. Dr Currie put a copy of the work into his hands, and was struck not more with the warmth of admi-

ration which the young philosopher expressed, than with the acuteness he displayed in many of his remarks. The next winter he attended Mr Stewart's class; and at the close of one of the lectures of that celebrated philosopher, he went up, though personally unknown, and modestly submitted some difficulties which had occurred to him respecting one of Mr Stewart's theories. Mr Stewart listened to him patiently, and, with a candour which did him infinite honour, informed him that he had just received a communication from the distinguished M. Prevost of Geneva, containing a similar objection. This proved the commencement of a friendship which Dr Brown continued to enjoy till the time of his death.

It has already been mentioned in one of the preliminary dissertations to this work (p. 411, vol. i.), that at the age of nineteen he took a part with others (some of whom became the most memorable men of their time), in the foundation of a private society in Edinburgh under the name of the Academy of Physics. This society is interesting in the history of letters, as having given rise to the publication of the Edinburgh Review. Some articles in the early numbers of that work were written by Dr Brown, and bear the marks of his genius.

In 1798 he published Observations on the Zoonomia of Dr Darwin. When it is considered that the greater part of this work was written in his eighteenth year, it may perhaps be regarded as the most remarkable of his productions; and it may be doubted if, in the history of philosophy, there is to be found any work exhibiting an equal prematurity of talents and attainments. Those who take an interest in tracing the progress of intellect will find in it the germ of all his subsequent views in regard to mind, and of those principles of philosophizing by which he was guided in his future inquiries.

In 1803, after attending the usual course pursued by medical students, he took his degree of doctor of medicine.

In the same year he brought out the first edition of his poems, in two volumes. The greater number of the pieces contained in them were written while he was at college. They are of a very miscellaneous description, and are certainly inferior to many of his subsequent compositions; at the same time they all exhibit marks of an original mind, and of a singularly refined taste.

His next publication was an examination of the principles of Mr Hume respecting causation. Though this tract was occasioned by a local controversy, it is entirely of an abstract nature, and all reference to the circumstances that led to the publication is studiously avoided. Its great merits have been universally acknowledged. It was alluded to in the most flattering manner in the Edinburgh Review, in a very able article by Mr Horner; Mr Stewart also gave a valuable testimony as to its excellence; and Sir James Mackintosh has pronounced it the finest model in mental philosophy since Berkeley and Hume. A second edition, considerably enlarged, was published in 1806; and in 1818 it appeared in a third edition, with so many additions and alterations, as to constitute it almost a new work, under the title of An Inquiry into the Relation of Cause and Effect.

From the time when Dr Brown had taken his degree, he continued for several years to practise as a physician in Edinburgh. In 1806 he was associated in partnership with the late Dr Gregory; and there was every prospect of his attaining in due time the highest eminence in his profession. But success as a physician was not sufficient to satisfy his ambition. The discharge of his professional duties was marked by that assiduous tenderness of attention which might have been expected from a disposition so truly amiable; but still philosophy was his passion, from which he felt it as a misfortune that his duty should so much estrange

The period, however, at last arrived when he was to be elevated to a situation suited to his tastes and habits, and where his public duties corresponded with his inclinations. Mr Stewart, in consequence of the gradual decline of his health, being frequently prevented from attending to the duties of his class, found it necessary to have recourse to the assistance of some of his friends during his temporary absence. He therefore applied to Dr Brown, who undertook the arduous task of supplying his place with lectures of his own composition. He first appeared in the moral philosophy class in the winter of 1808-9. At this time, however, there was no great call for his exertions, as Mr Stewart was soon able to resume his professional duties. In the following winter he again presented himself as Mr Stewart's substitute, and by a succession of eloquent lectures during several weeks, he so decidedly established his character, that when Mr Stewart signified a desire to have Dr Brown united with him in the professorship, but little opposition was made, and in 1810 he was appointed professor of moral philosophy in conjunction with Mr Stewart.

Immediately after his appointment he retired to the country, where he remained till within a few weeks of the meeting of the college; judging that, with a constitution not naturally strong, nothing was so important for his approaching labours as a confirmed state of health and spirits. For many years he had devoted his attention to the science of mind, and was intimately acquainted with the subject; and, from the experience of the two preceding winters, he had acquired sufficient confidence in his own powers to be assured that he could prepare his lectures upon the spur of the occasion. Accordingly, when the college opened, except the lectures that were written during Mr Stewart's absence, he had no other preparation in writing. His exertions during the whole of the winter were very great, and completely successful. The expectations that had been excited among his friends were more than realized, and he secured the highest place in the respect and affections of his students.

For some years after his appointment to the moral philosophy chair, Dr Brown had little leisure for engaging in any literary undertaking. Even the long summer vacation he found to be no more than sufficient for restoring his energies for the exertions of the succeeding season. By degrees, however, he became familiarized with the duties of his situation, and was enabled to indulge occasionally in other pursuits. In the summer of 1814 he brought to a conclusion his Paradise of Coquettes which he published anonymously, and which met with a favourable reception. In succeeding seasons he published various other poetical works.

Any notice of the life of Dr Brown would be incomplete if it did not contain a reference to his mother, whom he loved with a tenderness and reverence of affection that formed a distinguishing feature of his character. This excellent woman died in 1817. Her character is faithfully delineated in the beautiful lines addressed to her memory, prefixed to one of his poetical productions.

In the autumn of 1819, at a favourite retreat in the neighbourhood of Dunkeld, he commenced his text-book, a work which he long intended to prepare for the benefit of his students. At that time he was in excellent health; but towards the end of December of the same year he became indisposed, and after the recess he was in such a state of weakness as to be unable for some time to resume his official duties. When he again met his class, his lecture unfortunately happened to be one which he was never able to deliver without being much moved, and from the manner in which he recited the very affecting lines from Beattie's Hermit, it was conceived by many that the emotion he displayed arose from a foreboding of his own approaching dissolution.

'Tis night, and the landscape is lovely no more,-I mourn, but, ye woodlands, I mourn not for you, For morn is approaching your charms to restore, Perfumed with fresh fragrance, and glittering with dew; Nor yet for the ravage of winter I mourn, Kind Nature the embryo blossom shall save; But when shall spring visit the mouldering urn, O when will it dawn on the night of the grave?

Brown

This was the last lecture he ever delivered. From this period his health rapidly declined. Having upon a former occasion derived great benefit from a sea voyage, he proceeded, by the advice of his medical attendants, to London, accompanied by his two sisters, with the intention of removing, as soon as the season allowed, to a milder climate. But all means of remedy were now too late, and nothing could permanently retard the progress of his disease. Day after day he became weaker.

During the whole period of his illness he was never heard to utter a complaint. Gentle as he ever was, sickness and pain made him still more so. His only anxiety seemed to be the distress which his sufferings occasioned to those around him. A few days after his arrival in London he went to Brompton, where he died on the 2d of April 1820. His remains were put into a leaden coffin, and laid, according to his own request, in the churchyard of his native parish, beside those of his father and mother.

Dr Brown was in height rather above the middle size. The expression of his countenance was that of calm reflection. His likeness is well preserved in a picture by Watson in 1806. Among the more prominent features of Dr Brown's character may be enumerated the most perfect gentleness, and kindness, and delicacy of mind, united with great independence of spirit, a truly British love of liberty, and a most ardent desire for the diffusion of knowledge, and virtue, and happiness among mankind. All his habits were simple, temperate, studious, and domestic; and he was remarkable for nothing more than his love of home, and the happiness he shed around him there.

As a philosopher he was possessed in an eminent degree of that comprehensive energy which, according to his own description, "sees, through a long train of thought, a distant conclusion, and separating at every stage the essential from the accessory circumstances, and gathering and combining analogies as it proceeds, arrives at length at a system of harmonious truth." The predominating quality of his intellectual character was unquestionably the power of analysis, in which he had few equals. In all his prose Dr Brown has shown great powers of eloquence. His poetry has never been popular, though it contains many passages of exquisite beauty. As a writer, simplicity is the quality in which he is most deficient, and subtilty that in which he most excels.

His character as a philosopher will chiefly rest upon his lectures, which were published after his death. It would be foreign to the object of the present sketch to give an account of the principles of his philosophy, or to enter upon a discussion of any of the questions that have been agitated upon the subject. We shall merely observe that the estimation in which his lectures are held by the public appears from the number of editions which, under all the disadvantages of a posthumous publication, have been called for; and his virtues as a man are almost universally allowed to have been in beautiful accordance with his talents as a philosopher.

An account of the life and writings of Dr Brown was published in 1825, in 8vo, by the Rev. Dr Welsh.

Brown, Ulysses Maximilian, a celebrated general in the imperial armies, son of Ulysses, Baron Brown and Camus, colonel of cuirassiers in the emperor's service, was descended of an ancient Irish family, and was born at Basle in 1705. After studying at Limerick in Ireland, he was sent for into Hungary by his uncle, Count George Brown, who was a

Brown. colonel of infantry. He was present at the battle of Belgrade in 1717; and he afterwards continued his studies in the Clementine College at Rome till 1721, when he went to Prague to study the civil law. At the end of 1723 he became captain in his uncle's regiment, and in 1725 lieutenantcolonel. In 1730 he served in Corsica, and contributed greatly to the taking of Callansara. In 1732 the emperor made him chamberlain. He was raised to the rank of colonel in 1734, and distinguished himself greatly in Italy, especially at the battles of Parma and Guastalla, and in burning in the presence of the French army the bridge which the Marshal de Noailles had thrown over the Adige. He was made general in 1736; and in the following year, by an excellent manœuvre, he secured the retreat of the army, after the unhappy battle of Banjaluca, and saved the baggage.

In 1739 the emperor Charles VI. made him field-marshallieutenant, and counsellor in the aulic council of war. After the death of that prince, when the king of Prussia entered Silesia, Count Brown with a small body of troops disputed his progress inch by inch. He signalized himself on several occasions; and in 1743 the queen of Hungary made him a privy-counsellor at her coronation in Bohemia. Having passed into Bavaria, where he commanded the vanguard of the Austrian army, he seized Deckendorf, with a great quantity of baggage; and obliged the French to abandon the banks of the Danube, which the Austrians passed in security. In the same year, 1743, he was sent by the queen of Hungary to Worms, as plenipotentiary to the king of Britain, and did his utmost to bring about the treaty of alliance between the courts of Vienna, London, and Turin. In 1744 he followed Prince Lobkowitz into Italy; took Veletri on the 4th of August, in spite of the superior numbers of the enemy; entered their camp, overthrew several regiments, and took many prisoners. The following year he was recalled into Bavaria, where he took the town of Wilshosen by assault. The same year he was made general of artillery; and in January 1746 he marched for Italy at the head of 18,000 men, drove the Spaniards out of the Milanese; and having joined the forces under Prince de Lichtenstein, he commanded the left wing of the Austrian army at the battle of Placentia, June 15, 1746, and defeated the right wing of the enemy's forces commanded by Marshal de Maillebois. As commander-in-chief of the army against the Genoese, he seized the pass of Bocchetta, though defended by above four thousand men, and took Genoa. Count Brown at length joined the king of Sardinia's troops, and, in conjuction with them, took Mont-Alban and the county of Nice. On the 30th of November he passed the Var in spite of the French troops, entered Provence, and had taken the isles of St Margaret and St Honorat, when the revolution which happened in Genoa, and the advance of Marshal Belleisle obliged him to execute that masterly retreat which has elicited so much admiration. He employed the remainder of 1747 in defending the states of the house of Austria in Italy; and after the peace in 1748 he was sent to Nice, to regulate there, in conjunction with the Duke of Belleisle and the Marquis de la Minas, the differences that had arisen with respect to the execution of some of the articles of the definitive treaty of Aix-la-Chapelle.

The empress queen, to reward his services, made him governor of Transylvania, where he was generally esteemed for his probity and disinterestedness. In 1752 he obtained the government of Prague, with the chief command of the troops in that kingdom; in 1753 the king of Poland, elector of Saxony, honoured him with the collar of the order of the White Eagle; and the next year he was declared field-

When the king of Prussia, in 1756 entered Saxony, and attacked Bohemia, Count Brown encountered and repulsed him at the battle of Lowositz, October 1, with only 27,000 men, while the Prussians numbered at least 40,000. Seven days after this battle he undertook the famous march into Brown. Saxony, to deliver the Saxon troops shut up between Pirna and Konigstein. He at length obliged the Prussians to retire from Bohemia, for which service he was made a knight of the Golden Fleece. Soon afterwards Count Brown hastily assembled an army in Bohemia to oppose the king of Prussia; and on the 6th of May was fought the famous battle of Prague, in which, while employed in giving his orders for maintaining the advantages he had gained, he received a deadly wound. To be disabled at such a crisis was doubly unfortunate, as he had broken the Prussians, and the Count Schwerin, one of their greatest generals, was slain. Count Brown was carried to Prague, where he died of his wounds June 26, 1757, aged fifty-two.

Brown, William, an English poet, descended of a good family, and born at Tavistock in Devonshire, in 1590. Having passed through the grammar-school of his native place, he was sent to Exeter College, Oxford, and became tutor to Robert Dormer, afterwards Earl of Caernarvon. On leaving college, he was taken into the family of William Earl of Pembroke; and he improved his fortune so much that he purchased an estate. His poetical works which procured him a very great reputation, are entitled Britannia's Pastorals; The Shepherd's Pipe; An Elegy on the death of Prince Henry, eldest son of James I. The date of his death is uncertain. (Wood's Athen. Oxon.)

Brown, William Laurence, born at Utrecht, January 7, 1755, was the son of the Rev. William Brown, minister of the English church in that city. The father, having been appointed professor of ecclesiastical history at St Andrews, returned to Scotland in 1757; and his son was in due time sent to the grammar-school of that city. At the early age of twelve he became a student in the university, and obtained a greater number of prizes than fell to the share of any other competitor. After completing the preliminary curriculum, he became a student of divinity; and in 1774 he removed to the university of Utrecht, where he combined with the study of theology that of the civil law; and from this study he frequently declared that he had derived essential benefit.

In 1777, on the death of his uncle, Dr Robert Brown, who had succeeded as minister of the English church at Utrecht, the magistrates of that city offered the vacant charge to his young relation, an invitation which he finally accepted. He was licensed and ordained by the presbytery of St Andrews, and admitted minister of the English church at Utrecht in March 1778. His congregation, though respectable, was far from being numerous, seldom exceeding forty persons; yet his preparation for the pulpit was not less assiduous than at Aberdeen, where he had to address a larger audience. He increased his income by receiving pupils into his house; and he gradually extended his acquaintance among individuals distinguished by their talents and learning, as well as by their station and influence; while he enlarged his sphere of observation by various excursions in France, Germany, and Switzerland.

The curators of the Stolpian Legacy at Leyden having in 1783 proposed "The Origin of Evil," as the subject of their annual prize, Mr Brown obtained the second honour, namely, that of publication at the expense of the trust. His dissertation was accordingly printed, under the title of Disputatio de Fabrica Mundi, in quo Mala insunt, Naturæ Dei perfectissimæ haud repugnante. In 1784 the university of St Andrews created him D.D. On three different occasions he obtained the medals awarded by the Teylerian Society at Haarlem for the best compositions on certain prescribed subjects. These were, a dissertation On the Immortality of the Soul, which was never printed; An Essay on the Folly of Scepticism, &c., Lond. 1788, 8vo; An Essay on the natural Equality of Men, Edinb. 1793, 8vo. The latter work was the most successful of all his publications.

Before this period he had been appointed to a professor-

Browne. ship in the university of Utrecht. He had for some time been placed in a position of some difficulty, in consequence of the civil commotions, and his attachment to the Orange party. But when the armed interposition of the Prussians occasioned a sudden change in the government of Holland, and the friends of Dr Brown had regained their ascendency, the states and the magistrates of Utrecht jointly instituted a professorship of moral philosophy and ecclesiastical history, and appointed him to this new office.

On entering upon his duties, he pronounced an inaugural oration, which was published under the title of Oratio de Religionis et Philosophiæ Societate et Concordia maxime salutari. Traj. ad Rhen. 1788, 4to. Two years afterwards he was nominated rector of the university; and on resigning his temporary dignity, he pronounced an Oratio de Imaginatione, in Vitæ Institutione, regunda. Traj. ad Rhen. 1790, 4to. During this interval he had been offered the Greek professorship at St Andrews; but this honour he was induced to decline. To his other offices was now added the professorship of the law of nature; a branch of study intimately connected with ethics, and which, indeed, was at one period regularly discussed by the professors of moral philosophy in the Scottish universities, particularly by Dr Hutcheson, and his predecessor Mr Carmichael, as an essential part of their course.

The war which followed the French revolution finally drove Dr Brown from the place of his nativity. In the course of a very severe winter, he embarked in January 1795, with his wife, five children, and some other relations, in an open boat, and landed in England after a stormy passage. In London he experienced such a reception as was due to his literary talents and moral worth: and in 1795 the magistrates of Aberdeen appointed him to the chair of divinity on the retirement of Dr Campbell, and soon afterwards he was made principal of Marischal College.

Dr Brown soon became a very conspicuous member of the church, and some of his appearances in the General Assembly produced a powerful effect. His speech on the case of Dr Arnot was printed under the title of "Substance of a Speech delivered in the General Assembly of the Church of Scotland, on Wednesday the 28th of May 1800, on the Question respecting the Settlement, at Kingsbarns, of the Rev. Dr Robert Arnot, Professor of Divinity in St Mary's College, St Andrews." Edinb. 1800, 8vo.

His essay "On the Existence of a Supreme Creator" obtained Burnet's first prize, amounting to L.1250. The second prize, amounting to L.400, was awarded to Dr Sumner, afterwards archbishop of Canterbury. Dr Brown's work was published at Aberdeen, 1816, 2 vols. 8vo. His last considerable work was "A comparative View of Christianity, and of the other Forms of Religion which have existed, and still exist, in the World, particularly with regard to their Moral Tendency." Edinb. 1826, 2 vols. 8vo.

In the year 1800 Dr Brown had been appointed chaplain in ordinary to the king, and in 1804 dean of the chapel royal, and of the most ancient and most noble order of the Thistle. He was last of all appointed to read the Gordon lecture in Marischal College, and he delivered his inaugural discourse in November 1825. This was published in 1826, 8vo. His other publications were, a poem entitled "An Essay on Sensibility;" Sermons, Edinb. 1803, 8vo; "Philemon, a Poem," Edinb. 1809, 2 vols. 8vo; several detached sermons, and various tracts. He died on the 11th of May 1830, in the seventy-sixth year of his age.

BROWNE, EDWARD, eldest son of Sir Thomas Browne, was physician to Charles II. and president of the Royal College of Physicians of London. He was born in 1644; and studied at Cambridge, and afterwards at Merton College, Oxford. He published a brief account of his travels in Hungary, Servia, Bulgaria, Macedonia, Thessaly, Austria, Styria, Carinthia, Carniola, and Friuli; and likewise an account of several journeys through a great part of Germany. Browne. He also contributed some translations to an edition of Plutarch's Lives. He was acquainted with Hebrew, was a good Greek scholar, and no man of his age wrote better Latin. High Dutch, Italian, French, and other modern languages, were as familiar to him as his mother tongue. Charles II. said of him, "that he was as learned as any of the college, and as well bred as any at court." He died in 1708.

Browne, Isaac Hawkins, an ingenious English poet, born in 1705 at Burton-upon-Trent, Staffordshire, of which place his father was minister. He received his grammatical instruction first at Lichfield, and then at Westminster; whence, at sixteen years of age, he was removed to Trinity College, Cambridge, of which his father had been fellow. After taking his master's degree, he removed to Lincoln's Inn, where he applied closely to the study of the law. Not long after the commencement of his professional studies, he wrote a poem on Design and Beauty, which he addressed to his friend Highmore the painter. Here also he wrote his most popular poem, entitled *The Pipe of Tobacco*, in which he has given imitations of Cibber, Ambrose Philips, Thomson, Young, Pope, and Swift, who were then all living. In 1744 he married the daughter of Dr Trimnell, archdeacon of Leicester. He was elected in 1744 and again in 1748 to serve in parliament for the borough of Wenlock in Shropshire, near which place he possessed a considerable estate, left to him by his maternal grandfather. In 1754 he published his poem De Animi Immortalitate, in which, besides a judicious choice of matter and arrangement, he is thought to have shown himself a happy imitator of Lucretius and Virgil. The universal popularity of this poem produced several English translations of it; the best of which is given by Soame Jenyns, in his Miscellanies. The author intended to have added a third book, but of this he had left only a fragment. This amiable and gifted writer died, after a lingering illness, in 1760. In 1768 his son published an elegant edition of his father's poems, in large octavo.

Browne, James, LL.D., a learned and indefatigable man of letters, and for many years sub-editor of the seventh edition of the Encyclopædia Britannica, was born at Coupar-Angus in 1793. He was educated at Edinburgh, and afterwards removed to St Andrews, where he studied for the church. He wrote "The History of Edinburgh" for Ewbank's Picturesque Views of that city, 2 vols. 1823-25; in 1826, became a member of the faculty of advocates, and obtained the degree of LL.D. from King's College, Aberdeen; and in this same year he published a "Critical Examination of Macculloch's work on the Highlands and Islands of Scotland." In 1827 he published at Paris his Aperçu sur les Hieroglyphes d'Egypte; and in the following year there appeared his "Vindication of the Scottish Bar from the attacks of Mr Brougham." He was now appointed editor of the Caledonian Mercury; and two years later he became sub-editor of the Encyclopædia Britannica, to which he contributed a large number of valuable articles. He also published in 1838 a "History of the Highlands and Highland Clans," 4 vols. 8vo, of which various editions have since appeared. His mental activity was remarkable, and frequently urged him to exertions beyond his strength. His unremitting labours at last brought on a stroke of apoplexy, which terminated his existence in 1841.

Browne, Sir Thomas, an eminent physician and celebrated writer, descended of an ancient family in Cheshire, was born at London, October 19, 1605. After studying at Winchester School, and at Pembroke College, Oxford, he travelled through France and Italy; and returning through Holland, he took his degree of M.D. at Leyden. He began to practise at Shipden-hall near Halifax; but removed in 1636 to Norwich, where he was extensively employed in his profession. In the following year he was incorporated as a doctor of medicine at Oxford; and in 1641 he mar-

Browne. ried a lady of a good family in Norfolk. His famous work, entitled Religio Medici, first appeared in 1642. It was translated into Latin, and immediately procured for the author a European reputation. It was afterwards translated into almost every language in Europe. This singular work has been censured by some as inclining to infidelity, and even to atheism; while others, with better judgment, have applauded its religious tendency, as well as the ability and learning of the author. His well-known Treatise on Vulgar Errors, entitled Pseudodoxia Epidemica, was first published in 1646, and was received with equal applause. He also wrote a work called Hydriotaphia, or a Discourse of Sepulchral Urns found in Norfolk, which appeared in 1658. Browne's reputation as a physician, also, was very high. In 1664 he was elected an honorary member of the Royal College of Physicians; and in 1671 he was knighted at Norwich by Charles II. He died at Norwich, on the anniversary of his birthday, in 1682, and left a considerable number of MSS., which were published under the title of "The Posthumous Works of the learned Sir Thomas Browne, Knt., M.D."

Browne's style has been characterized as vigorous but rugged, learned but pedantic. " It is not on the praises of others," Dr Johnson remarks, "but on his own writings, that he is to depend for the esteem of posterity. of which he will not easily be deprived while learning shall have any reverence among men; for there is no science in which he does not discover some skill, and scarce any kind of knowledge, sacred or profane, abstruse or elegant, which he does not appear to have cultivated with success. His exuberance of knowledge and plenitude of ideas sometimes obstruct the tendency of his reasoning and the clearness of his decisions; on whatever subject he employed his mind, there started up immediately so many images before him, that he lost one by grasping another. His memory supplied him with so many illustrations, parallel or dependent notions, that he was always starting into collateral considerations; but the spirit and vigour of his pursuit always gives delight; and the reader follows him without reluctance through his mazes, in themselves flowery and pleasing, and ending at the point originally in view."

Browne's entire works were published at London in 1836, by Simon Wilkins, in 4 vols. 8vo.

Browne, Sir William, an eminent but very eccentric physician and multifarious writer, born in Norfolk in 1692. He settled originally at Lynn in Norfolk, where he published a translation of Dr Gregory's Catoptricæ et Dioptricæ Sphæricæ Elementa; to which he added some papers on the Foci of Specula, &c. Having acquired a competence by his profession, he removed to Queen's Square, London, where he resided till his death. A great number of lively essays, both in prose and verse, the production of his pen, were printed and circulated among his friends. The active part taken by Sir William in the contest with the licentiates, 1768, occasioned his being introduced by Foote in his Devil upon Two Sticks. Upon Foote's exact representation of him, with his identical wig and coat, tall figure, and glass stiffly applied to his eye, Brown sent him a card complimenting him on having so happily represented him; but as he had forgotten his muff, he sent him his own. This goodnatured man used to frequent the annual ball at the ladies' boarding-school, Queen Square, being fond of the company of sprightly young people. A dignitary of the church, finding, on one of these occasions, this upright figure stationed there, told him he believed he was Hermippus redivivus, who lived anhelitu puellarum. He survived his wife ten years, and died in 1774, at the age of eighty-two. By his will, which was written in Greek, Latin, and English, he made a provision for awarding three gold medals as yearly prizes to three undergraduates of Cambridge, for the best Greek and Latin poems, in imitation of Sappho, Horace, and Martial.

Browne, William George, an eminent traveller, born at Browne Great-Tower-Hill, London, July 25, 1768, was the son of a wine-merchant, descended from a good family in Cumberland. His constitution being weak, he was educated privately under Dr Whalley, the editor of Ben Jonson's works. At seventeen he was sent to Oriel College, Oxford; and he there went through an extensive course of classical reading. Having been left a moderate competence by his father, on leaving the university he applied himself entirely to literary pursuits. He embarked deeply in political questions, embracing with ardour the popular cause. He republished some political tracts, among which was part of Buchanan's De Jure Regni apud Scotos, and formed the plan of reprinting a regular series of such writings. But the fame of Bruce's travels, and of the first discoveries made by the African Association, determined him to become an explorer of Central Africa.

Accordingly, he left England at the close of 1791, and arrived at Alexandria in January 1792. He spent a few months in visiting Siwah, the supposed site of the temple of Jupiter Ammon; and employed the remainder of the year in examining the whole of Egypt. In the spring of 1793 he visited Suez and Sinai, and in May set out for Darfûr. This was his most important journey, in which he acquired a great variety of original information. He endured much hardship, and was unable to effect his purpose of returning by Abyssinia. He did not reach Egypt till 1796; after which he spent a year in Syria, and did not arrive in London till September 1798. In 1800 he published his travels in Africa, Egypt, and Syria, from the year 1792 to 1798, in one volume 4to. The work was highly esteemed. and is classed by Major Rennell among the first performances of the kind; but, from the abruptness and dryness of the style, it never became very popular. In 1800 Mr Brown again left England, and spent three years in visiting Greece, some parts of Asia Minor, and Sicily. He had made some progress in preparing for the press an account of this journey, but gave up his intention, for some reason unknown, and spent some years in retirement, employed in oriental studies. Tired, however, of this inactivity, in 1812 he set out on a more extensive journey, proposing to penetrate to Samarcand, and survey the most interesting regions of Central Asia. He spent the winter in Smyrna; and in the spring of 1813 proceeded through Asia Minor and Armenia, made a short stay at Erzerum, and arrived on the first of June at Tabriz, where he met Sir Gore Ouseley. About the end of the summer of 1813 he left Tabriz for Tehrân, intending to proceed thence into Tartary; but unhappily he never reached that destination. Near the banks of the Kizil-Ozan his party were attacked by banditti, and, according to the report of the survivors, Mr Browne was plundered and murdered. Suspicion attached to his companions, and even to the Persian government, but nothing occurred to confirm these surmises. Some bones, believed to be his, were afterwards found and interred near the grave of Thevenot, the celebrated French traveller.

Mr Browne was of a spare frame, rather above the middle size, of a grave and pensive cast of countenance, with an extraordinary predilection for the manners and character of the orientals: like them he was in general society silent and reserved; yet he possessed a friendly and generous disposition, and was distinguished by a strict regard to veracity.

His volume of travels in Africa has already been men-Walpole, in the second volume of his Memoirs relating to European and Asiatic Turkey (4to, 1820), has published, from papers left by him, the account of his journey in 1802 through Asia Minor to Antioch and Cyprus; also Remarks written at Constantinople. No account is preserved of his last journey, except what is contained in a letter to Mr Smithson Tennant.

BROWNIE, the name of a serviceable kind of sprite,

Brownie.

Brownists. who, according to a superstitious notion formerly prevalent in the Hebrides and Highlands of Scotland (as well as among the country people in England, where he had the name of Robin Goodfellow), was wont to clean the houses, help to churn, thresh the corn, and belabour all who pretended to make a jest of him. He was represented as stout and blooming, had fine long flowing hair, and went about with a wand in his hand. He was the very counterpart of Milton's Lub-

> BROWNISTS, a religious sect, which sprung out of that of the Puritans towards the close of the sixteenth century. Their leader, Robert Brown, who wrote divers books in their behalf, was a man of good parts and some learning. Brown, after suffering a series of persecutions from the bishops, left the kingdom, carrying with him his congregation, and settled at Middleburg in Zealand, where they obtained leave of the states to worship God in their own way, and form a church according to their own model. This handful of men, just delivered from the severities of the bishops, soon began to differ among themselves, and crumble into so many parties, that Brown their pastor grew weary of his office; and, returning to England in 1589, he renounced his principles of separation, was preferred to the rectory of a church in Northamptonshire, and died, after leading a very idle and dissolute life, in 1630. See Brown, Robert.

The revolt of Brown was attended with the dissolution of the church at Middleburg; but the seeds of Brownism which he had sown in England were so far from being destroyed, that Sir Walter Raleigh, in a speech in 1592, computed the number of Brownists at no less than twenty thousand. The occasion of their separation was not any fault they found with the faith, but only with the discipline and form of government of the other churches in England. They charged corruption equally on the Episcopal form and on that of the Presbyterians, by consistories, classes, and synods; nor would they join with any other reformed church, because they were not assured of the sanctity and regeneration of the members who composed it, on account of the toleration of sinners, with whom they maintained it an impiety to communicate. They condemned the solemn celebration of marriages in the church; maintaining that matrimony being a political contract, the confirmation of it ought to come from the civil magistrate. They would not administer baptism to the children of such as were not members of the church, or of such as did not take sufficient care of their children already baptized. They rejected all forms of prayer, and held that the Lord's prayer was not to be recited as a prayer, being only given for a rule or model whereon all our prayers are to be formed. The form of church government which they established was democratical. When a church was to be gathered, such as desired to be members of it made a confession and signed a covenant, by which they obliged themselves to walk together in the order of the gospel. The whole power of admitting and excluding members, with the decision of all controversies, was lodged in the brotherhood. The church officers were chosen from among themselves, for preaching the word and taking care of the poor, and were separated to their several offices by fasting, prayer, and imposition of hands of some of the brethren. But they did not erect the priesthood into a distinct order. As the vote of the brotherhood made a man a minister, and gave him authority to preach the word and administer the sacraments among them, so the same power could discharge him from his office, and reduce him to the condition of a mere layman again. And as they maintained that the bounds of a church were defined by the number of those who could meet together in one place, and join in one communion, so the power of these officers was confined within the same limits. The minister or pastor of one church could not administer the Lord's supper to another, nor baptize the children of any but those of his own society. Any lay brother was allowed the liberty

of prophesying, or of giving a word of exhortation to the Brownrigg people; and it was usual for some of them, after sermon, to ask questions, and reason upon the doctrines which had been preached. In a word, every church on the Brownists' model is a body corporate, having full power to do everything which the good of the society requires, without being accountable to any presbytery, synod, assembly, convocation, or other jurisdiction whatever. Most of their discipline has been adopted by the Independents, a party which afterwards arose from among the Brownists. The laws against the Brownists were executed with great severity; their books were prohibited by Queen Elizabeth, they were themselves often imprisoned, and many of them were hanged. The ecclesiastical commission and the star-chamber, in fine, distressed them to such a degree that they resolved to quit their country. Accordingly, many families retired and settled at Amsterdam, where they formed a church, and chose Mr Johnson for their pastor, and after him Mr Ainsworth, author of the learned commentary on the Pentateuch. Their church flourished during nearly a hundred years.

BROWNRIGG, WILLIAM, a celebrated physician, born in Cumberland, March 24, 1711. He studied medicine at London, and afterwards at Leyden, where he graduated as M.D. in 1737. This university was then in its highest splendour; Albinus taught anatomy, Euler mathematics, and the chair of medicine and chemistry was occupied by the accomplished Boerhaave. After a long and happy residence at Leyden, he returned to his native country, married, and settled in Whitehaven. He published his inaugural dissertation De Praxi medica ineunda, 4to, Lugd. Bat. 1737; and a treatise on the Art of making Common Salt, printed at London in 1748, in 8vo, which procured for him the addition of F.R.S.; also An Enquiry concerning the Mineral Elastic Spirit contained in the Water of Spa in Germany, which obtained the Copley gold medal; and, lastly, a treatise On the Means of Preventing the Communication of Pestilential Contagion, 1771. A few years before his death he retired to his seat at Ormethwaite, near Keswick, where he died, Jan. 6, 1800, at the age of eighty-eight.

BRUAR, FALLS OF. See BLAIR-ATHOLL. BRUCE, JAMES, F.R.S. This enterprising and enlightened traveller was a descendant, by the female side, of the royal house of Bruce, and was born at the family seat, Kinnaird House, Stirlingshire, on the 14th Dec. 1730.

He received the elements of his education at Harrow, where he made considerable progress in his classical studies. Returning to Scotland, he applied to the study of law; but having no relish for this pursuit, he determined to push his fortune in the East Indies, and for that purpose went to London. While in the metropolis, soliciting permission from the directors of the East India Company to go out and settle under their auspices as a free trader, he was introduced to a Miss Allan, whom he married in the beginning of the following year. He now abandoned his East India speculations, and devoted himself to commerce as a wine-merchant. His wife having fallen into a bad state of health, Bruce, in hopes that the genial climate of the south of France would benefit her, proceeded thither. But she died on the journey, within a year after her marriage.

Bruce returned to his business in London, but the bond which had connected him with it was now broken; and giving up the principal management of the concern to his partner, he applied himself to studies calculated to dispet the grief which had settled on his mind. For two years he laboured at the Spanish and Portuguese languages, which he learned to pronounce with great accuracy. He also assiduously practised several styles of drawing. His business having afforded him an opportunity of visiting the Continent, he proceeded thither, and travelled first through Portugal and afterwards through Spain. In the latter country, the traces of oriental manners still visible, the desolate pa-

Bruce.

Bruce. laces of the caliphs, and the tales of chivalry interwoven with the Moorish wars, awakened in his mind that spirit of romantic enterprise which afterwards led him to the fountains of the Nile. At Madrid he proposed to explore the collections of Arabic manuscripts which were buried in the monastery of St Lawrence, and in the library of the Escurial. Disappointed in this expectation by the jealousy of the Spaniards, he proceeded to France, and afterwards to Holland; but on receiving the news of his father's death, he returned to England.

By the demise of his father he succeeded to an inheritance which, though respectable, was inadequate to the wants of his growing ambition. From the period of his return in 1758 to the year 1761, he intently employed himself in the acquisition of the eastern languages. A circumstance had occurred which introduced him to Mr Pitt. While at Ferrol in Galicia, there was a rumour of a war between Great Britain and Spain. It immediately occurred to the fertile mind of Bruce that a descent upon Spain at this point could scarcely fail of being successful. He boldly resolved to submit his project to Mr Pitt, through his friend Mr Wood, under-secretary of state, to whom he fully explained the circumstances on which he had formed his opinion. Mr Bruce was sent for, and, after a conversation upon the subject, at Mr Pitt's suggestion he drew up a memorandum of his project. He was then informed by Mr Wood that Mr Pitt intended to employ him upon a particular service; that he might, however, go down and settle his affairs in his own country, but by all means to be ready when called upon. No time was lost on his part; but just after he received orders to return to London, that minister resigned.

Notwithstanding this disappointment, which he very sensibly felt, his hopes promised to be yet realized. The memorandum which he drew up for Mr Pitt had been laid before the king, and strongly recommended by Lord Halifax. The Earl of Egremont and Mr Greville had several meetings with Mr Bruce upon the subject; but the death of Egremont put an end to his expectations for the present. Lord Halitax, however, had appreciated Bruce's character. He proposed to him a journey to the coast of Barbary, which had as yet been but partially explored by Dr Shaw. The discovery of the source of the Nile also formed a subject of conversation; and it is unnecessary to state that the enterprising mind of Bruce eagerly caught up the idea.

At this very time the consulship of Algiers became vacant, and Mr Bruce was pressed by Lord Halifax to accept it, as it presented a very favourable opportunity for making the proposed expedition.

This event determined him. After providing a large apparatus of instruments, he set out for Italy through France. On his arrival at Rome he was ordered to proceed to Naples, there to await His Majesty's commands. From Naples he again returned to Rome, and from thence proceeded to Leghorn, where he at last embarked for Algiers, and arrived there on the 15th of March 1762.

"After a year spent at Algiers, constant conversation with the natives while abroad, and with my manuscripts within doors, had qualified me to appear in any part of the Continent without the help of an interpreter. Ludolf had assured his readers that the knowledge of any oriental language would soon enable them to acquire the Ethiopic; and I needed only the same number of books to have made my knowledge of that language go hand in hand with my attainments in the Arabic. My immediate project of setting out on my journey to the inland parts of Africa had made me double my diligence; night and day there was no relaxation from these studies, although the acquiring any single language had never been with me either an object of time or difficulty.

At Algiers Mr Bruce was detained longer than he ex-VOL. V.

pected, in consequence of a dispute with the dey concerning Mediterranean passes. This being adjusted, he proceeded to Mahon, and from Mahon to Carthage. He next visited Tunis and Tripoli, and travelled over the interior parts of these states. At Bengazi, a small town on the Mediterranean, he suffered shipwreck, lost all his baggage, and with extreme difficulty saved his life. He afterwards sailed to the isles of Rhodes and Cyprus; and proceeding to Asia Minor, travelled through a considerable part of Syria and Palestine, visiting Hassia, Latakia, Aleppo, and Tripoli, near which last city he was again in imminent danger of perishing in a river. The ruins of Palmyra and Baalbec were next carefully surveyed and sketched by him. His drawings of these places were deposited in the royal library at Kew: "the most magnificent present in that line," to use his own words, "ever made by a subject to his sovereign." Bruce published no particular account of these various journeys; but Dr Murray, in the second edition, introduced from Bruce's MSS. some account of his travels in Tunis.

In these various travels some years were passed; and Bruce now prepared for the grand expedition, the accomplishment of which had ever been nearest his heart,—the discovery of the supposed sources of the Nile. In the prosecution of that dangerous object he left Sidon on the 15th of June 1768, and arrived at Alexandria on the 20th of that month. He proceeded from thence to Cairo, where he remained till the 12th of December following, when he embarked on the Nile, and sailed up the river as far as Syene, visiting in the course of the voyage the ruins of Thebes. Leaving Kennè on the Nile on the 16th February 1769, he crossed the desert of the Thebaid to Cosseir on the Red Sea, and arrived at Jidda on the 3d of May. In Arabia Felix he remained (not without making several excursions) till the 3d of September, when he sailed from Loheia, and arrived on the 19th at Masuah, where he was detained near two months by the treachery and avarice of the navib of that place. It was not till the 15th of November that he was allowed to quit Arkeeko, near Masuah; and he arrived on the 15th of February 1770 at Gondar, the capital of Abyssinia, where he ingratiated himself with the most considerable persons of both sexes belonging to the court. Several months were employed in attendance on the king, and in an unsuccessful expedition round the lake of Dem-Towards the end of October he set out for the sources of the Bahr el Azrek, which he supposed to be the principal branch of the Nile, though it is now generally agreed that this rank ought to be assigned to the Bahr el Abiad. At this long-desired spot he arrived on the 14th of November; and his feelings on the accomplishment of his wishes cannot be better expressed than in his own words:

"It is easier to guess than to describe the situation of my mind at that moment, standing in that spot which had baffled the genius, industry, and inquiry of ancients and moderns for the course of near three thousand years. Kings had attempted this discovery at the head of armies; and each expedition was distinguished from the last only by the difference of the numbers which had perished, and agreed alone in the disappointment which had uniformly and without exception followed them all. Fame, riches, and honour had been held out for a series of ages to every individual of those myriads whom princes commanded, without having produced one man capable of gratifying the curiosity of his sovereign, or wiping off this stain upon the enterprise and abilities of mankind, or adding this desideratum for the encouragement of geography. Though a mere private Briton, I triumphed here in my own mind over kings and their armies; and every comparison was leading nearer and nearer to the presumption, when the place itself where I stood, the object of my vain-glory, suggested what de-

Bruce. pressed my short-lived triumphs. I was but a few minutes arrived at the source of the Nile, through numberless dangers and sufferings, the least of which would have overwhelmed me, but for the continual goodness and protection of Providence; I was, however, but then half through my journey, and all those dangers which I had already passed awaited me again on my return. I found a despondency gaining ground fast upon me, and blasting the crown of laurels I had too rashly woven for myself.

"I was, at that very moment, in possession of what had for many years been the principal object of my ambition and wishes; indifference, which, from the usual infirmity of human nature, follows, at least for a time, complete enjoyment, had taken place of it. The march and the fountains, upon comparison with the rise of many of our rivers, became now a trifling object in my sight. I remembered that magnificent scene in my own native country, where the Tweed, Clyde, and Annan rise in one hill; three rivers, I now thought, not inferior to the Nile in beauty, preferable to it in the cultivation of those countries through which they flow; superior, vastly superior, to it in the virtues and qualities of the inhabitants, and in the beauty of the flocks, crowding its pastures in peace, without fear of violence from man or beast. I had seen the rise of the Rhine and Rhone, and the more magnificent sources of the Saone; I began, in my sorrow, to treat the inquiry about the source of the Nile as a violent effort of a distempered fancy. Grief and despondency now rolling upon me like a torrent, relaxed, not refreshed, by unquiet and imperfect sleep, I started from my bed in the utmost agony. I went to the door of my tent. Every thing was still; the Nile, at whose head I stood, was not capable either to promote or to interrupt my slumbers; but the coolness and serenity of the night braced my nerves, and chased away those phantoms that while in bed had oppressed and tormented me."

The object of his wishes being now gratified, Bruce bent his steps towards his native land. He arrived at Gondar on the 19th November 1770, but found that it was by no means an easy task to obtain permission to quit Abyssinia. A civil war in the mean time breaking out, several engagements took place between the king's forces and the troops of the rebels, particularly three actions at a place called Serbraxos, on the 19th, 20th, and 23d of May 1771. In each of these Mr Bruce acted a considerable part; and for his valiant conduct in the second, received, as a reward from the king, a chain of gold. At Gondar, after these engagements, he again preferred the most earnest entreaties to be allowed to return home; and it was only when his health at last gave way, that the king consented to his departure, but on condition of his engaging to return in the event of his recovery, with as many of his kindred as he could persuade to accompany him.

After a residence of nearly two years in that wretched country, Bruce left Gondar on the 16th of December 1771, taking the dangerous way of the desert of Nubia, instead of the more easy road of Masuah, by which he entered Abyssinia. He was induced to take this route, from his former experience of the cruel and savage temper of the nayib of Masuah. Arriving at Teawa on the 21st March 1772, he had the misfortune to find the sheikh Fidele at Atbara the counterpart of the nayib of Masuah. By his intrepidity and prudence, however, he obtained permission to depart next day, and he arrived at Sennaar on the 29th of the same month.

Mr Bruce was detained upwards of four months at that miserable and inhospitable place. This delay was occasioned by the villany of those who had undertaken to supply him with money; but at last, by disposing of nearly the whole of his gold chain, the well-earned trophy of Serbraxos, he was enabled to proceed on his journey.

He left Sennaar on the 5th of September, and arrived on Bruce, the 3d of October at Chendi, which he quitted on the 20th, and travelled through the desert of Gooz, reaching the village of that name on the 26th of October. On the 9th of November he left Gooz, and entered upon the most dreadful and dangerous part of his journey. All his camels having perished, he was under the necessity of abandoning his baggage in the desert, and with the greatest difficulty reached Assouan upon the Nile on the 29th of November. After some days' rest, having procured fresh camels, he returned into the desert, and recovered his baggage, among which was a quadrant of three feet radius, supplied by Louis XV. from the military academy at Mar-

On the 10th of January 1773, after more than four years' absence, he arrived at Cairo, where, by his manly and generous behaviour, he so won the heart of Mahomet Bey, that he obtained a firman permitting the commanders of English vessels belonging to Bombay and Bengal to bring their ships and merchandise to Suez, a place far preferable in all respects to Jidda, to which they were formerly confined. Such was the conclusion of his laborious and memorable journey through the desert.

At Cairo Mr Bruce's earthly career had nearly been concluded by a disorder in his leg, occasioned by a worm in This accident kept him five weeks in extreme agony, and long continued to affect his health. On his return to Europe he was received with all the admiration due to his enterprising character. After passing a considerable time in France, particularly at Montbard, with his friend the Comte de Buffon, he at last revisited his native country after an absence of more than twelve years.

The publication of his travels was delayed by several circumstances, among which may be mentioned the death of his second wife, his own impaired health, and a series of law-suits which resulted from his long absence from his native country. His long expected work accordingly did not appear till 1790, seventeen years after his return to Europe. It consisted of five large quarto volumes, embellished with plates and charts. It is unnecessary to enter_into any criticism or analysis of this celebrated work. The very singular and extraordinary picture which it gives of Abyssinian manners startled the belief of some. He stated one fact in particular which shipwrecked his reputation; and the world of literature, from Johnson down to the author of Munchausen, ridiculed the statement as unworthy of credit. It was, that the Abyssinians were in the practice of eating raw slices cut out of a living cow. This, though believed in France and other Continental countries, was treated in England as a fable. The shafts of ridicule, envy, and malice, were levelled at his devoted head; and all that he received at the hands of his contemporaries was obloquy and contempt. Posterity, however, has done him justice. Every succeeding traveller who has visited the country bears testimony to his veracity; and his most startling statements have since been fully verified. See Abyssinia. There are indeed a few errors in dates and other circumstances, but they are of trifling importance, and in no degree detract from the general authenticity of his narrative.

The first impression was quickly disposed of, and a second edition was preparing for the press, when death removed the author from this transitory stage. The cause of his death was an accident. While attending some visitors down stairs, his foot slipped, and he fell headlong. He remained in a state of insensibility for eight or nine hours, when he expired on the 27th of April 1794, in the sixty-fifth year of his age. He married, for his second wife, Mary, eldest daughter of Thomas Dundas of Fingask, who predeceased: her husband by ten years. By this marriage Mr Bruce had two sons and one daughter.

The second edition of his travels was published in 1805,

Bruce

Brucker.

Bruce.

in seven vols. 8vo, with a quarto volume of plates, edited by Dr Alexander Murray, who obtained access to all his papers, and illustrated the work with a learning and research which established his fame as an oriental scholar. A third edition appeared in 1813.

There never, perhaps, existed a man better qualified than Bruce for the hazardous enterprise he undertook. height exceeded six feet, and his size as well as his physical strength was proportionally great. He excelled in all personal accomplishments, being a practised and indefatigable swimmer, trained to exercise and fatigue of every kind, while his long residence among the Arabs had given him a more than ordinary facility in managing the horse. In the use of fire-arms he was almost unerring in his aim, and his dexterity in handling the spear and lance on horseback was very great. He was master of many languages, understood Greek perfectly, and was so well skilled in oriental literature that he revised the New Testament in Ethiopic, Samaritan, Hebrew, and Syriac, making many useful notes and remarks on difficult passages. He had applied from early youth to mathematics, drawing, and astronomy, and had acquired some knowledge of physic and surgery. His memory was astonishingly retentive, and his judgment sound and vigorous. He was dexterous in negotiation, a master of public business, animated with the warmest zeal for the glory of his king and country, a physician in the camp or city, a soldier and horseman in the field; whilst, at the same time, his breast was a stranger to fear, though he took every precaution to avoid danger. Such, at least, is his own representation of his character; and though an impartial judge would probably make some abatement for the natural bias of a man drawing his own portrait, yet it cannot be denied that in personal accomplishments Bruce equalled any of his contemporaries; that he was distinguished for vigour of understanding, as well as great literary attainments; and that in active and persevering intrepidity he has never been excelled.

Bruce, Michael, the son of a weaver in a hamlet three miles south of Kinross, was born in 1746. He was destined by his family for the office of pastor in a dissenting chapel, for which purpose his parents sent him to Edinburgh in 1762. His health was never robust; and about 1765, his biographer, Dr Anderson, mentions that he began to exhibit that grave melancholy which tinges the beautiful productions of the muse of this amiable young man. In the autumn of 1766 consumption had evidently begun to mark him for its victim. He lingered through the winter, and perished in the succeeding spring, at the early age of twenty years. His poems were collected and published after his death by Logan, a kindred poetic spirit, for the benefit of Bruce's family. They were immediately brought into notice by the elegant and feeling criticism on them by Lord Craig, in the 36th number of *The Mirror*. Many of them breathe a fine spirit of love for the simple beauties of nature, and a deep pathos; as for example the fine elegiac stanzas on his own approaching dissolution, beginning,

## Now spring returns, but not to me returns The vernal joys my better years have known;

the poem entitled Lochleven; and the lines To the Cuchoo. Bruce, Robert, king of Scotland, was born in the year 1274, and was grandson of that Robert Bruce, lord of Annandale, who was competitor for the crown with John Baliol. In his earlier life he was attached to the interest of Edward I. of England; yet his conduct was cautiously neutral, and he was therefore narrowly watched by that politic monarch. In the year 1299 he was associated with John Comyn, as one of the regents of Scotland; but, from the powerful rivalship that existed between them, the coalition did not last long. We find him shortly afterwards in favour with Edward. At this time he entered into a secret league with Comyn and the bishop of St Andrews

to establish his claim to the throne. Comyn, however, revealed it to Edward; and Bruce having his suspicion excited, fled to Scotland, collected his friends and followers, and proceeded to Scone, where he was solemnly crowned on the 27th of March 1306. He proceeded to expel the English from the kingdom; but was surprised at Methven, near Perth, and completely routed. For two years after this his life may be considered as a romance. He and his band suffered the greatest hardships in sustaining life, and in making head against the numerous foes who on all sides surrounded them. From 1308 to the establishment of his kingdom by the battle which he gained at Bannockburn on 24th June 1314, over the English commanded by Edward II. in person, he and his generals were continually engaged in warfare, making incursions into England, and reducing the strongholds in Scotland which were still garrisoned for the English interest. The consolidation of his kingdom was not allowed to be made in peace; for from the period of that celebrated battle he was constantly engaged in war with England, and with such success, that Edward and his nobles were reduced to the necessity of accepting terms of peace on the condition of renouncing all their pretended superiority over Scotland, of recognising it as a free and independent kingdom, and acknowledging Bruce to be its king. He died at Cardross, on the 7th June 1329, at the age of fifty-five, and was buried at Dunfermline. On his death-bed he expressed a wish that his heart might be conveyed to the Holy Land, whither he had often meditated a pilgrimage to atone for the murder of the Red Comyn. The good Lord James of Douglas undertook to fulfil the dying prayer of his king, but landing in Spain to help the Christians against the Moors, he was slain in battle. The heart of Bruce was brought back to Scotland by the survivors, and buried before the high altar of Melrose Abbey. See Scotland.

BRUCHSAL, a town in the grand duchy of Baden, circle of the middle Rhine, on the Salzbach, 14 miles from Carlsruhe. It was formerly the seat of the bishop of Spires, whose magnificent palace is still extant; and it has a townhouse, gymnasium, hospital, barracks, and a considerable

trade in wine. Pop. 7800.

BRUCK, a circle in the Austrian province of Steyermark, extending over 3696 square miles. It is situated in a mountainous district, with valleys between the ranges, of moderate fertility. Pop. (1851) 187,543. The chief place, of the same name, at the junction of the river Mur with the Mürz, contains about 2000 inhabitants, and has a considerable transit trade.

BRUCKENAU, a town and fashionable watering-place of Bavaria, in the circle of Lower Franconia, on the Sinn, 16 miles N.W. of Kissingen. Pop. 1800. The baths are situated in the pleasant valley of the Sinn, two miles from the town, and are annually frequented by the king of Bavaria.

BRUCKER, James, theologian, historian, philologer, and biographer, was born at Augsburg on the 22d of January 1696. His father, who was a respectable burgher, destined him for the church; and his own inclinations according with his father's wishes, he was sent, at the usual age, to pursue his studies in the university of Jena. Here he took the degree of master of arts in 1718; and in the following year he published his Tentamen Introductionis in Historiam doctrinæ de Ideis, in 4to; a work which he afterwards amplified and completed, and republished under the title of Historia Philosophica doctrinæ de Ideis, at Augsburg in 1723. He returned to his native city in 1720; but here his merit having attracted envy rather than recompense, he was induced to accept of the office of parish mini-ster of Kaufbevern in 1723. In the same year he published a memoir De Vita et Scriptis Cl. Etingeri, Augs. 8vo. His reputation having been at length established by these learned works, in 1731 he was elected a member of the Academy

Brucker. of Sciences at Berlin; and soon afterwards he was invited to Augsburg to fill the honourable situation of pastor and senior minister of the church of St Ulric. He published in the same year three dissertations relating to the history of philosophy, under the title of Otium Vindelicum, sive Meletematum Historico-philosophicorum triga, Augsburg, 1731, 8vo. Besides several smaller dissertations on biography and literary history, printed at different times, and which he afterwards collected in his Miscellanea, he published at Ulm, in 1737, Neue Zusätze verschiedener Vermehrungen, &c., zu den kurtzen Fragen aus der Philosophischen Historie, 7 vols. 12mo. This work, being a history of philosophy in question and answer, contains many details, especially in the department of literary history, which he has chosen to omit in his greater work on the same subject. He was forced by the booksellers, in opposition to his own opinion, to adopt the erotematic method, which at that time had been rendered popular by the writings of Hubner and Rambach.

In 1741, at Leipzig, appeared the first volume of his great work, Historia Critica Philosophiæ, a mundi incunabulis ad nostram usque ætatem deducta. Four other ponderous quartos, completing the first edition of this elaborate history, followed in 1744. Such was the success of this publication, that the first impression, consisting of four thousand copies, was exhausted in twenty-three years, when a new and more perfect edition, the consummation of the labours of half a century devoted to the history of philosophy, was in 1767 given to the world in six volumes quarto. The sixth volume, consisting entirely of supplement and corrections, is applicable to the first as well as to the second edition. Of the merits of this work we shall speak in the sequel.

His attention, however, was not wholly occupied by this stupendous undertaking. The following books would of themselves have been sufficient to exhaust the industry of any ordinary author: - Pinacotheca Scriptorum nostra ætate literis illustrium, &c., Augsburg, 1741-55, folio, in five decads. Ehren Tempel der Deutschen Gelehrsamkeit in welchem die Bildnisse gelehrter Mönner unter den Deutschen aus dem XV. XVI. und XVII. Jahrhundert aufgestellet, und thre Geschichte, &c. entworfen sind, Augsburg, 1747-49, 4to, five decads. Institutiones Historiæ Philosophicæ, Leipzig, 1747, 8vo, a second edition, ibid. 1756; and a third has been published since Brucker's death, with a continuation by Professor Born of Leipzig, in 1790. Miscellanea Historia Philosophica Literaria Critica olim sparsim edita nunc uno fasce collecta, Augsburg, 1748, 8vo. Erste Anfangsgrunde der Philosophischen Geschichte, als ein Auszug seiner grossern Werke, zweyte Ausgabe, Ulm, 1751, 8vo. He likewise superintended and corrected an edition of Luther's translation of the Old and New Testament. with a Commentary extracted from the writings of the English theologians, Leipzig, 1758-70, folio, six parts. His death ensued before the completion of this work, which has since been accomplished by Teller. He died at Augsburg in 1770; and he may be added to the catalogue of Huetius, to prove that literary labour is not incompatible with sound health and longevity. (See Saxii Onomasticon; Biographie Universelle; Gesner's Isagoge.)

It is only by his writings on the history of philosophy that Brucker is now known in the literature of Europe. In this study his great work forms an important era, and even at the present day it is the most extensive and elaborate upon the subject. It is, however, a work of which the defects are great, and its errors have been important in their consequences, in proportion to the authority it has acquired. We shall, therefore, hazard a few general observations on the defects which chiefly detract from the perfection and utility of the Critical History of Philosophy.

If Brucker had carried into this study a penetration equal to his diligence, and had his general comprehension of the scope and nature of the subject corresponded with the ela-

borate minuteness of his details, he would have left us a Brucker. work which might have had some pretensions to be considered as a rational history of human opinion. He lived, however, at a period when these different qualities were only beginning to be conjoined, and when as yet the history of philosophy had been written merely as a chronicle of the passing theories of individuals and sects. To give to the science of history a regular and connected form, and to arrange the narrative of successive events, and still more of successive opinions, according to the relation they bear to principles of established influence, was an attempt of which few in that age had any conception, and of which Brucker certainly had none. In civil history it was then believed that the historian had fulfilled all the duties of his office it he strung together the events which were known or believed to have occurred, in good language, and garnished them occasionally by a few general reflections on the absolute motives of human action. A very different notion is now held of the functions of the historian. He who at present attempts to write the history of any country, must reflect, before he begins, what were the chief occurrences in that history, and what were the revolutions which the manners and constitution of that particular nation have undergone. He must bear with him, from the commencement to the conclusion of his labours, a constant impression that every occurrence should be more or less considered, not only as it took place, and as it bore an influence on contemporary affairs, but as it may have remotely contributed to the events, and the opinions, and the character of succeeding times. But if this be true in regard to the histories of particular nations, it is evident that, by how much the traces of opinions are more light and evanescent than those of events, by how much the speculations of philosophers whose writings have either perished or come down to us mutilated and obscure, are more difficult to be appreciated in their causes, and connections, and consequences, than the actions of warriors and statesmen,—by so much the more is it necessary in philosophical than in civil history to combine reasoning with erudition, and to substitute the researches of the philosopher for the details of the chronicler. History and philosophy are two different things; and he who would write the history of philosophy must excel in both. Bacon had long ago required this union, and had pointed out the manner in which the historian of literature should endeavour to establish those principles of connection which constitute the soul and charm of such a history; how, by detecting the union of effects and causes, he might be enabled to determine the circumstances favourable or adverse to the sciences; and how, in short, by a species of enchantment, he might evoke the literary genius of each different age. The fulfilment of this plan was, however, far beyond the capacity of Brucker, and was an undertaking of which he had even no conception. Better qualified by nature and education for amassing than arranging materials, he devoted his principal attention to a confused compilation of facts, leaving to others their application, the discovery of their mutual connections, and the formation of the scattered fragments into a whole.

The merit of his great work consists entirely in the ample collection of materials. The reader who would extract any rational view of the progress of opinion must peruse it with a perpetual commentary of his own thoughts. He will find no assistance from his author in forming any general views, or in tracing the mutual dependencies of the different parts of the subject. Brucker has discovered the fountains of history, but he has made us drink of them without purifying the draught. Even in this respect his merit has been greatly overrated. Vast as is the body of materials which he has collected, we are always missing those very things which we might reasonably have expected would have been the first objects of a rational inquirer, and we are continually disappointed of the information we are most anxious

Bruges.

Brucker. to acquire. The idle and slavish attention which he has bestowed on previous compilers, has frequently diverted him from the study of the original authors themselves. Quoting the passages of the ancients from others, or trusting perhaps to the reference of an index, he has frequently overlooked those very testimonies which could have given us the most authentic knowledge of the opinions or characters of ages and individuals. He has often presented the authorities he has adduced, mutilated or misapplied; and this either from not having sufficiently studied these passages in their general connection with the system they illustrate, or from having been unable to withdraw them from the obscurity in which they were involved. He has shown no critical sagacity in distinguishing the spurious from the authentic, or in balancing the comparative weight of his authorities. He has frequently transcribed where he ought to have explained the words of the original authors; and, without taking into account the different value of the same term in different nations and ages, he has left us to apply a doubtful or erroneous meaning to words which might have been easily rendered by other expressions, and to suppose a distinction in the sense where there only existed a difference in the language. The glaring errors, even, which occasionally occur in his expositions of the Grecian philosophy, while they are inconsistent with any critical knowledge of the tongue, would make us suspect that he was in the habit of relying on the treacherous aid of translations. In short, if we knew nothing more of the ancient philosophers than what we acquire from Brucker, we should be often obliged to attribute to them opinions so obscure, or so absurd, that we must either believe ourselves wrong in the interpretation, or be unable to comprehend the cause of all the admiration and reverence they have received.

He has discovered little skill in his analysis of the different systems of philosophy; and the confusion of what is essential and principal with what is accidental and subordinate clearly evinces that these abridgments were thrown together while acquiring, in detail, a knowledge expressly for the purpose, instead of being the consummation of a long and familiar meditation on the subjects in all their modifications and dependencies. He has dwelt with the most irksome minuteness on every unimportant and doubtful circumstance in the lives of the philosophers; but he has too often overlooked the particular and general causes that produced an influence on the destinies of their philosophy. The aphoristic method which he has adopted prevents him from following a consecutive argument throughout its various windings. The most convincing reasoning in his hands loses much of its demonstration and beauty; and every ingenious paradox comes forth from his alembic a mere caput mortuum.—a residue from which every finer principle has been expelled. Where the genius of the philosopher is discovered more in the exposition and defence than in the original selection and intrinsic stability of his tenets, Brucker has not found the art of doing justice both to the philosopher and his opinions, or of conveying to the reader any conception of the general value of the original. This last defect, it must, however, be acknowledged, is more or less inseparable from every abstract of opinions, where it is always necessary to separate in some degree what is essential to the subject from what is peculiar to the man. He has relieved the sterility of his analysis by none of the elegancies of which the subject was susceptible. Without any pretension to purity, his diction is defective even in precision; and his sentences, at all times void of harmony and grace, are abrupt, and often intricate in their structure.

The person, therefore, who would attempt to write a history of philosophy without the imperfections of that of Brucker, must draw from obscurity many important facts hitherto omitted, he must arrange and combine these in a more perspicuous order; and, above all, he must review the

opinions he shall thus relate and methodize with a more accurate criticism. He ought not to write of Peripatetics like a disciple of Aristotle, of Platonists like a pupil of Proclus, nor of the doctrines of the Porch like a follower of Zeno. Still less must be compare the tenets of one sect by the principles of another; or endeavour to estimate doctrines, dubious in themselves, by reference to a standard equally arbitrary and contingent. He must place himself, to use the language of Lucretius, upon the highest pinnacle of the temple of science, from which he may look calmly back, and compare and study the doctrines of all these departed sages, without being himself involved in the partialities of particular sects or opinions,-

> Despicere unde queat alios, passimque videre Errare, atque viam palanteis quærere veri.

He must honour the genius of all alike, and believe that all are deserving of commendation, although all are more or less subject to error. He ought, in short, to be a philosopher superior even to the prejudices of philosophy.

If we take a survey of what has been attempted since the death of Brucker in accomplishing a more perfect history of philosophy, we shall find that more has been done in illustrating the philosophical tenets of particular sects, or the progress of particular portions of science, than in giving a comprehensive view of the general history of thought. In France, in Italy, and in our own country, those who have laboured in this department, far from being able to correct the errors of Brucker, have, in general, through defect of erudition, been wholly indebted to his industry for their materials, and have been content to rely on his accuracy with more than Pythagorean faith. If we except some ingenious speculations, which are more of the nature of philosophical essays on the history of philosophy, and which endeavour rather to illustrate the general spirit than to detail the particular opinions of the philosophers, there is nothing valuable on this subject to be found in the literature of these countries. Among the learned of his own country Brucker has never enjoyed a very distinguished reputation; and the Germans, while they were the most capable of discovering his defects, have had the honour of most sedulously and successfully endeavouring to supply them. We are indebted to them especially for many valuable treatises on the history of particular portions of philosophy, in which we find at length a profound reasoning united to an extensive and original erudition. The works of Meiners, Fulleborn, Tiedmann, and perhaps Buhle, deserve especially to be distinguished. An undertaking, however, which, from the extent of its plan, as well as the ability of its execution, claims particular notice, is the History of Philosophy, by Professor Tenneman of Jena. This work, as far as it is completed, affords us the most accurate, the most minute, and the most rational view we yet possess of the different systems of philosophy, in their intrinsic and relative bearings. The author has not only given us a minute analysis of each system, the result of a profound and familiar study of the original philosopher, but he has also displayed to us his philosophy, divested of its peculiarities, and compared with others by a general and impartial review. The main defect of this work, at least in reference to readers not German, is, that, like Buhle and the other disciples of Kant, he has taken the critical philosophy as the vantage-ground from which to make his survey of all former systems. Thus the continual reference to the peculiar doctrines of the school of Kant, and the adoption of its language, render it frequently impossible for those who have not studied the dark works of this modern Heraclitus to understand the strictures of Tenneman on the systems even of Aristotle or Plato.

BRUGES (in Flemish BRUGGE), a city of Belgium, capital of West Flanders, is situated in the midst of a fertile plain, intersected by the canals of Ghent, Ostend, and Sluys, in Lat. 51. 12. N. and Long. 3. 13. E. It is direct

Bruin

Bruges.

about 7 miles from the sea, 12 miles east of Ostend, 24 N.W. of Ghent, and 60 miles in the same direction from Brussels. The history of Bruges dates from a very remote period. In the seventh century of the Christian era it had emerged into importance; and its corporation of weavers, which in the best days of Bruges numbered 50,000 men, were already highly renowned in the time of Charlemagne. In the ninth century Bruges became subject to the counts of Flanders, who resided there, and made this city one of the most populous and wealthy in Europe by the great advantages and immunities which they offered to merchants and manufacturers. The privileges which the inhabitants sometimes received and sometimes exacted from their rulers, they guarded with the most jealous care, and not unfrequently rose in arms for their defence. Though Bruges, and Ghent, and other Flemish towns, owned a common lord, their interests were never identified, and they seldom let an opportunity pass of doing each other as much injury as possible. The ruinous consequences which this selfish policy entailed upon some of these cities, are admirably unfolded in Henry Taylor's Drama of Philip van Artevelde. From the ninth to the middle of the fourteenth century, Bruges was subject to the counts of Flanders. At that latter date it passed by marriage under the dominion of the dukes of Burgundy, under whom it attained the culminating point of its prosperity. The magnificence of the Flemish court during the entire period of its prosperity was such that no European monarch could equal or approach it. When the wife of Philippe-le-Bel of France visited Bruges at the beginning of the fourteenth century, so greatly was she impressed with the display of wealth and splendour, that she exclaimed, "There are hundreds here who have more the air of queens than myself." To such an extent was this extravagance ultimately carried, that Charles V. was obliged in the sixteenth century to repress it by severe sumptuary laws. In 1430, Philippe-le-Bon, Duke of Burgundy, instituted at Bruges the chivalric order of the Golden Fleece, a compliment to the town, no small portion of whose prosperity arose from its woollen trade. In the fourteenth and fifteenth centuries, Bruges was the chief emporium of the cities of the Hanseatic league. Merchants from every quarter of the world found here a ready market for their goods. The rich argosies of Venice and Genoa came laden with the valuable produce of the East; ships of every nation took in and discharged their cargoes at the quays; the warehouses were filled with bales of wool from England, and silk from Persia. Not the least famous of the manufactures was that of tapestry, in which the people of Bruges acquired great skill a century before the looms of Beauvais or the Gobelins were set up. The prosperity of Bruges was undiminished till it passed under the dominion of the house of Hapsburg. For a violation of some of their prerogatives, the inhabitants imprisoned the Archduke Maximilian. A terrible vengeance was inflicted upon the town for this outrage. Its trade was transferred to Antwerp, and its ruin was ultimately completed by the religious persecutions of the bloody Duke of Alva at the end of the sixteenth century. Such of the inhabitants as escaped with their lives fled to England and introduced into that country many of the arts and manufactures which they and their forefathers had cultivated for many generations with such success. The contrast between the Bruges of the fifteenth century and the Bruges of our own day is as striking as it is painful. The present condition of the town is such as amply to justify the description of Wordsworth:

> "In Bruges town is many a street Whence busy life hath fled, Where, without hurry, noiseless feet The grass-grown pavement tread."

The great circumference of the city, its numerous squares and streets, and the number and magnificence of its public buildings, all

attest its former importance; while its scanty population, the absence of commercial life and enterprise, and the general air of desolation in which everything is enveloped, bear witness to its present insignificance. Its trade has of late years, however, begun to Brumoy. rovive, and its great advantages in canal and railway communication, its spacious docks and excellent quays, and the great fertility of the surrounding country, may once more, perhaps, restore it to its high place among cities. Of the public buildings of Bruges the most remarkable are the Church of Notre Dame, containing a sculpture of the Virgin and Child, said to be by Michael Angelo, effigies in copper of Charles the Bold and Mary of Burgundy, who are buried in the church; the cathedral of St Sauveur, built of brick, but internally the handsomest church in Bruges, with some fine pictures by Hemling and Peter Porbus; the hospital of St John, a charitable institution, where sick persons are attended by the sœurs de la charité; and the Hôtel de Ville, a small but handsome edifice, in the niches of which were statues of the old counts of Flanders, destroyed by the French revolutionists in 1792. The belfry-tower in the great square is the most beautiful structure of the kind in Europe, and its chimes are the best in Belgium, where indeed all the chimes are good. It is still used as a convenient place from which the alarm can be communicated to all parts of the city in the case of fire, which is done during the day by a flag and at night by a lantern. In this same square is a house in which Charles II. resided during his exile from England. There is a convent of Béguins, and another of English Augustin nuns. The town is likewise well provided with the means of education. There is a medical school, to which is attached a museum of natural history and a botanical garden. For the higher departments of school training there is an excellent athenæum, annually subsidized by government. The Academy of Painting is in a very flourishing condition, and offers many advantages to the student, as instruction is given gratis in drawing and architecture. The charitable institutions of Bruges are both numerous and well organized. They are all the more necessary, as the number of persons in the city requiring support amounts to more than 5000. In the poor-house alone there is accommodation for nearly 600 individuals, and it is almost always completely filled. The most important manufacture in Bruges is that of lace, in which nearly one-seventh of the population is engaged. It is now, however, beginning to decline. The other manufactures consist of linens, woollen and cotton goods, soap, leather, and tobacco. There are also some small breweries and distilleries, and some dyeing and bleaching establishments. All these are, however, comparatively unimportant. The exports from Bruges comprise the products of the rich agricultural district that surrounds the town; the imports include metals, dyewoods, wines, cotton, and wool. Despite the number of canals, the inhabitants of Bruges are very ill supplied with water for domestic purposes; every house is accordingly provided with a tank or but to receive the rain that falls. The water collected in the public tanks is distributed through the city in pipes. Of the canals the largest is that to Ostend, wide and deep enough to allow vessels of 500 tons to pass up from the sea. The ramifications of these canals intersect the city in all directions, and are crossed by upwards of fifty bridges, whence the Flemish name of the town is derived. Pop. in 1838, 44,374; in 1846, 49,308; in 1851, 50,698.

BRUIN, or Bruyn, John DE, professor of natural philosophy and mathematics at Utrecht, was born at Gorcum in 1620. His skill in the dissection of animals was remarkable, and he was a skilful experimenter. He also made observations in astronomy. He published dissertations De vi altrice; De corporum gravitate et levitate; De cognitione Dei naturali; De lucis causa et origine, &c. In a dispute with Isaac Vossius, he wrote a letter, printed at Amsterdam in 1693, in which he criticises Vossius's book De Natura et Proprietate Lucis, and strenuously maintains the hypothesis of Descartes. He died in 1675, after he had been professor twenty-three years; and his funeral oration was pronounced by M. Grævis.

BRULLIOT, FRANZ, an engraver, and the author of a laborious work entitled Dictionnaire des Monogrammes, Chiffres, et Lettres Initiales des Graveurs, was born at Dusseldorf in 1780. On being appointed assistant-keeper of the royal collection of prints at Munich, he devoted himself to this valuable work, which appeared at Munich in 1817 in one 4to volume. He died of cholera in 1836.

BRUMOY, PIERRE, a learned Jesuit, born at Rouen in 1668, was early distinguished by his talents for the belleslettres. He was a man of estimable character, and beloved Brunel.

for his integrity and goodness of heart. He wrote many works; but his fame rests at present on his *Théâtre des Grecs*, which is a prose translation of the Greek dramatists, with an analysis of their merits, and dissertations on the Greek stage. He died at Paris in 1742.

BRUN, CHARLES LE. See LEBRUN.

Brun, or Brunn, Malte-Conrad, a celebrated modern geographer, was born at Thisted in Jutland, August 12, 1775. He was originally destined for the church, but his inclination led him strongly to literature and politics. When the French Revolution broke out, he advocated the principles of it so boldly, that he attracted the attention of the Danish government, and was obliged to retire to the island of Huen, which had once been the residence of Tycho Brahe. After an exile of two years he was allowed to return to Copenhagen, where he again signalized himself by the violence of his hostility against the government. Deeming it unsafe to await the vengeance of the authorities, he fled to Hamburg, where he learned that his works had been condemned and himself formally expelled the kingdom. From Hamburg he went to Paris, where he hoped that his political views would gain the favour of the first consul. Disappointed in this expectation, he devoted himself entirely to the study of geography and history. Along with Mentelle, the most popular French geographer of the day, he published the Geographie Mathématique, Physique, et Politique, in 16 vols. 8vo, 1803-5. Of this work, on which his fame partly rests, he contributed one-third. In 1806 he became joint editor of the Journal des Débats, for which he wrote many valuable papers, afterwards collected and republished by Nachet. In 1810 he published the first volume of his Précis de la Geographie Universelle, the last and most valuable volume of which did not appear till 1825. The intensity of his application had, meanwhile, exercised a most injurious influence on his health, which at last rapidly gave way. He died of apoplexy, December 14, 1826. Besides the works already mentioned, he wrote many others, poetical, scientific, and political.

BRUNCK, RICHARD FRANÇOIS PHILIPPE, an eminent French scholar, was born at Strasburg, 20th December 1729. He was educated at the Jesuits' college at Paris, but having early entered the public service, he soon forgot his Latin and Greek. At the age of thirty he returned to his native town and resumed his studies, paying especial attention to Greek. The nature of the office which he held put considerable sums of money at his disposal, which he expended in publishing editions of the Greek classics. The first work which he edited was the Anthologia Græca, in which his innovations on the established mode startled European scholars. For wherever it seemed to him that an obscure or difficult passage might be made intelligible and easy by a change of text, he did not scruple to make the necessary alterations, whether the new reading were supported by manuscript authority or not. With the assistance of Schweighæuser, then an unknown youth, he next brought out editions of the Greek dramatists, characterized by the same peculiarities as the Anthologia, and ultimately the Gnomici Poetæ Græci. In 1781 he published an edition of Virgil, for which he was pensioned by the French king. At the outbreak of the French Revolution, in which he took an active part, he lost his pension and was reduced to such extremities that he was obliged to sell a portion of his library. In 1802 his pension was restored to him, but too late to prevent the sale of the remainder of his books. He had brought out an edition of *Plautus* in 1788, and was in the act of republishing it when he died, June 12, 1803.

BRUNDUSIUM, or Brundisium. See Brindisi.

BRUNEL, SIR MARC ISAMBART, was born in 1769, at Haqueville, in Normandy. His family had for several centuries held a respectable station in the province, living as farmers and small landowners on the estate on which he was

born, and numbering among its members Nicholas Poussin, of whom France is so justly proud. He was educated at the seminary at Rouen, with the intention of his entering holy orders; but his predilection for the physical sciences was so strong, and his genius for mathematics and mechanics so decided, that, on the advice of the Superior of the establishment, he was removed, to follow a more congenial career. His father then destined him for the naval service, which he entered on the appointment of the Mareschal de Castries, the minister of marine, and made several voyages to the West Indies. In this position, although only in his fifteenth year, his mechanical talents developed themselves actively on many occasions, and he surprised his captain by the production of a sextant of his manufacture, with which he took his observations. On his return to France, in 1792, he found the Revolution at its height, and, like all who entertained royalist principles, was compelled to seek safety in emigration, which, with considerable difficulty, he accomplished, and found refuge in the United States of America, where, driven by necessity to the exercise of his talents as a means of support, he followed the bent of his inclination and became a civil engineer and architect. His first engagement was on the survey of a tract of land near Lake Erie; he then became engaged in cutting canals, and was employed to erect an arsenal and cannon foundry at New York, where he applied several new and ingenious machines. His highly ornamental design for the House of Assembly at Washington was rejected, as being inconsistent with the simplicity of a republic: he was, however, engaged to design and superintend the construction of Bowery Theatre, New York, since destroyed by fire; the roof of which was peculiar and original.

The idea of substituting machinery for manual labour in the making of ships' blocks had long occupied his mind; and, in 1799, having matured his plans, finding the United States unable to afford full occupation for his inventive genius, he determined on visiting England. Earl St Vincent was at that time at the head of the Admiralty, and after the usual delays and difficulties, which were ultimately overcome, chiefly through the powerful influence of his steady friend and patron Earl Spencer, and aided by the recommendation of Brigadier-General Sir Samuel Bentham, who at once perceived and appreciated the merit of the machines and the talent of the inventor, the system was adopted, and eventually the beautiful and effective machinery was erected, which has continued to the present time, without alteration, to produce nearly all the blocks used in the royal navy. The construction of these machines was intrusted to the late Mr Henry Maudslay, whom with true discrimination he selected for the purpose, and by whom he was ably assisted. beautiful simplicity of these machines, their perfect adaptation to their various purposes, and, notwithstanding the recent advances in mechanics, their continuing for nearly half a century in active work, without any improvements having ever been suggested, must rank them as among the most complete and ingenious pieces of mechanism ever invented.

A description of these well-known machines would be superfluous here; but it should be remarked, that in them are combined all the motions and functions since so universally applied to machines for working metals, the introduction of which into engine and machine factories has induced the substitution of machinery for manual labour, and has tended so essentially to secure for English machinery the deservedly high reputation which it has acquired.

The block machinery was completed in 1806, and it was estimated that the economy produced by it in the first year was about L.24,000, two-thirds of which sum were awarded to the ingenious inventor, who was soon after engaged by the government to erect extensive saw-mills, on improved principles, at Chatham and Woolwich; when he suggested modifications of the systems of stacking and seasoning tim-

Brunel. ber, which, it is understood, are, after this lapse of years, to be carried into effect. Some time previously, he invented the ingenious little machine for winding cotton-thread into balls, which, simple as it may at first sight appear, has exercised great influence in the extension of the cotton trade.

He found time also to invent an instrument for combining the use of several pens, for producing simultaneously a number of copies of a manuscript; a simple and portable copying machine; a contrivance for making the small boxes used by druggists, which had been previously imported in large quantities from Holland: a nail-making machine also occupied his attention; and he discovered the system of giving the efflorescent appearance to tinfoil, by which it was fitted for ornamental purposes.

Among other more important improvements, must be mentioned that of cutting veneers by circular saws of large diameter; and to that is mainly due the present extensive application of veneers of wood to ornamental furniture.

A short time before the termination of the war, he devised the system of making shoes by machinery; and, under the countenance of the Duke of York, the shoes so manufactured, in consequence of their strength, cheapness, and durability, were introduced for the use of the army; but at the peace in 1815, manual labour becoming cheaper, and the demand for military equipments having ceased, the machines were laid aside.

Steam navigation also attracted his attention, and he became deeply interested in establishing the Ramsgate steam vessels, which were among the first that plied effectively on the river Thames; and on board of them it is believed that the double engines were first used. About this period, after much labour and perseverance, he induced the Admiralty to permit the application of steam for towing vessels to sea, the practicability of which he had strenuously urged. The experiments were tried chiefly at his own expense, a small sum in aid having been promised, but it was eventually withdrawn before the completion of the trials; the Admiralty considering the attempt "too chimerical to be seriously entertained."

He introduced various improvements in the steam-engine, and for nearly ten years persevered in the attempt to use liquefied gases as the source of motive power, in which he was ably assisted by his son. The necessary experiments were most laborious, and needed all the persevering energy and resources of a mind determined not to be foiled: in spite, however, of his efforts, after a great sacrifice of time and money the plan was abandoned.

He furnished designs, also, for some suspension bridges, which, being for peculiar localities, exposed to the violence of hurricanes in the Isle of Bourbon, exhibited, as usual, some original features.

The whole power of his mind, however, was soon to be concentrated on one great object,—the construction of the tunnel for traversing from shore to shore beneath the bed of the river Thames. It is said that the original idea occurred to him, as applied to the Neva at St Petersburg, in order to avoid the inconvenience arising from the floating ice; a plan which he offered to the emperor Alexander, on

the occasion of his visit to this country in 1814.

Undismayed by the previous signal failures in the attempt to tunnel beneath the Thames, Brunel, confident in his own powers, persevered in his efforts, and in 1824, under the auspices of F. M. the Duke of Wellington, who always entertained a favourable view of the practicability of the scheme, a company was formed for its execution; and after numerous accidents, and suspensions of the works, accounts of which were frequently laid by Sir Isambart before the Institution of Civil Engineers, and are recorded in the

Minutes of Proceedings,1 this great and novel undertaking was successfully accomplished, and opened to the public in the year 1843.

Brunel.

leschi

Brunn.

In the prosecution of this work he received great assistance from his son, Mr I. K. Brunel, V. P., and in a scientific point of view, the construction of the tunnel will be regarded as displaying, at the same time, the highest professional ability, an amount of energy and skill rarely exceeded, and a fertility of invention and resources, under what were deemed insurmountable difficulties, which will secure to the memory of Sir Isambart Brunel a high position among the engineers of this country.

He received the order of the Légion d'Honneur in 1829, and the honour of knighthood in 1841. He was a corresponding member of the French Institute, and a fellow of the Royal Society, and joined the Institution of Civil Engineers as a member in the year 1823, constantly attending all the meetings, giving accounts of the progress of his works, bringing forward subjects, taking part in the discussions, serving ca. the council for some years, and aiding in the advancement of the society by every means in his power.

He was unaffected and simple in his habits, and possessed indomitable courage, perseverance and industry; whilst his general benevolence of disposition constantly prompted him to the kindest acts, as it did to the forgiveness of in-jury or slight offered to him. His labours had so seriously impaired his health, that for some years after the completion of the tunnel he was unable to mix in active life, and he expired on the 12th of December 1849, in his 81st year, after a long illness, as much regretted as he had been loved and respected by all who knew him.

BRUNELLESCHI, FILIPPO, the restorer of ancient architecture in Italy, was the son of a notary of Florence, where he was born in 1377. He early adopted architecture as a profession, and went to Rome with Donatello to pursue his studies. The splendid edifices with which he adorned his native town gained him much fame throughout Italy; and the pope for the time being, Eugene IV., sent for him to the court to draw up designs and assist him with his advice on professional matters. He was the original architect of the Pitti Palace, and of the still more magnificent palaces of the Strozzi and Riccardi on the opposite bank of the Arno. He died in 1444.

BRUNI, LEONARDO, author of the History of Florence, was an eminent scholar of the fifteenth century. He was born at Arezzo in 1369, and is generally known as L. Aretino. He was secretary to the papal chancery under Innocent VII. and John XXII. His history of Florence comes down to 1404. Bruni died at Florence in 1447, and was buried at the expense of the state in Sta. Croce, where his laurelled statue is still to be seen.

BRUNN, a circle in the Austrian province of Moravia, extending over 4437 square miles, and having in 1851 an estimated population of 874,528. The northern part of the circle is a portion of the Moravian mountain range, which abounds in mineral wealth. Between the mountains the land is highly productive in corn and cattle. It is the chief manufacturing district of the imperial dominions, and produces good woollen, linen, and cotton goods of all descriptions.

Brunn, the capital of the above circle, as well as of the province of Moravia, stands between and on the declivities of two hills at the confluence of the Schwarza and the Zwittawa, 69 miles north of Vienna, and 115 miles W.S.W. of Prague, with both of which it is connected by railway. Lat. 49. 11. 28. N. Long. 16. 36. 35. E. It is surrounded. by walls and trenches, and possesses numerous fine buildings; but the streets are narrow and crooked, though well paved. The citadel of Spielberg, standing on the hill of the

¹ Vide Minutes of Proceedings, Inst. C.E., vol. i. (1837) p. 32; vol. i. (1838) pp. 5, 23, 41, and 46; vol. i. (1839) p. 44; vol. i. (1840). p. 85; and vol. ii. (1843) pp. 29 and 80.

same name west of the town, has been used, since its fortifications were destroyed by the French, as a state prison, and Brunswick here Silvio Pellico was confined for eight years. Among the public buildings are the cathedral, the fine Gothic church of St James, built in 1215, with a tower 276 feet high, the barracks, city-hall, theatre, bishop's palace, governor's house, park, and public gardens. Brunn is the seat of the chief legal and military courts of the province, of a bishop, and a Protestant consistory; and has a philosophical institution, theological seminary, gymnasium, several academies, schools, and learned societies, museum, botanic garden, agricultural society, infirmary, orphan and lunatic asylums, deaf-mute institution, &c. Its manufactures of woollen goods are the most extensive in the Austrian dominions. It has also considerable manufactures of silk and cotton goods, leather, tobacco, &c., and is the centre of a large trade. Pop. 42,000, exclusive of the military, who may amount to 3000.

> BRUNO, the founder of the Carthusian order of monks was born at Cologne about the year 1030. He was educated at Cologne, and afterwards at Rheims, where he became so distinguished by his learning and piety, that he was appointed to superintend the studies in all the chief schools of the diocese. Among his pupils, many afterwards became distinguished, and in the number was Pope Urban II. In 1084, after some disputes with Manasses, the archbishop of Rheims, he retired into the desert of Chartreuse, where, with six companions, he built an oratory, with cells at a little distance from each other. After a residence of six years in this spot, he went to Rome, where his old pupil Urban_II., pressed him to accept the archbishopric of Reggio. He declined this honour, and withdrew into the solitudes of Calabria, where he remained with his disciples till his death in 1101. He wrote treatises on the Psalms and some of the Epistles of St Paul, but none of these works have descended to our times.

Bruno, Giordano, was born at Nola, in the kingdom of Naples. About the year 1582 he began to call in question some of the tenets of the Romish church, which occasioned his retiring to Geneva; but after residing there for two years, his open aversion for Calvinism occasioned his expulsion from that city. Having staid some time at Lyons, Toulouse, and Paris, he came to London, and continued two years in the house of M. Castelnau, the French ambassador. He was well received by Queen Elizabeth and the court, numbering among his friends Sir Philip Sydney and Sir Fulk Greville. With these and some others Bruno had frequent meetings; but as they treated of subjects of a very delicate nature, which could not suit the taste or capacity of everybody, none but select persons were admitted. Bruno's Spaccio della Bestia Trionfante was printed in 8vo, 1584, and dedicated to Sir Philip Sydney. From England he went to Wittemberg, and thence to Prague, where he printed several tracts, in which he openly avowed atheistical principles. After visiting some other towns in Germany, he made a tour to Venice, where he was apprehended by order of the inquisition, sent to Rome, tried, and condemned; and having refused to retract, he was burnt at the stake, Feb. 1600.

BRUNSWICK, DUCHY OF (German Braunschweig), a state of Northern Germany, consisting of three larger and several smaller portions of territory, lying principally between Lat. 51. 38. and 52. 28. N., and Long. 9. 20. and The principal part containing the cities of Brunswick, Wolfenbüttel, Helmstedt, &c., is situated between Hanover and Prussia, to the S.E. of the former. Its surface is diversified with hills and plains, with occasional patches of forest. That part containing Holzminden, Gandersheim, &c., extends eastward from the Weser to Goslar, and is intersected by branches of the Hartz mountains. That containing Blankenburg, &c., lies to the S.E. of the

two former, between Prussia, Anhalt, and Hanover, and is Brunswick. traversed by the Hartz mountain range. Of the smaller portions, some are in Hanover and others in Prussia.

Brunswick has an area of 1524 English square miles, and is divided into 6 circles, comprehending 12 cities, 16 market-towns, and 440 villages. The population, according to government returns, was in 1834, 253,232, and in 1846, 269,228; and according to the Almanach de Gotha, was in December 1852, 270,825. Of these about 265,000 are Protestants, the rest being chiefly Roman Catholics and

Brunswick has also mediatized possessions in Prussian Silesia, viz., the principality of Oels, with the lordship of Medzibor, the territory of Plomnitz in the government of Breslau, and the lordship of Gutentag in the government of Oppeln. The climate resembles that of the neighbouring territories of Hanover, and in the higher parts is rigorous. A portion of the Hartz chain is common to it with Hanover, and hence called the Communion Hartz. The highest point of the Hartz mountains in Brunswick is the Wormberg, 3230 feet in height. The principal rivers by which it is watered are the Ocker, Weser, Aller, and Leine. The lower parts are generally fertile and well cultivated; but the higher are mostly covered with extensive forests of fir, oak, and beech. The following is the proportion per cent. of the various kinds of surface in the duchy, viz., arable, 32.66; garden, 1.88; meadow, 4.52; pasture, 22.82; water, 0.25; wood, 31.82; towns, villages, and roads, 6.05. Agricultural and pastoral pursuits constitute the principal employment of the inhabitants. In 1848 the duchy, with the exception of the towns of Brunswick and Wolfenbüttel, contained 24,676 horses, 68,641 cattle, 365,291 sheep, 47,737 swine, 17,975 goats, and 72,978 geese. The principal products of the country are grain, flax, hops, tobacco, and fruits. Mining is extensively carried on in the Hartz mountains, the products of which are very valuable, consisting of copper, lead, iron, gold, silver, sulphur, coal, salt, and alum. The manufactures, which are very inconsiderable, consist chiefly of linen and woollen goods, leather, beer, paper, and tobacco. An active trade, however, is carried on by means of the railways connecting it with Hanover, Magdeburg, and Neustadt.

The government is an hereditary monarchy, with a legislative chamber consisting of 48 members, of whom 10 are chosen from the nobility, 12 from the towns, 10 from the rural districts, and 16 from the general population. They hold office for six years, one-half going out trienni-The educational institutions are an ecclesiastical seminary, a higher humanity and a mercantile institution, an anatomical and surgical college, 5 gymnasia, a normal seminary, 21 burgher and about 400 village schools.

Brunswick occupies the thirteenth place in the German confederation, has two votes in the plenum assembly, and contributes 2096 men to the federal army. The revenue and expenditure for the triennial financial period 1852-54, were each fixed at 4,052,500 thalers; and the public debt on 1st September 1845, was 6,444,349 thalers. The effective force consists of 2702 men in time of peace, and 5359 during war.

In the earlier part of the middle ages, Brunswick, with Hanover, formed part of the ancient Saxony. The mora

Brunswick immediate ancestor of the house of Brunswick was Henry the Lion, who in the twelfth century held the united duchies of Bavaria and Saxony; but having refused to aid the Emperor Frederic Barbarossa in his wars with the pope, he was by decree of the diet in 1180, deprived of both duchies, and only left the possession of his allodial domains of Brunswick and Lüneburg. These possessions were, on the death of Ernest the Confessor in 1546, divided between his two sons; the elder, or rather his son Augustus, receiving Brunswick-Wolfenbüttel, or Brunswick, and the younger Brunswick-Lüneburg, or Hanover. The ducal residence, which had hitherto been at Wolfenbüttel, was in 1754 removed to Brunswick by Duke Charles. His successor, Duke Charles William Ferdinand, married Augusta, daughter of George III. of England. He commanded the Prussian troops at the battle of Auerstädt in 1806, where he was severely wounded and soon after died. His possessions were immediately seized by the conqueror, and formed part of the kingdom of Westphalia till 1813. After the battle of Leipzig, the duchy was restored to its rightful possessor, Frederic-William, youngest son of the preceding duke. This prince fell at the head of his troops at Quatre Bras, and was succeeded by Charles Frederic, the elder of his two sons, who, being at that time a minor, was placed under the tutelage of George IV. of England, then prince regent. The duke entered on the exercise of his authority in October 1823; but in consequence of a revolution in 1830, was obliged to abdicate in favour of his brother William, the present duke. Treaties of mutual inheritance exist between the houses of Hanover and Brunswick, and should the present duke and his brother-both of whom are still unmarried—die without issue, the duchy will pass to the house of Hanover. See GERMANY and HANOVER.

Brunswick, the capital of the above duchy, is situated on the Ocker, 35 miles E.S.E. of Hanover, and 47 W.N.W. of Magdeburg, with both of which, as well as with Neustadt, it is connected by railways. Lat. 52. 16. N. Long. 10. 32. E. It is said to have been founded about 868 by Bruno, from whom it was called Bruno Vicus. It was afterwards enlarged and adorned by Henry the Lion, and soon became one of the most important cities of Northern Germany. In the thirteenth century it ranked among the first cities of the Hanseatic league. After this, however, it declined in consequence of the many divisions of territory among the branches of the reigning house, the jealousy of the neighbouring states, the thirty years' war, and more recently from the French occupation. The two celebrated fairs held annually in February and August, and which formerly attracted many thousands of strangers, only bring together a few hundreds. It is still, however, a place of considerable importance. The city is of an antiquated appearance, but has several fine new streets, and the old fortifications have been converted into agreeable promenades. Among the fine edifices are the new palace, a handsome Greek structure occupying the site of the former ducal residence, which was burned in 1830; the cathedral of St Blaize, built by Henry the Lion, the town-house, St Andreas church, with a spire 318 feet high, St Catherine's church, the museum, opera-house, mint, &c.; with several fountains and monuments, one of which, in memory of the late duke who was slain at Quatre Bras, is 60 feet high. It has several educational and charitable institutions, and a considerable trade. In December 1852 it had, exclusive of the military, 37,694 persons, 7508 families, and 3194 inhabited houses. Including the military in the garrison, it has a population of about 40,000.

BRUNSWICE, a post-town of Maine, in Cumberland county, United States, on the Androscoggin river. Long. 69. 55. W. Lat. 43.53. N. It is the seat of Bowdoin College and a medical school, and has a considerable trade in timber. Pop. 4976.

There is also a small seaport of this name, capital of the county of Glynn, state of Georgia, on the river Turtle, 168 miles S.E. of Mill Edgeville. Its harbour is spacious and safe, and accessible to vessels drawing not more than 13 feet at low tide.

BRUNTISLAND. See BURNTISLAND. BRUSH, a well-known implement used for various purposes, such as clearing away dust, smoothing or polishing surfaces, &c. Ordinary brushes are made of small bundles of bristles or hairs, secured at one end by a ligature; and this knotted end is set with glue or cement into a wooden stock, which is shaped and pierced with holes for the purpose. A patent was obtained in 1830 for several improvements in the construction of brushes. Of these the chief feature consists in pressing the knotted ends of the bundles into wedge-shaped grooves in the stock; after which they may be further secured by being covered with a ferule of metal or a wooden pallet. Small brushes are generally made by doubling the hair or bristle, and bringing it through the holes in the stock, by means of a thread or wire which is engaged in the fold, and serves to secure it; after which

the bristles are cut even. Brushes vary greatly in their size, form, and materials of construction, according to the several uses to which they are applied. Silversmiths and other artificers use a wirebrush for scrubbing silver, copper, or brass, previous to gilding. In some countries the bamboo or other fibrous plant is converted into a kind of brush, for painting and similar purposes, by fretting the extremity by beating, and then binding it firmly above the part so treated.

Brush, among sportsmen, the tail of a fox.

Brush-Wheels, wheels which act on each other by means of bristles or brushes fixed on their circumference; or simply by the friction of their plane surfaces, in which case the surfaces in contact are usually covered with hempen or leathern belts, and are kept closely pressed together by a spring. Brush-wheels are used only in very light machinery.

BRUSSELS (French, Bruxelles; Flemish, Brussel; German, Brissel,) capital of Belgium and of the province of Brabant, is situated on the small river Senne, about 50 miles from the sea, in Lat. 50. 51. N. Long. 4. 20. E. It lies in the midst of a beautiful and fertile country, and is picturesquely built on the top and sides of a hill, which slope down to the Senne. The general contour of Brussels is triangular, and is well defined by the boulevards, which occupy the site of the old fortifications, and completely encircle the town. The history of Brussels, though it does not date from so remote a period as that of other Flemish cities, can still be clearly traced back to the seventh century. At that time St Géry, bishop of Cambray, built a chapel on one of the small islands in the river, and by his eloquence and piety soon attracted a large congregation. The site being well adapted for building, a hamlet soon sprung up, which speedily became a town, which in the eleventh century was walled in and fortified. Though in commercial importance it did not at this time equal Ghent or Bruges, its traffic in cloth was very considerable, and its workers in iron and steel were not surpassed by any in Europe. In the fourteenth century the various trades were incorporated into guilds, who regulated the taxes and other financial matters of the city, and drew up a code of municipal laws, in which the principle of trial by jury was admitted. These arrangements had scarcely been completed, when a dreadful fire visited the city and nearly burnt it to the ground. At the end of this century a general persecution of the Jews in Europe took place. In Brussels, many of them were put to death, and the value of the confiscated property amounted to upwards of half a million sterling. At the beginning of the fifteenth century, Brussels was again visited by a destructive fire, from the effects of which it speedily recovered by the patriotic exertions of its rulers, and soon became more

Brussels. distinguished than ever as a seat of learning, art, and science. In 1489, and again in 1587, it was visited by the plague, which, on the former of these occasions, carried off many thousands of the inhabitants. Its horrors were further enhanced by the ensuing famine, which lasted for four consecutive years. Brussels was highly favoured by Charles V., who often resided there, and who finally abdicated his royal and imperial throne there in 1555. In 1567, the infamous Duke of Alva, acting under the orders of Philip II., attempted to establish the inquisition in Brussels, and oppressed the inhabitants otherwise so cruelly, that a rebellion ensued in the low countries, which resulted in the independence of the United Province, after much of the best blood of the land had been shed in the struggle. Amongst others who fell in the cause of freedom were the Counts Egmont and Horn. In 1598, Brussels passed into the dominion of the Austrians, and soon began once more to prosper. At the end of the seventeenth century, the French under Marshal Villeroy besieged Brussels, but were obliged to retire after doing much damage to the town; and in 1706 the city opened its gates to Marlborough. In 1746 it was again besieged by the French under Marshal Saxe, and after a siege of three weeks was obliged to surrender. In 1792 it fell into the hands of General Dumouriez, who being soon after defeated at Louvain, evacuated Brussels for a while, but again entered it in 1794. From that year till 1814, it remained in the possession of the French, as capital of the department of the Dyle. On the fall of Napoleon, Belgium and Holland were united into one kingdom under William of Nassau, and Brussels was the seat of government alternately with the Hague. In 1830, however, after a sanguinary conflict of three days, the Belgians declared their independence; and erecting their state into a separate kingdom, offered the crown to Leopold of Saxe-Cobourg, whose long and peaceful reign has greatly contributed to develop the resources of the country.

Brussels may be considered to consist of two parts, each presenting characteristics peculiar to itself. The upper part of the city is dry and healthy, and contains a very large number of handsome buildings, both public and private. The lower part is the more ancient and interesting of the two, but is damp, and in summer unhealthy, from the exhalations of the river, and the numerous canals which receive the sewerage of the town. In the former are situated nearly all the public offices, the royal palace, the chamber of deputies, the residence of the foreign representatives, and the principal hotels. In the latter are the Hôtel de Ville, and some of the best remains of the old Gothic architecture, while nearly all the trade and commerce of the town are carried on there. The facilities for commerce are, indeed, very considerable. Though the Senne is not navigable itself, it supplies water to some of the numerous canals that intersect the lower portion of the city. By these canals Brussels communicates with the great Belgic cities, Mechlin, Ghent, Bruges, and Antwerp, on the north, and with Charleroi on the south. It further enjoys the advantage of railway communication with France and Germany, and the chief towns of the Belgic dominions.

The total number of streets in Brussels is about 250, containing in all nearly 15,000 houses. These are, for the most part, well paved, well lighted, and abundantly supplied with excellent water. There are ten wells in the town, besides innumerable fountains and pumps. Some of the fountains are handsomely ornamented with sculptures in stone and bronze. Of these the best are Les Fontaines des Fleuves in the Hôtel de Ville; La Fontaine de Minerve in one of the great squares, and the Mannekin-pis behind the Hôtel de Ville. The safety of this last fountain is watched over with the most jealous care by the municipality of Brussels. Though gas is abundant and cheap at Brussels, some of the more inaccessible streets are still lighted up with oil-lamps. Some of the

streets are macadamized, but the majority of them are cause- Brussels. wayed, while the trottoirs are either flagged or paved with 'flint-stones. In the new town some of the streets are remarkably handsome; and as there is a considerable number of shops and cafés after the manner of Paris, they form the chief promenades of the inhabitants. In the old town they are for the most part dull and sombre. There are fourteen squares in Brussels, many of which are used as market places. Of these the largest are the Place du Grand Sablon, the Place Royale, and the Grand Place before the Hôtel de Ville. In this latter square the Counts Egmont and Horn were beheaded in 1568, by orders of the Duke of Alva, who surveyed their execution from the windows of the Brood-Huys (bread-house), a remarkable specimen of Gothic architecture still extant. In the Place de la Monnaie are the mint, the exchange, and the great theatre. In the Place des Martyrs, the heroes who fell in the Revolution of 1830 are interred. In the upper town is the parc, a fashionable promenade in summer. It covers an area of about 14 acres, and is beautifully laid out with walks, adorned at moderate distances with groups of sculpture; and as the trees with which it is planted shade it from the sun, the grass is always fresh and green. In the lower town is the Allée Verte, an equally fashionable promenade, parallel with the Mechlin canal, with a triple row of linden trees on either side. the public buildings of Brussels, the most remarkable are the cathedral church of St Michel et Ste Gudule, and the Hôtel de Ville. The cathedral was built in 1010, and in it was held the first chapter of the order of the Golden Fleece in 1535. It contains a remarkable pulpit, and some splendid specimens of stained glass. In one of the chapels are deposited the Miraculous Wafers, which at the beginning of the fifteenth century are said to have been stolen from the altar by the Jews, at that time a numerous and wealthy class in Brussels. Not content with the sacrilege itself, they are said to have perpetrated it on a Good Friday. The stolen wafers were carried to the Jewish synagogue, and there subjected to every possible insult, till at length one Jew, more impious than his fellows, put his knife into the holy bread. Thereupon it is said that jets of blood spouted forth from the wound, and the perpetrators of the sacrilege were at the same time struck down insensible. One of their number, shocked at the incident, informed against the rest, and furnished the government with an admirable excuse for plundering and oppressing the wealthy and hated Israelites. To commemorate the detection and punishment of this sacrilege, an annual solemn procession is held at Brussels, on which occasion the identical wafers in question are exposed to the gaze of the superstitious multitudes. From the towers of the cathedral a fine view of the surrounding country may be obtained. The Hôtel de Ville was built in 1400. It is profusely ornamented, and its tower, which does not rise from the centre of the front, but from a point much nearer the left corner of the edifice, is 360 feet in height, and commands an extensive view of the surrounding country.

The other public buildings of Brussels are for the most part handsome but quite uninteresting edifices. The principal hospitals of the town are those of St Peter and St John, which are both admirably managed, and contain together about 1000 beds. The patients are waited upon by the sisters of charity. As in all the large Belgic towns, there is a convent of Béguins, which formerly numbered 1000 nuns; there are also two other nunneries. As the English residents in Brussels are very numerous, there are several Protestant churches. The mass of the native population are bigoted Catholics, but the king is a Lutheran, and attends divine service in his private chapel. The Jews have a synagogue at Brussels, and hold their grand consistory there. The number of charities in Brussels is very great; of these the most important are the Foundling Hospital, in which there are about 2000 inmates; the Orphan Asylum, in which there are nearly 200; and the Société Philantropique, whose object is to prevent mendicity. There are besides numerous alms-houses, which annually give relief to about 35,000 persons. Some of these establishments are supported entirely by subscripBrute.

tion; others of them are subsidized by government. Great attention is paid to the education of poor children, of whom about 6000 are annually taught at an expense of about L.1500. The total number of scholars in the different schools of Brussels is about 10,000. There are also a Lancasterian school, and many public and private academies. The number of students at the Free University of Brussels now amounts to nearly 400. Of students at the Royal Athenæum the number is 500. There is also a well conducted veterinary and agricultural school, attended by about 250 students. Some of the societies of Brussels are very celebrated. The Royal Society was founded in 1769. The geographical establishment of Vandermaelen, instituted in 1830, is in a flourishing condition. The botanical garden is one of the best in Europe. The Palais des Beaux Arts contains an admirable museum of natural history, and an extensive and valuable collection of books and manuscripts. The number of books is 180,000, of which 2000 belong to the fifteenth century. The number of MSS. is 19,668, many of which are beautifully illuminated. The annual increase of the library is estimated at 3000 The public is admitted to read in the library from 10 A.M. to 3 P.M. daily, except on Sundays and holidays and during the vacation. The number who annually avail themselves of this privilege is 3000. Eminent literary men and others are sometimes allowed to take books home, but the number to whom this privilege is conceded never exceeds 100 annually. There are about 50 printing presses in constant operation in Brussels, a large number of which are engaged in the republication of standard works that ap-Various attempts have been made by the French pear in France. government of late to put down this practice so injurious to the interests of French authors, but no definite arrangement has hitherto been concluded.

The principal manufactures of Brussels are those of lace and tulle, carpets, linen and cotton fabrics, jewellery, and articles of vertu. The most remarkable of these is that of lace. The finer sorts of flax used in the manufacture cost from L.12 to L.16 sterling per lb. An English yard of this lace costs L.8. The persons who spin the thread work in rooms almost completely darkened, and are thus compelled to concentrate their attention; and the thread spun in this way is said to be finer and more delicate than any that has hitherto been produced by other means. Excellent carriages are made in Brussels two-thirds cheaper than those of England, but inferior to them in quality.

In 1837, the population of Brussels was 104,265; in 1846, 123,874; in 1849, 138,189; and in 1850, 142,289.

BRUTE, a general name for all animals except mankind. Among brutes the monkey kind bear the nearest resemblance to man, both in the external shape and internal structure, but more in the former than in the latter. In the monkey kind the highest and the nearest approach to the likeness of man is the orang-outang, or *Homo Sylvestris*. (See Mammalia.) The structure and economy of brutes make the object of what is called Comparative Anatomy. (See Anatomy, Comparative.)

Philosophers have been much puzzled about the essential characteristics of brutes, by which they may be distinguished from man. Some define a brute to be an animal not risible, or a living creature incapable of laughter; others call them *mute animals*. The Peripatetics allowed them a sensitive power, but denied them a rational one. The Platonists allowed them reason and understanding, though in a degree less pure and refined than that of men. Lactantius allows to brutes everything which men possess, except a sense of religion; and even this has been ascribed to them by some sceptics. Descartes maintained that brutes are mere animate machines, absolutely destitute not only of reason, but of all thought and perception, and that all their actions are only consequences of the exquisite mechanism of their bodies. This system, however, is much older than Descartes: it was borrowed by him from Gomez Pereira, a Spanish physician, who employed thirty years in composing a treatise which he entitled Antoniana Margarita, from the Christian names of his father and mother. It was published in 1554; but as his opinion had not the honour of gaining partizans, nor even of being refuted, it died with him. Even Pereira seems not to have been the inventor of this notion, something like it having been held by several of the ancients, as we find from Plutarch and St Augustin. Others, who rejected the Cartesian hypothesis, have maintained that brutes are endowed with a soul essentially inferior to that of men; and to this soul some have allowed immortality, others not.

And, lastly, in a treatise published by Bougeant, a French Jesuit, entitled Amusement Philosophique sur le Langage des Bêtes, he affirms that they are animated by evil spirits or devils.

The opinion of Descartes was probably invented, or at least adopted, by him, to refute two great objections: one against the immortality of the souls of brutes, if they were allowed to have any; the other against the goodness of God, in suffering creatures who had never sinned to be subjected to so many miseries. The arguments in favour of it may be stated as follow: 1. It is certain that a number of human actions are merely mechanical, because they are done imperceptibly to the agent, and without any direction from the will, which are to be ascribed to the impression of objects and the primordial disposition of the machine, wherein the influence of the soul has no share; of which number are all habits of the body acquired from the reiteration of certain actions. In all such circumstances human beings are no better than automata. 2. There are some natural movements so involuntary that we cannot restrain them; for example, that admirable mechanism ever on the watch to preserve an equilibrium when we stoop, bend, or incline, our bodies in any way, and when we walk upon a narrow plank. 3. The natural liking for, and antipathy against, certain objects, which in children precede the power of knowing and discriminating them, and which sometimes in grown persons trumph over all the efforts of reason, are all phenomena to be accounted for from the wonderful mechanism of the body, and are so many cogent proofs of that irresistible influence which objects have on the human frame. 4. Every one knows how much our passions depend on the degree of motion into which the blood is put, and the reciprocal impressions caused by the animal spirits between the heart and brain, which are so closely connected by their nerves; and if such effects may be produced by such simple mechanical means as the mere increase of motion in the blood, without any direction of the will, we are not to wonder at the actions of brutes being the effects only of a refined mechanism, without thought or perception. 5. A further proof will arise from a consideration of the many wonderful effects which even the ingenuity of men has contrived to bring about by mechanical means. Now it is not to be questioned but that the mechanism of the body of the meanest animal infinitely surpasses that of any machine; and what can be the consequence of this, but that the actions of that animal must be proportionably more surprising than those of the finest automaton. (See Androides and AUTOMATON.)

The above is a short abstract of all the arguments that are brought in favour of the Cartesian system; but they are evidently very far from being conclusive. They are deficient, in the first place, because, though we allow them in the utmost extent the Cartesians themselves can desire, they prove only the possibility of brutes being inanimate, and that the power of God actually could produce such and such actions from inanimate machines; but that he has actually done so, they have not the least tendency to prove. In the second place, the Cartesian argument is insufficient, because it has no limits, and knows not where to stop. By the same method of arguing every man might prove his neighbour to be an inanimate machine; for though every individual be conscious of his own thoughts, he is not of those of his neighbours; and it no more exceeds the power of God to cause an inanimate machine to perform the actions of a man than those of a beast. Neither are the two objections which the hypothesis is calculated to answer to be at all admitted as arguments in its favour. They are, 1. That if we allow brutes to have souls, they must be immaterial, and consequently immortal; and, 2. It seems a contradiction to the goodness of God to think

quences to us, though it should be granted; and if it is supposed that the brute creatures are really immortal, the

As to a positive proof on the other side, namely, that brutes are really endowed with sensation and consciousness, there is undoubtedly the same evidence for the sensibility of brutes that there is for that of mankind. We see brutes avoid pain as much as we do; and we likewise see them seek for pleasure, and express their happiness in the enjoyment of certain things by signs not at all equivocal. Therefore, though we grant the possibility of all this being the effect of mere mechanism, yet, as we are conscious that in ourselves similar effects are produced by a sentient principle, we have all the reason in the world to conclude that in brutes they are likewise derived from a prinsee that a mechanism of this kind does take place in some part of nature, we have no reason to suppose it in any. As to those actions of the human body in which it seems to move spontaneously, like an automaton, without the direction of the mind or will, it is almost superfluous to observe, that they were not performed in this manner originally, but required very great exertions of the will and perform them easily; so that from these nothing can be inferred. Add to this, that divine revelation sets forth to us in many places the brute creation as objects of mercy, which could not be done without the highest absurdity, if as well as we.

sation as well as we, though of an inferior nature to ours. Great disputes, however, have arisen on this subject, some maintaining that the soul of brutes is merely sensitive, wherefore. In numberless instances, needless to be mentioned here, but which will readily occur to every reader, capable of education in the same degree that men are, neither are the rational exertions of beasts at all to be remarkable instance of this is in the use of the element of fire. The most savage nations have known how to make this element subservient to their purposes; or if some have been found who have been entirely ignorant of its existence, they have quickly learned its uses on seeing it employed by others; but though many of the brute creatures are delighted with warmth, and have opportunities every day of seeing how fire is supplied with fuel, and thereby preserved, it never was known that one of them attempted to preserve a fire by this means. This shows a strange defect of rationality, unaccountable upon any other tion is still, with regard to them, the primary effect of the

Brute. that he should subject innocent creatures to such a mul- supposition than that the soul or sentient principle of brutes Brute. titude of evils as we see the brute creation endure in this is somehow or other inferior in its nature to that of man; world. The first of these is productive of no bad conse- but still it is a sentient principle, capable of perceptions as quick as our own, and in many instances much more so.

Father Bougeant supports his opinion of the spirits of second objection vanishes, because, in the enjoyment of brute creatures being devils in the following manner:endless felicity, all temporary afflictions, how severe soever, must be swallowed up as though they had never been. Having proved at large that beasts naturally have understanding, he says, "Reason naturally inclines us to believe that beasts have a spiritual soul; and the only thing that opposes this sentiment is the consequences that might be inferred from it. If brutes have a soul, that soul must be either matter or spirit; it must be one of the two, and yet you dare affirm neither. You dare not say it is matter, because you must then necessarily suppose matter to be capable of thinking; nor will you say that it is spirit, this opinion bringing with it consequences contrary to the principles of religion; and this, among others, that man would differ from beasts only by the degrees of plus and minus, which would demolish the very foundation of all religion. Therefore, if I can elude all these conseciple of sensation, especially seeing we know of no kind quences; if I can assign to beasts a spiritual soul without of mechanism in any other part of nature which produces striking at the doctrines of religion, it is evident that my any thing like the effects just mentioned; and until we system, being moreover the most agreeable to reason, is the only warrantable hypothesis. Now I shall, and can do it, with the greatest ease imaginable. I even have means, by the same method, to explain many very obscure passages in the holy Scripture, and to resolve some very great difficulties which are not well confuted. This we shall unfold in a more particular manner.

"Religion teaches us that the devils, from the very intellectual faculty before the body could be brought to moment they had sinned, were reprobate, and that they were doomed to burn for ever in hell; but the church has not yet determined whether they do actually endure the torments to which they are condemned. It may then be thought that they do not yet suffer them, and that the exethey were not really capable of feeling pleasure and pain cution of the verdict brought against them is reserved for the day of the final judgment. Now, what I pretend to infer The most rational opposers of the Cartesian scheme from hence is, that, till doomsday comes, God, in order maintain that brutes are endowed with a principle of sen- not to suffer so many legions of reprobate spirits to be of no use, has distributed them through the several spaces of the world, to serve the designs of his providence, and make his omnipotence to appear. Some continuing in and that they are altogether destitute of reflection and their natural state, busy themselves in tempting men, in understanding; others, that they not only reason, but seducing and tormenting them, either immediately, as make a better use of it than men do. That the brutes Job's devil, and those that lay hold of human bodies, or are endowed only with sensation, and totally destitute of by the ministry of sorcerers or phantoms. These wicked all power of reflection, or even reasoning, is what can by spirits are those whom the Scripture calls the powers of no means be maintained on good grounds; neither can it darkness, or the powers of the air. God, with the others, be asserted that they act entirely from instinct or a blind makes millions of beasts of all kinds, which serve for the propensity to certain things without knowing why or uses of men, which fill the universe, and cause the wisdom and omnipotence of the Creator to be admired. By that means I can easily conceive, on the one hand, how it is evident that education will get the better of many of the devils can tempt us; and, on the other, how beasts the natural instincts of brutes, which could never be the can think, know, have sentiments, and a spiritual soul, case were they absolutely incapable of reasoning. On the without any way striking at the doctrines of religion. I other hand, it is equally certain that they are by no means am no longer surprised to see them have forecast, memory, and judgment. I should rather have occasion to wonder at their having no more, since their soul very compared even with those of the meanest savages. One likely is more perfect than ours. But I discover the reason of this; it is because, in beasts as well as in ourselves, the operations of the mind are dependent on the material organs of the machine to which it is united; and those organs being grosser and less perfect than in us, it follows that the knowledge, the thoughts, and the other spiritual operations of the beasts, must of course be less perfect than ours; and if these proud spirits know their own dismal state, what a humiliation must it be to them thus to see themselves reduced to the condition of beasts! But whether they know it or not, so shameful a degradaBrute. divine vengeance I just mentioned; it is an anticipated to do evil, to disconcert the general order, to commit Brute. ❤ hell.'

Having mentioned the prejudices against this hypothesis, such particularly as the pleasure which people of sense and religion take in beasts and birds, especially all sorts of domestic animals, he proceeds, "Do we love beasts for their own sakes? No. As they are altogether strangers to human society, they can have no other appointment but that of being useful and amusing. And that amuses us? The thought of it, far from shocking, pleases me mightily. I with gratitude admire the goodserve and amuse me. If I am told that these poor devils are doomed to suffer eternal tortures, I admire God's decrees, but I have no manner of share in that dreadful sentence; I leave the execution of it to the sovereign judge; and, notwithstanding this, I live with my little devils as I has perverted their primitive nature. do with a multitude of people, of whom religion informs me that a great number shall be damned. But the cure done by time and reflection: give me leave, then, lightly to touch upon this difficulty, in order to observe a very

important thing to you.

"Persuaded as we are that beasts have intelligence, have we not all of us a thousand times pitied them for the excessive evils which the majority of them are exposed to, and in reality suffer? How unhappy is the condition of horses! we are apt to say upon seeing a horse whom an unmerciful carman is murdering with blows. How mi-How dismal is the fate of beasts living in woods! they are perpetually exposed to the injuries of the weather; always seized with apprehensions of becoming the prey of hunters, or of some wilder animal; for ever obliged, after long fatigue, to look out for some poor insipid food; often suffering cruel hunger; and subject, moreover, to illness and death! If men are subject to a multitude of miseries that overwhelm them, religion acquaints us with the reason of it, viz. the being born sinners. But what crimes can beasts have committed by birth to be subject to evils so very cruel? What are we, then, to think of the horrible excesses of miseries undergone by beasts? miseries, indeed, far greater than those endured by men. This is, in any other system, an incomprehensible mystery; whereas nothing is more easy to be conceived from the system I propose. The rebellious spirits deserve a punishment still more rigorous, and happy it is for them that their punishment is deferred. In a word, God's goodness is vindicated, man himself is justified; for what right can we have, without necessity, and often in the way of mere diversion, to take away the lives of millions of beasts, if God had not authorized us so to do? And beasts being as sensible as ourselves of pain and death, how could a just and merciful God have given man that privilege, if they were not so many guilty victims of the divine vengeance?

"But hear still something more convincing, and of greater consequence. Beasts by nature are extremely vicious. We know well that they never sin, because they are not free; but this is the only condition wanting to make them sinners. The voracious birds and beasts of prey are cruel. Many insects of one and the same species devour one another. Cats are perfidious and ungrateful, monkeys are mischievous, and dogs envious. All beasts in general are jealous and revengeful to excess, not to mention many other vices we observe in them; and at the same time that they are by nature so very vicious, they have, say we, neither the liberty nor any helps to resist the bias that hurries them into so many bad ac-

whatever is most contrary to the notion we have of natural justice and to the principles of virtue. What monsters are these in a world originally created for order and justice to reign in? This is, in good part, what formerly persuaded the Manicheans that there were of necessity two orders of things, one good and the other bad; and that the beasts were not the work of the good principle: a monstrous error! But how then shall we believe that what care we whether it be a devil or any other creature beasts came out of the hands of their Creator with qualitics so very strange! If man is so very wicked and corrupt, it is because he has himself through sin perverted ness of the Creator, who gave me so many little devils to the happy nature that God had given him at his creation. Of two things then we must say one; either that God has taken delight in making beasts so vicious as they are, and of giving us in them models of what is most shameful in the world; or that they have, like man, original sin, which

"The first of these propositions finds very difficult access to the mind, and is an express contradiction to the of a prejudice is not to be effected in a moment; it is holy Scriptures, which say, that whatever came out of God's hands at the time of the creation of the world was good, yea very good. What good can there be in a monkey's being so very mischievous, a dog so full of envy, a cat so malicious? But then many authors have pretended that beasts, before man's fall, were different from what they are now; and that it was in order to punish man that they became so wicked. But this opinion is a mere supposition, of which there is not the least footstep in holy Scripture. It is a pitiful subterfuge to elude a serable is the dog whom they are breaking for hunting! real difficulty. This at most might be said of the beasts, with whom man has a sort of correspondence; but not at all of the birds, fishes, and insects, which have no manner of relation to him. We must then have recourse to the second proposition, that the nature of beasts has, like that of man, been corrupted by some original sin: another hypothesis, void of foundation, and equally inconsistent with reason and religion, in all the systems which have been hitherto espoused concerning the souls of beasts. What party are we to take? Why, admit of my system, and all is explained. The souls of beasts are refractory spirits, which have made themselves guilty towards God. The sin in beasts is no original sin; it is a personal crime, which has corrupted and perverted their nature in its whole substance; hence all the vices and corruption we observe in them, though they can be no longer criminal, because God, by irrevocably reprobating them, has at the same time divested them of their liberty."

> These quotations contain the strength of Father Bougeant's hypothesis, which also has had its followers; but the reply to it is very obvious. Beasts, though remarkably mischievous, are not completely so; they are in many instances capable of gratitude and love, which devils cannot possibly be. The very same passions which are implanted in the brutes exist in the human nature; and if we choose to argue from the existence of those passions, and the ascendency they at some times have over mankind, we may say with as great justice that the souls of men are devils, as that the souls of brutes are devils. All that can reasonably be inferred from the greater prevalency of the malignant passions among the brutes than among men, is, that the former have less rationality than men; and accordingly it is found that among savages, who exercise their reason less than other men, every species of barbarity is practised without being deemed a crime.

On the present subject there is a very ingenious treatise in German, published by Professor Bergman, under the title of "Researches designed to show what the brute animals certainly are not, and also what they probably tions. They are, according to the schools, necessitated are." That they are not machines, he proves with more

detail than seemed necessary for refuting a hypothesis order to draw away the dogs from her helpless covey. In Brute. certain that the half-reasoning elephant cannot be deemed a machine by us, from any other consideration than that he goes upon four feet, while we go upon two; and

go upon two feet, while he goes upon four.

But if animals are not mere machines, what are they? Manifestly sensitive beings, with an immaterial principle; and thinking or reasoning beings to a certain degree. In certain classes of animals this appears evident to our author, who seems to have observed with great sagacity and attention their various operations and proceedings, their ways and means, &c. He thinks it impossible to deduce this variety of action, in any animals, if we except those of the lowest classes in the gradation of intelligence, from a general and uniform instinct. For they accommodate their operations to times and circumstances. They combine; they choose the favourable moment; they avail themselves of the occasion, and seem to receive instruction by experience. Many of their operations announce reflection: the bird repairs a shattered nest, instead of constructing instinctively a new one; the hen who has been robbed of her eggs changes her place in order to lay the remainder with more security; the cat discovers both care and artifice in concealing her kittens. Again, it is evident that on many occasions animals know their faults and mistakes, and correct them; they sometimes contrive the most ingenious methods of obtaining their ends, and when one method fails have recourse to another; and they have, without doubt, a kind of language for the mutual communication of their ideas. How is all this to be accounted for, says our author, unless we suppose them endowed with the powers of perceiving, thinking, remembering, comparing, and judging? They have these powers, indeed, in a degree inferior to that in which they are possessed by the human species, and form classes below them in the graduated scale of intelligent beings. But still it seems to our author unreasonable to exclude them from the place which the principles of sound philosophy, and facts ascertained by constant observation, assign to them in the great and diversified sphere of life, sensation, and intelligence. He does not, however, consider them as beings whose actions are directed to moral ends, nor consequently as accountable and proper subjects for reward or punishment in a future world.

That brute animals possess reflection and sentiment, and are susceptible of the kindly as well as the irascible passions, independently of sexual attachment and natural affection, is evident from the numerous instances of affection and gratitude daily observable in different animals, particularly the dog. Of these and other sentiments, such as pride, and even a sense of glory, the elephant exhibits

proofs equally surprising and indubitable.

As to the natural affection of brutes, says an ingenious writer, " the more I reflect on it the more I am astonished at its effects. Nor is the violence of this affection more wonderful than the shortness of its duration. Thus every hen is in her turn the virago of the yard, in proportion to the helplessness of her brood; and will fly in the face of a dog or a sow, in defence of those chickens which in a few weeks she will drive before her with relentless cruelty. This affection sublimes the passions, quickens the invention, and sharpens the sagacity of the brute creation. Thus a hen, just become a mother, is no longer that placid bird she used to be; but, with feathers standing on end, wings hovering, and clocking note, she runs about like one possessed. Dams will throw themselves in the way of the greatest danger, in order to avert it from their progeny. Thus a partridge will tumble along before a sportsman, in

which would equally tend to make us all machines. It is the time of nidification the most feeble birds will assault the most rapacious. All the hirundines of a village are up in arms at the sight of a hawk, whom they will persecute till he leaves that district. A very exact observer he might as well take us for mere machines, because we has often remarked, that a pair of ravens nestling in the rock of Gibraltar would suffer no vulture or eagle to rest near their station, but would drive them from the hill with amazing fury; even the blue thrush, at the season of breeding, would dart out from the clefts of the rocks to chase away the kestrel or the sparrow-hawk. If you stand near the nest of a bird that has young, she will not be induced to betray them by an inadvertent fondness, but will wait about at a distance with meat in her mouth for an hour together. The fly-catcher builds every year in the vines that grow on the walls of my house. A pair of these little birds had one year inadvertently placed their nest on a naked bough, perhaps in a shady time, not being aware of the inconvenience that followed; but a hot sunny season coming on before the brood was half fledged, the reflection of the wall became insupportable, and must inevitably have destroyed the tender young, had not affection suggested an expedient, and prompted the parent-birds to hover over the nest all the hotter hours, while with wings expanded and mouths gaping for breath they screened off the heat from their suffering offspring. A further instance I once saw of notable sagacity in a willow-wren, which had built in a bank in my fields. This bird a friend and myself had observed as she sat in her nest; but were particularly careful not to disturb her, though we saw she eyed us with some degree of jealousy. Some days after, as we passed that way, we were desirous of remarking how this brood went on; but no nest could be found, till I happened to take up a large bundle of long green moss, as it were carelessly thrown over the nest in order to dodge the eye of any impertinent intruder." (White's Natural History of Selborne.)

A wonderful spirit of sociality in the brute creation, independent of sexual attachment, has been frequently remarked; nor does this propensity seem to be confined to animals of the same species. Even great disparity of kind and size does not always prevent social advances and mutual fellowship. Of this the following remarkable instance is given in the work above quoted: "A very intelligent and observant person has assured me, that in the former part of his life, keeping but one horse, he happened also on a time to have but one solitary hen. These two incongruous animals spent much of their time together in a lonely orchard, where they saw no creature but each other. By degrees an apparent regard began to take place between these two sequestered individuals. The fowl would approach the quadruped with notes of complacency, rubbing herself gently against his legs; while the horse would look down with satisfaction, and move with the greatest caution and circumspection, lest

he should trample on his diminutive companion.

To such an instance of attachment between incongruous animals, may be added the following instance recounted by Mr White, in the work already quoted. "My friend had a little helpless leveret brought to him, which the servants fed with milk in a spoon; and about the same time his cat kittened, and the young were despatched and buried. The hare was soon lost, and supposed to be gone the way of most foundlings, or to be killed by some dog or cat. However, in about a fortnight, as the master was sitting in his garden in the dusk of the evening, he observed his cat, with tail erect, trotting towards him, and calling with little short in ward notes of complacency, such as they use towards their kittens, and something gambling after, which proved to be the leveret, which the cat had supported with her milk, and continued to support with great affection. Thus was a graBrute.

minivorous animal nurtured by a carnivorous and predaceous one.

"This incident is no bad solution of that strange circumstance which grave historians as well as the poets assert, of exposed children being sometimes nurtured by female wild beasts that probably had lost their young; for it is not one whit more marvellous that Romulus and Remus, in their infant state, should be nursed by a she-wolf, than that a poor little suckling leveret should be fostered and cherished by a

bloody grimalkin."

But besides the different qualities enumerated, besides reflection and sagacity often in an astonishing degree, and besides the sentiments and actions prompted by social or natural attachments, certain brutes seem on many occasions inspired with a superior faculty, a kind of presentiment or second sight as it were, with regard to events and designs altogether unforeseen by the rational beings whom they concern. Of the faculty alluded to, various instances will probably consist with the knowledge or the recollection of most readers: we shall therefore only recite the following, on account of its unquestionable authenticity. At the seat of the Earl of Lichfield, three miles from Blenheim, in the diningroom there is a portrait of Sir Henry Lee, by Johnston, with that of a mastiff-dog which saved his life. It seems a servant had formed the design of assassinating his master and robbing the house; but the night he had fixed on, the dog, which had never been much noticed by Sir Henry, for the first time followed him up stairs, got under his bed, and could not be got from thence by either master or man: in the dead of night the same servant entered the room to execute his horrid design, but was instantly seized by the dog, and being secured, confessed his intentions. Upon what hypothesis can we account for a degree of foresight and penetration such as this? Or will it be suggested as a solution of the difficulty that a dog may possibly become capable in some measure of understanding human discourse, and of reasoning and acting accordingly; and that, in the present instance, the villain had either uttered his design in soliloquy, or imparted it to an accomplice, in the hearing of the animal?

It has been much disputed whether the brutes have any language by which they can express their minds to each other; or whether all the noise they make consists only of cries inarticulate, and unintelligible even to themselves. We are, however, too little acquainted with the intellectual faculties of these creatures to be able to determine this point. Certain it is, that their passions, when excited, are generally productive of some peculiar cry; but whether this be designed as an expression of the passion to others, or only a mechanical motion of the muscles of the larvnx occasioned by the passion, is what we have no means of knowing. We may, indeed, from analogy, conclude with great reason that some of the cries of beasts are really expressions of their sentiments; but whether one beast is capable of forming a design, and communicating that design by any kind of language to others, is what we submit to the judgment of the reader, after giving the following instance, which, with others, is brought as a proof of it by Father Bougeant. "A sparrow finding a nest that a martin had just built standing very conveniently for him, possessed himself of it. The martin, seeing the usurper in her house, called for help to expel him. A thousand martins came full speed, and attacked the sparrow; but the latter being covered on every side, and presenting only his large beak at the entrance of the nest, was invulnerable, and made the boldest of them who durst approach him repent of their temerity. After a nuarter of an hour's combat, all the martins disappeared. The sparrow thought he had got the better, and the spectators judged that the martins had abandoned their undertaking. Not in the least. They immediately returned to the charge; and each of them having procured a little of

that tempered earth with which they make their nests, they all at once fell upon the sparrow, and inclosed him in the nest to perish there, though they could not drive him thence. Can it be imagined that the martins could have been able to hatch and concert this design all of them together without speaking to each other, or without some medium of communication equivalent to language?" We refer those curious in this subject, to a work in two volumes, published at Amsterdam, entitled Histoire critique de l'Ame des Bêtes contenant les sentimens des Philosophes Anciens et ceux des Modernes sur cette matière, par M. Guer, Avocat; and to Lord Brougham's Illustrations of Paley, vol. i.

BRUTON, a market-town of England, in the hundred of the same name, county of Somerset. It is pleasantly situated in the valley of the Brue, 10 miles S.S.W. of Frome, and has a town-hall, hexagonal market-cross, grammar-school with four exhibitions at either of the universities, and some manufactures of silk, woollens, and hosiery. Mar-

ket-day Saturday. Pop. of parish (1851) 2109.

BRUTTII; in Ancient Geography, the most southern portion of the Italian peninsula, stretching towards Sicily; bounded by the sea on every side except on the north, where it is bounded by Lucania. It was inhabited by the Bruttii, for whose country the ancient Romans had no peculiar name, calling both the people and the country indiscriminately Bruttii.

BRUTUS, or BRUTE, according to the fabulous exploded history of this country by Geoffroy of Monmouth, was the first king of Britain. He was born in Italy, and is said to have been the son of Sylvius, who was the son of Ascanius the son of Æneas. Having accidentally killed his father, he fled into Greece, where he took prisoner king Padrosus, who kept the Trojans in slavery; but he released him on the condition of his providing ships for the Trojans to quit the land. Being advised by the oracle to sail west beyond Gaul, after some adventures he landed at Totness in Devonshire. Albion was then inhabited by a remnant of giants, whom Brutus destroyed. He called the island after his own name, Britain; and built a city called New Troy, since London. He reigned there twenty-four years, and at his death parcelled the island among his three sons, giving to Locrine the middle, called Loegria; to Camber, Wales; and to Albanach, Scotland.

Brutus, *Lucius Junius*, the avenger of the rape of Lucretia, and founder of the Roman republic, flourished five hundred years before Christ. See ROMAN HISTORY.

BRUTUS, Marcus, the passionate lover of his country, and chief conspirator against Cæsar. He slew himself on losing the battle of Philippi, B.C. 42. See ROMAN HISTORY.

BRÜX, a city in the circle of Saatz, and Austrian kingdom of Bohemia, is situated on the river Bila. It contains a philosophical institution, eight churches, two monasteries, gymnasium, barracks; and has 3500 inhabitants, engaged in the coal-mines, and in the preparation of salts from

the Seidlitz waters in the vicinity.

BRUYÈRE, Jean de la, the author of the celebrated work entitled Caractères de Théophraste, traduits du Grec, avec les mœurs de ce siècle, which first appeared at Paris in 1687, 12mo. He was born near Dourdan in Normandy, in 1639, or, according to some, in 1644. Few particulars of his life have been preserved. After filling the office of treasurer of France at Caen he removed to Paris, and was appointed teacher of history, under Bossuet, to the Duke de Burgogne, grandson to the great Condé. La Bruyère, with a pension of 1000 crowns, passed the remainder of his life in the service of his pupil, in the capacity of homme de lettres. He was admitted a member of the French Academy in 1693; and he died suddenly of apoplexy at Versailles, May 10, 1696.

"The *Characters* of Bruyère," says Voltaire, "may justly be ranked among the extraordinary productions of the age. Antiquity furnishes no examples of such a work. A style

Bruyn || Bryant. rapid, concise, and nervous; expression animated and picturesque; a use of language altogether new, without offending against its established rules, struck the public at first; and the allusions which are crowded in almost every page completed its success. When La Bruyère showed his work in manuscript to Malézieux, he was told that the book would have many readers, and its author many enemies. It somewhat sunk in the opinion of men, when that whole generation whose follies it attacked were passed away; yet as it contains many things applicable to all times and places, it is more than probable that it will never be forgotten."

This admirable work is highly commended by Locke, and has always been a favourite book with readers of taste and discernment. Bruyère left also an unfinished work, published in 1699 under the title of *Dialogues posthumes du Sieur de La Bruyère sur le Quiétisme*, &c., 12mo, but now forgotten.

Of the numerous editions of the *Characters*, the best is that published in 1827, 2 vols. 8vo, with a life of the author

by M. Sicard, notes, &c.

BRUYN, CORNELIUS, a Dutch traveller and clever artist, author of Travels in the East, was born at the Hague in 1652. His Voyage au Levant was published at Paris in 1714; and his Voyages en Muscovie, Perse, et Les Indes Orientes appeared at Amsterdam in 1718. Both are illustrated with upwards of 500 engravings after his own drawings. These works, as well as his Observations on the Engravings published by former travellers on Persepolis, are curious and instructive, and the fidelity of his descriptions are confirmed by later travellers. He died at Utrecht in 1719.

BRYAN, or BRYANT, SIR FRANCIS, an English poet, warrior, and statesman, was born of a respectable family, and educated at Oxford. In 1522 he attended in a military capacity the Earl of Surrey in his expedition to the coast of Brittany, and commanded the troops in the attack of the town of Morlaix, which he took and burnt. For this service he was knighted on the spot by the earl. In 1529 he was sent ambassador to France, and the following year to Rome, on account of the king's divorce. He was gentleman of the privy chamber to Henry VIII., and to Edward VI., in the beginning of whose reign he marched with the protector against the Scots; and after the battle of Musselburgh, in which he commanded the light horse, he was made banneret. In 1549 he was appointed chief governor of Ireland; and there he married the Countess of Ormond. He died in 1550, and was buried at Waterford. He wrote Songs and Sonnets, some of which were printed with those of Surrey and Wyatt, Lond. 1565; and Letters (MSS.) written from Rome concerning the king's divorce.

Bryant, Jacob, a profound scholar, mythologist, and sacred historian, born at Plymouth in 1715. His father had a place in the customs, and was afterwards stationed in Kent, where his son was first sent to a provincial school, from which he was removed to Eton. Here he appears to have remained till 1736, the date of his election to King's College, Cambridge; where he took his degrees of bachelor and master of arts in 1740 and 1744. He returned to Eton in the capacity of private tutor to the Duke of Marlborough, then Marquis of Blandford; and the good taste which his pupil showed through life, in the protection of the fine arts, and in the pursuit of science, sufficiently demonstrated the beneficial influence of his instructor's example. In 1756 he went to the Continent as private secretary to the Duke of Marlborough, then master-general of the ordnance and commander-in-chief of the forces in Germany; and he was rewarded after his return, for his various services to the family, by a lucrative appointment in the ordnance, which allowed him ample leisure to indulge his literary taste in a variety of refined investigations, and to exercise his zeal for the cause of religion in a multitude of works, calculated for the illustration of the Scriptures, and the demonstration of their authenticity and divine authority.

His first publication was entitled Observations and Inquiries relating to various parts of Ancient History, containing Dissertations on the wind Euroclydon, and on the island Melite, together with an account of Egypt in its most early state, and of the Shepherd Kings, 1767. In this work he attempts to prove that the Melite on which St Paul was wrecked was not Malta, but one of the Illyrian islands in the Adriatic, now called Melede; and he endeavours to illustrate several points in the early history of the

oriental, and especially of the Aramitic nations. But his most elaborate performance was his New System or Analysis of Ancient Mythology, wherein an attempt is made to divest tradition of fable, and to reduce truth to its original purity, 3 vols. 4to, 1774-76. In this attempt the author has equally displayed his deep and extensive learning and his inventive fancy; but it must be confessed that, on a minute examination, the work exhibits much more of a poetical imagination than of a sound judgment; and that, in endeavouring to substitute etymological for historical evidence, he has been completely unsuccessful. Nothing can afford a more satisfactory kind of proof than etymology taken on a large scale, and considered as a mode of tracing the relations of nations to each other, by the affinities of their languages; since the accumulation of a multitude of probabilities, each weak when taken separately, becomes at last equivalent to absolute certainty. But nothing, on the other hand, can be more fallacious, or more liable to controversy, than single etymological inferences, in particular cases, when one of these slight resemblances is magnified into a striking likeness, and even an identity, which is then made the foundation of a magnificent superstructure in mythology or in history. Mr Richardson has shown, in the preface to his Dictionary, how much Mr Bryant was mistaken in some of his reasoning respecting the signification and derivation of particular words; and even if he had been more correct in these instances, the conclusions which he has deduced from his etymologies would by no means have been perfectly legitimate. Jablonsky seems to have exhibited one of the strongest examples of this dangerous abuse of learning; in which he has been followed not only by Bryant, but by several other modern writers equally visionary, who have commonly been very imperfectly acquainted with the languages on which their conjectures depended, and have been still more deficient in that sort of common sense and correct feeling, confirmed by experience, which constitutes the most essential part of the qualifications of a critic, and the want of which can never be compensated by the most unwearied labour of a mere mechanical commentator.

Some remarks which had been made on particular passages of Mr Bryant's work led him to publish A Vindication of the Apamean Medal; of the inscription NΩE; and of another coin, in the Archæologia, vol. iv. art. 21, 22, 23. He deviated somewhat more widely from the usual objects of his research, and apparently without any decided advantage over his adversary, in An Address to Dr Priestley, on the doctrine of philosophical necessity, 8vo, 1780. He also published in the same year Vindiciæ Flavianæ, or a vindication of the testimony given by Josephus concerning our Saviour, 8vo.

Unfortunately for the credit of his critical discrimination in matters of old English literature, Mr Bryant was the author of Observations on the Poems of Thomas Rowley, in which the authenticity of these poems is ascertained, 2 vols. 12mo, 1781. If there could be any excuse for the commission of forgeries like that of Chatterton, it would be found in their serving as a valuable test of the degree of confidence which it is justifiable to place in the decrees of the most powerful critics respecting other questions of a more ambiguous nature.

Mr Bryant contributed to the publication of the Duke of Marlborough's Collection of Gems, the Latin explans-

Bryaxis. tions contained in the first volume, fol. 1783. He inserted in the Archæologia, vii. 387, some Collections on the Zingara or Gipsey Language, which has since been sufficiently proved to be one of the many derivatives of the old Sanscrit. Some time afterwards he published an anonymous Treatise on the Authenticity of the Scriptures, and the truth of the Christian Religion, 1792. This was succeeded by his Observations upon the Plagues inflicted upon the Egyptians, 8vo, 1794.

His opinions respecting the existence of the city of Troy, and the veracity of Homer as a historian, raised up against him a host of powerful adversaries; and in a question of this nature, upon which the decisions of mankind are so manifestly influenced by their sensibility to poetical beauty, and their early habits and attachments, a much more cautious attempt to innovate might easily have been unsuccessful. Whatever learning and talents may have been exhibited in this controversy, it will hardly be believed by an impartial judge, reasoning on the general probabili-ties of the case, that Homer intended the actions of his heroes, any more than their genealogies, to be historically correct; but, at the same time, it will readily be admitted that he was much more likely to take for the scene of his poem a town that had really existed, and for its subject, a traditional report of a war which had actually been carried on, than to have invented a fabulous city and an imaginary warfare, without any historical foundation whatever. Mr Bryant published on this subject Observations on a Treatise entitled Description of the Plain of Troy, by Mr de Chevalier, 4to, 1795: A Dissertation concerning the War of Troy, and the expedition of the Greeks, as described by Homer; showing that no such expedition was ever undertaken, and that no such city in Phrygia existed; 4to, 1796: Observations on the Vindication of Homer, written by J.B.S. Morritt, Esq., 4to, 1799.

He had, in the meantime, not discontinued his theological studies, and had published an Essay on The Sentiments of Philo Judæus concerning the Word of God, 8vo, 1797. His last work was a volume of Dissertations on various Subjects in the Old Testament, which had been nearly completed thirty years before. The subjects which had particularly attracted his attention were the histories of Balaam, Samson, and Jonah; and besides Philo Judæus and Josephus, he had endeavoured to illustrate some controverted passages of Justin Martyr, as well as many other departments of religious and historical discussion.

The habits of Mr Bryant's maturer life were in general completely sedentary; although, in his youth, he had taken his full share in the cultivation of the manly exercises common to Etonians, and had once the good fortune to save, by his proficiency in swimming, the life of Dr Barnard, afterwards provost of Eton. His conversation was elegant and animated, his manners mild but firm; he exerted himself to please others, and was himself easily pleased. He was much courted in society, and his residence at Cypenham, near Windsor, was not unfrequently visited by persons of the highest possible rank. He never married. He died in his eighty-ninth year, the 14th November 1804, from the immediate consequence of an accidental blow. He left his library to King's College, having, however, previously made some valuable presents out of it to the king and to the Duke of Marlborough. He also bequeathed L.2000 to the Society for the Propagation of the Gospel, and L.1000 for the use of the superannuated collegers of Eton school. man's Magazine, lxxiv. p. 1080, 1165; Nichols's Literary Anecdotes, iv. 667, 8vo, Lond. 1812; Aikin's Biographical Dictionary, x.) (T.Y.)

BRYAXIS, a celebrated Athenian statuary. His era is uncertain; but as he executed a statue of Seleucus king of Syria, and contributed, along with Timotheus and other artists, to adorn the Mausoleum, it may be placed in the

latter half of the fourth century B.C. His skill may be in-Bryennius ferred from the fact, that several of his statues were at differ-Bubastis. ent times attributed to Phidias.

BRYENNIUS, MANUEL, a Greek writer on music, who is supposed to have flourished under the emperor Andronicus I., who reigned from 1282 till 1328. He wrote three books of harmonics, the first of which is a kind of commentary on Euclid, while the second and third are illustrative of the theory of Ptolemy. Meibomius had given the public expectations of a translation of this work, but not living to complete his task, Dr Wallis published it in 1680; and it now forms part of the third volume of his works, published at Oxford in 3 vols. fol., 1699. In the Royal Library at Paris there are several fine MSS. of Bryennius's work; which, however, throws no light on the mysterious subject of the structure of ancient Greek melody.

BRYONIA Dioica, bryony—a native plant which was formerly used as a drastic purgative, but is now disused be-cause of its violent effects. The root yields bryonine, an acrid vegetable alkaloid which is very poisonous.

BRYOPHYLLUM, a genus of succulent plants, which have the property of budding from the margin of their leaves. The only known species is B. calycinum, a native of the Moluccas.

BRZESC, a fortified town of Russia, on the right bank of the Bug, in the government of Grodno, 110 miles south of the city of that name. It has a citadel, an old castle, a famous Jewish synagogue, high school, and an active transit trade. In 1794 this was the scene of a battle between the Russians and Poles. Pop. 8000.

BRZEZANY, the capital of a circle of the same name in Austrian Galicia, situated on the Zlotar Lissa, 50 miles S. by E. of Lemberg. It has a castle, gymnasium, and some manufactures of linen. Pop. 7500.

BUA, an island in the Adriatic Sea, belonging to the province of Spalatro, in the Austrian kingdom of Dalmatia. It is situated on the coast, opposite to Trau, with which it is connected by a bridge; is rich in wine, oil, and fruit; and contains about 4000 inhabitants. There is in it a remarkable well of asphaltum.

BUAT-NANCAY, LOUIS-GABRIEL, COUNT DU, a diplomatist and historian, was born of an old family in Normandy, March 2, 1732. At an early age he entered into the order of Malta; and became acquainted with the Chevalier de Folard, author of the Commentaries on Polybius, who received him into his house and superintended his education. Buat, through Folard's influence, was successively minister for France at Ratisbon and Dresden; but becoming disgusted with this career, he retired from public life in 1776. He died at Nançay, in Berry, Sept. 18, 1787.

Buat was a man of some talents and considerable literary attainments, but his want of knowledge of the world seems to have in a great measure disqualified him for public employment. He wrote with great facility; but his style is very unequal. He was the author of several works on politics and history, of which the best are his Tableau du Gouvernement actuel de l'Empire d'Allemagne, translated from the German of Schmauss, with notes historical and critical, Paris, 1755, 12mo. Les Origines, ou l'Ancien Gouvernement de la France, de l'Italie, et de l'Allemagne, Hague, 1757, 4 vols. 12mo. Histoire Ancienne des Peuples de l'Europe, Paris, 1772, 12 vols. 12mo. Besides other works, he contributed various articles to the journals of his time, on history, literature, and political economy; in particular, some excellent observations on the character of Xenophon, inserted in vol. iv. of the Variétés Litteraires. (See Biographie Universelle.)

BUBASTIS, in the Egyptian mythology, one of the mes of Isis or the moon. The Egyptians bestowed difnames of Isis or the moon. ferent names on the sun, either to characterize its effects or its relations with respect to the earth; and they followed Bubons

writer of Egypt, leaves no doubt on this subject. "Every count. Bucaneer, thing which is published of Osiris and Isis, all the sacerdotal is for this reason that the Greeks, who honoured the moon and tallow they should procure by hunting. by the name of Artemis (Diana), bestowed it also on this power to Artemis (Diana). Among the numerous Egyptian antiquities in the British Museum there are several to be Paset.

BUBONA, among the Romans, the name of the god- free prey or booty of whatever came in their way. dess who presided over cows and oxen. Small statues of

BUBULCUS, the name of a family of the Junian gens. The only member of this family who particularly distinguished himself was C. Junius Bubulcus Brutus, who held all the highest offices of state in the republican times of anthe loss of 20,000 men near Bovianum. For this victory he was honoured with a triumph.

BUC, SIR GEORGE, a learned English antiquary, dethe Third Universitie of England. He died in 1623.

BUCANEER (from the French boucaner), in its pri-

the same method respecting the moon. Chæremon, a sacred niards of America. Of both these we shall give an ac-Bucaneer.

I. The Bucaneers of St Domingo.—The Spaniards had fables, allude only to the phases of the moon and the course not long been in possession of the West Indies and of of the sun." Bubastis was one of the principal attributes of the continent of America, when other nations, especially Isis. Theology first personified her, and then raised her to the English and French, began to seek establishments the rank of divinity, in whose honour a city of that name there. But though the Spaniards were unable to people was built, as described by Herodotus (ii. 137, 138), and such extensive countries themselves, they were resolved where the people, to the number of 700,000, collected an- that no others should do it for them, and therefore waged nually from all parts of Egypt to celebrate her festival a cruel war on all those of any other nation who attempted The symbol of this deity was a cat, which the priests fed to settle in any of the Antilles or Caribbee Islands. The with sacred food; and when it died, its body was embalmed French, however, were at last lucky enough to acquire and carried in pomp to the tomb prepared for its reception. some footing in the island of St Christophers; but by the The ancients have explained this worship variously. The time they began to subside into a regular form of govern-Greeks maintained that when Typhon declared war against ment, the Spaniards found means to dislodge them. Upon the gods, Apollo transformed himself into a vulture, Mer- this the wretched fugitives, considering at how great a cury into an ibis, and Bubastis into a cat, and that the ve- distance they were from their mother country, and how neration of the people for the latter animal took its rise near to the island of Hispaniola or St Domingo, the northfrom that fable; but they ascribed their own ideas to the ern parts of which were then uninhabited, and full of Egyptians, who thought very differently. However that swine and black cattle, immediately resolved to take posmay be, the cat was greatly honoured in Egypt; and on one session of that country, in conjunction with several other occasion when a Roman soldier imprudently killed one, he adventurers of their own and the English nation; espewas immediately put to death by the populace. In the lan- cially as the Dutch, who now began to appear in these guage of the priests, Bubastis was deemed the daughter of seas, promised to supply them plentifully with all kinds of Isis, and even represented her in certain circumstances. It necessaries they might require, in exchange for the hides

These new settlers obtained the name of bucaneers, from Egyptian divinity. The Egyptians attributed to Bubastis their custom of bucanning their beef and pork in order to the virtue of assisting pregnant women; while the Greeks keep it for sale or for their own consumption. But some of and Latins, disciples of the Egyptians, ascribed the same them soon grew tired of this new way of life, and took to planting; whilst many more chose to turn pirates, trusting to find among those who remained on shore a quick sale statues of Bubastis, whose hieroglyphic name is now known for all the plunder they could make at sea. This new body of adventurers were called freebooters, from their making

The colony now began to thrive at a great rate, by the this divinity were generally placed in the niches of byres cheap and easy manner in which the freebooters acquired and stables; or a likeness of the goddess was painted over the greatest riches, and the profusion with which they distributed them amongst their old companions, the bucaneers and planters, for the merest trifles. This brought numbers of settlers from France in quality of indentured servants, though they toiled rather like slaves than servants during the three years for which they generally bound cient Rome, was three times consul, and in B. C. 302 was themselves. One of these men presuming to represent to appointed dictator. He rendered important service to the his master, who always fixed upon a Sunday for sending state in its war with the Samnites, whom he defeated with him with skins to the port, that God had forbidden such a practice when he had declared that "six days shalt thou abour, and on the seventh day shalt thou rest," the brutish bucaneer replied, " And I say to thee, six days shalt scended of an ancient family in Lincolnshire, and born to- thou kill bulls, and strip them of their skins, and on the wards the close of the 16th century. In the reign of James seventh day shalt thou carry their hides to the sea shores;" I he was made one of the gentlemen of his Majesty's privy and this command was followed by blows. Thus the chamber, and knighted; and was also constituted master of colony consisted of four classes; bucaneers, freebooters, the revels. His greatest claim to distinction is his History planters, and indentured servants who generally remain-of the Reign of Richard III.; in which (as if in anticipa- ed with the bucaneers or planters. And these four orders tion of Horace Walpole) he endeavours to wipe off the composed what they now began to call the body of advenbloody stains which have tarnished the character of that turers, who lived together in perfect harmony, under a kind prince, and represents his person and actions in a much less of democracy; every freeman having a despotic authority odious light than any other historian has done. He also over his own family, and every captain being sovereign in wrote a Treatise of the Art of Revels; and a work entitled his ship, though liable to be discarded at the discretion of the crew.

The planters had settled chiefly in the little island of mary sense, denotes one who dries and smokes flesh or fish Tortuga, on the northern coast of Hispaniola; but soon after the manner of the Indians. The name was particularly afterwards some of them having gone to the great island given to the first French settlers in the island of St Do- to hunt with the bucaneers, the rest were surprised by the mingo or Hayti, whose principal employment consisted in Spaniards; and all, even those who had surrendered at hunting bulls or wild boars, in order to sell their hides discretion in hopes of mercy, were put to the sword or and flesh. The name has also been applied to those hanged. The next care of the Spaniards was to rid the famous piratical adventurers, chiefly English and French, great island of the bucaneers; and for this purpose they who joined together to commit depredations on the Spa- assembled a body of five hundred lance-men, who, by Bucaneer, their seldom going fewer than fifty in a company, obtained any brim, except a little flap in the front; and shoes of Bucaneer, from their enemies the name of the Fifties. But before hogskin, all of a piece. Their guns were four feet and a

people whom it was proposed to extirpate.

The bucaneers lived in little huts built on some spots of cleared ground, just large enough to dry their skins on, and contain their bucanning houses. These spots they called boucans, and the huts they dwelt in ajoupas, a word which they borrowed from the Spaniards, and the Spaniards from the natives. Though these ajoupas lay open on all sides, they were very agreeable to the hardy inhabitants in a climate where a free circulation of air is so desirable. As the bucaneers had neither wives nor children, they associated by pairs, and mutually rendered each other all the services a master could reasonably expect from a servant, living together in so perfect a community, that the survivor always succeeded his deceased partner. This kind of union or fellowship they called s'emateloter (insailoring), and each other matelot (sailor), whence is derived the custom of giving, at least in some parts of the French Antilles, the name matelotage (sailorage) to any kind of society formed by private persons for their mutual advantage. They behaved to each other with the greatest justice and openness of heart; it was considered as a crime to keep any thing under lock and key; but, on the other hand, the least pilfering was unpardonable, and punished with expulsion from the community. And, indeed, there could be no great temptation to steal, seeing it was reckoned a point of honour never to refuse a neighbour what he wanted; and where there was so little property, it was impossible there should be many disputes. If any such happened, the common friends of the parties at variance interposed, and soon put an end to the difference.

As to laws, the bucaneers acknowledged none but an odd jumble of conventions made between themselves, which, however, they regarded as the sovereign rule. They silenced all objections by coolly answering, that it was not the custom of the coast; and grounded their right of acting in this manner on their baptism under the tropic, which freed them, in their opinion, from all obligations antecedent to that marine ceremony. The governor of Tortuga, when that island was again settled, though appointed by the French court, had very little authority over them; and they contented themselves with rendering him from time to time some slight homage. They had in a manner entirely shaken off the yoke of religion, and thought they did a great deal in not wholly forgetting the God of their fathers. We are surprised to meet with nations among whom it is a difficult matter to discover any trace of a religious worship; and yet it is certain, that had the bucaneers of St Domingo been perpetuated on the same footing on which they subsisted at the time we are speaking of, the third or fourth generation of them would have possessed as little religion as the Caffres and Hottentots of Africa, or the Cannibals of the South Sea Islands.

They even laid aside their surnames, and assumed nicknames or martial names, most of which afterwards continued in their families. Many, however, on their marrying, which seldom happened till they turned planters, took care to have their real surnames inserted in the French contract; and this practice gave occasion to a proverb, which long remained current in the French Antilles, that a man is not to be known till he takes a wife.

Their dress consisted of a filthy greasy shirt, dyed with the blood of the animals they killed; a pair of trousers still more nasty; a thong of leather by way of belt, to which they hung a case containing some Dutch knives, and a kind of short sabre called manchette; a hat without

detailing the particulars of this attack we shall endeavour half in the barrel, and of a calibre sufficient to admit balls to give some account of the manners and customs of the of an ounce. Every man had his contract servants, more or fewer according to his abilities; besides a pack of twenty or thirty dogs, among which there was always a couple of beagles. Their chief employment at first was ox-hunting; and if at any time they chased a wild hog, it was rather for pastime, or to make provision for a feast, than for any other advantage. But in process of time some of them betook themselves entirely to the hunting of hogs, whose flesh they bucanned in the following manner: first, they cut the flesh into long pieces, an inch and a half thick, and sprinkled them with salt, which they rubbed off after twenty-four hours; then they dried these pieces in stoves, over a fire made of the skin and bones of the beast. till they grew as hard as a board, and assumed a deep brown colour. Pork prepared in this manner might be kept in casks a twelvemonth and longer; and when steeped a little while in lukewarm water, it became plump and rosy, yielding, either broiled, boiled, or otherwise dressed, a grateful smell, sufficient to tempt the most languid appetite and please the most delicate palate.

In hunting, they set out at day-break, preceded by the beagles, and followed by their servants with the rest of the dogs; and as they made it a point never to baulk their beagles, they were often led by them over the most frightful precipices, and through places which any other mortal would have deemed absolutely impassable. As soon as the beagles had roused the game, the rest of the dogs struck up and surrounded the beast, stopping it, and keeping a constant barking till the bucaneer could get near enough to shoot it, in doing which he commonly aimed at the pit of the breast; and when the beast fell he hamstrung it, to prevent its rising again. But it has sometimes happened that the creature, not wounded enough to tumble to the ground, has run furiously at his pursuer, and ripped him open. In general, however, the bucaneer seldom missed his aim; and when he did, he was nimble enough to get up the tree behind which he usually had the precaution to place himself; whilst some of them have been seen to overtake the beast in chase, and hamstring it with-

out any further ceremony.

As soon as the prey was half skinned, the master cut out a large bone, and sucked the marrow for breakfast; leaving the rest to his servants, one of whom always remained behind to finish the skinning, and bring the skin, with a choice piece of meat for the huntsman's dinner. They then continued the chase till they had killed as many beasts as there were heads in the company. The master was the last to return to the boucan, loaded like the rest with a skin and a piece of meat. Here the bucaneers found their tables ready; for every one had his separate table, which was the first thing, any way fit for the purpose, that came in their way, a stone, the trunk of a tree, and the like. No table-cloth, no napkin, no bread or wine, graced their board; not even potatoes, or bananas, unless they found them ready to their hand. When this did not happen, the fat and lean of the game, taken alternately, served to supply the place. A little pimento, and the juice of an orange, formed their only sauce; contentment, peace of mind, a good appetite, and abundance of mirth, made. every thing agreeable. Thus they lived and spent their. time, till they had completed the number of hides for which they had agreed with the merchants; which done. they carried them to Tortuga, or some port of the great island.

As the bucaneers used much exercise, and fed only on: flesh, they generally enjoyed a good state of health. They were indeed subject to fevers; but these were either such

Bucaneer, as lasted only a day, and left no sensible impression the day gular a life, entered among the freebooters, who there- Bucaneer. of following, or slight slow fevers, which did not hinder them by became a very powerful body. France, which had was usual with the patient, when asked how he did, to answer, "Very well; nothing ails me but the fever." It was impossible, however, that they should not suffer considerably by such fatigues, under a climate to the heat of which few of them had been early enough inured. Hence the most considerate among them, after they had got money enough for that purpose, turned planters;—the rest soon spent the fruits of their labour in taverns and tippling-houses; and many had so habituated themselves to this kind of life, as to become incapable of any other. Nay, there have been instances of young men, who having early embarked through necessity in this painful and dangerous profession, persisted in it afterwards, merely through a principle of libertinism, rather than return to France and take possession of the most plentiful fortunes.

Such were the bucaneers of St Domingo, and such was their situation when the Spaniards undertook to extirpate them. And at first the assailants met with great success; for as the bucaneers hunted separately, every one attended by his servants, they were easily surprised. Hence the Spaniards killed numbers, and took many more, whom they condemned to a most cruel slavery. But whenever the bucaneers had time to put themselves into a state of defence, they fought like lions, to avoid falling into the hands of a nation from whom they were sure to receive no quarter; and by this means they often escaped; nay, there are many instances of single men fighting their way through numbers. These dangers, however, and the success of the Spaniards in discovering their boucans, where they used to surprise and cut the throats of the bucaneers and their servants in their sleep, engaged them to cohabit in greater numbers, and even to act offensively, in hopes that by so doing they might at last induce the Spaniards to let them live in peace. But the fury with which they behaved whenever they met any Spaniards served only to make their enemies more intent on their destruction; and assistance coming to both parties, the whole island was turned into a slaughter-house, and so much blood spilt on both sides, that many places, on account of the carnage of which they had been the scenes, were described as the hill of the massacre, the plain of the massacre, the valley of the massacre, and so forth.

At length the Spaniards grew tired of this mode of proceeding, and had recourse to their old method of surprise, which, against enemies of more courage than vigilance, was likely to succeed better. This placed the bucaneers under a necessity of never hunting except in large parties, and fixing their boucans in the little islands on the coast, where they retired every evening; an expedient which succeeded very well, and the boucans, by being more fixed, soon acquired the air and consistency of little towns. When the bucaneers had once established themselves, as here related, each boucan sent out scouts every morning to the highest part of the island, in order to reconnoitre the coast, and see if any Spanish parties were abroad. If no enemy appeared, they appointed a place and hour of rendezvous in the evening, and were never absent if not killed or made prisoners. When, therefore, any one of the company was missing, it was not lawful for the rest to hunt again till they had got intelligence of him if taken, or avenged his death if killed. Things continued in this situation for a long time, till the Spaniards made a general hunt over the whole island, and, by destroying the game, forced the bucaneers to betake themselves to another course of life. Some of them turned planters, and thus increased the French settlements on the coast, or formed others; whilst the rest, not relishing so confined and re-

from action, and were of course so little regarded, that it hitherto disclaimed for her subjects these ruffians, whose successes were only temporary, acknowledged them, however, as soon as they formed themselves into settlements, and took proper measures for their government and de-

II. Bucaneers, the Pirates.—Before the English had effected any settlement in Jamaica, and the French in St Domingo, some pirates of both nations, who were afterwards so much distinguished by the name of Bucaneers, had driven the Spaniards out of the small island of Tortuga; and, fortifying themselves there, had with an amazing intrepidity made excursions against the common enemy. They formed themselves into small companies consisting of fifty, a hundred, or a hundred and fifty men each. A boat, of greater or smaller size, was their only armament. Here they were exposed night and day to all the inclemencies of the weather, having scarce room enough to lie down. A love of absolute independence rendered them averse from those mutual restraints which the members of society impose upon themselves for the common good; and as the authority they had conferred on their captain was confined to his giving orders in battle, they lived in the greatest confusion. Like the savages, having no apprehension of want, nor any care to preserve the necessaries of life, they were constantly exposed to the severest extremities of hunger and thirst; but deriving from their very distresses a courage superior to every danger, the sight of a ship transported them to a degree bordering on frenzy. They never deliberated on the attack, but it was their custom to board the ship as soon as possible. The smallness of their vessels, and the skill they showed in the management of them, screened them from the fire of the larger class of ships; and they presented only the fore part of their little vessels filled with fusileers, who fired at the port-holes with so much exactness that it entirely confounded the most experienced gunners. As soon as they threw out the grappling, the largest vessels seldom escaped them.

In cases of extreme necessity they attacked the people of every nation, but fell upon the Spaniards at all times. They thought that the cruelties which the latter had exercised on the inhabitants of the new world justified the implacable aversion they had sworn against them. But this was heightened by the mortification they felt in seeing themselves debarred from the privileges of hunting and fishing, which they considered as natural rights. Their principles of justice and religion in no degree interfered with their predatory habits; for whenever they embarked on any expedition, they used to pray to heaven for the success of it; and they never came back from plundering, without returning thanks to God for their victory.

The ships which sailed from Europe to America seldom tempted their avidity, since the merchandise which these contained could not have been easily sold, nor indeed very profitable to those barbarians. They always waited for them on their return, when they were certain they were laden with gold, silver, jewels, and all the valuable productions of the new world. If they met with a single ship they never failed to attack her. As to the fleets, they followed them till they sailed out of the Gulf of Bahama; and as soon as any one of the vessels was separated by accident from the rest, it was taken. The Spaniards, who trembled at the approach of the bucaneers, whom they called devils, immediately surrendered. Quarter was granted if the cargo proved to be a rich one; if not, all the prisoners were thrown into the sea.

The bucaneers, when they had got a considerable booty, at first held their rendezvous at the island of Tortuga, in

to St Domingo, and the English to Jamaica. Each person, holding up his hand, solemnly protested that he had secreted nothing of what he had taken. If any one among them was convicted of perjury, a case which seldom happened, he was left, as soon as an opportunity offered, upon some desert island, as a traitor unworthy to live in society. Such of their number as had been maimed in any of their expeditions were first provided for. If they had lost a hand, an arm, a leg, or a foot, they received twenty-six pounds; whilst an eye, a finger, or a toe, lost in fight, was valued only at half this sum. The wounded were allowed half a crown per day for two months, to enable them to have their wounds taken care of; and if they had not money enough to answer these several demands, the whole company were obliged to engage in some fresh expedition, and to continue it till they had acquired a sufficient stock to enable them to satisfy these honourable contracts. The remainder of the booty was then divided into as many shares as there were bucaneers. The commander could only lay claim to a single share; but they complimented him with two or three, in proportion as he had acquitted himself to their satisfaction. Favour never had any influence in the division of the booty, for every share was determined by lot. The most rigid justice was extended even to the dead. His share was given to the man who was known to be his companion when alive, and therefore accounted his heir. If the person who had been killed had no intimate, his portion was sent to his relations when they were known; and if there were no friends or relations, it was distributed in charity to the poor, and to the churches, which consented to offer up prayers for the person in whose name these benefactions were given.

When these duties had been complied with, they then indulged themselves in all kinds of profusion. Unbounded licentiousness in gaming, wine, women, and every kind of debauchery, was carried to the utmost pitch of excess, and was stopt only by the want which such profusion brought on. Those who had been enriched with several millions were in an instant totally ruined, and rendered destitute of clothes and provisions. They returned to sea; and the new supplies which they acquired were soon lavished in the same manner as before.

The Spanish colonies, flattering themselves with the hope of seeing an end to their miseries, and reduced almost to despair at finding themselves a perpetual prey to these ruffians, grew weary of navigation. They gave up all the power, conveniencies, and fortune, which their connections procured them, and formed themselves into so many distinct and separate associations. They were sensible of the great inconvenience arising from such a conduct, and avowed it; but the dread of falling into the hands of rapacious and savage men had greater influence over them than the dictates of honour, interest, and policy. This gave rise to that spirit of inactivity which continues to the present time, notwithstanding the agitating events of which that quarter of the world has since been

The despondency thus produced served only to increase the boldness of the bucaneers. As yet they had only appeared in the Spanish settlements in order to carry off provisions when in want of them. But they no sooner found their captures begin to diminish, than they determined to recover by land what they had lost at sea. The richest and most populous countries of the continent were plundered and laid waste. The culture of lands was as much neglected as navigation; and the Spaniards dared no more appear in their public roads, than sail in the latitudes which belonged to them.

Bucaneer. order to divide the spoil; but afterwards the French went new species of freebooting, Montbar, a gentleman of Lan-Bucaneer. guedoc, particularly distinguished himself. Having by chance, in his infancy, met with a circumstantial account of the cruelties practised in the conquest of the New World. he conceived an aversion, which he carried to a degree of frenzy, against that nation which had committed such enormities. The enthusiasm which this spirit of humanity worked him up to merged in a ferocity still more cruel than that of the religious fanaticism to which so many victims had been sacrificed. The manes of these unhappy sufferers seemed to rouse him, and call for vengeance. He had heard some account of the bucaneers, who were said to be the most inveterate enemies to the Spanish name; and he therefore embarked, with some others, on board a ship in order to join them.

> In the passage they met with a Spanish vessel, attacked, and, as was usual in those times, immediately boarded it. Montbar, with a sabre in his hand, fell upon the enemy, broke through them, and, hurrying twice from one end of the ship to the other, levelled every thing that opposed him. When he had compelled the enemy to surrender, leaving to his companions the happiness of dividing so rich a booty, he contented himself with the savage pleasure of contemplating the dead bodies of the Spaniards, against whom he had sworn a constant and deadly hatred.

> Fresh opportunities soon occurred which enabled him to exercise this spirit of revenge without extinguishing it. The ship which conveyed him arrived on the coast of St Domingo, where the bucaneers on land immediately applied to barter provisions for brandy. As the articles they offered were of little value, they alleged in excuse that their enemies had overrun the country, laid waste their settlements, and carried off all their property. "Why," replied Mont-bar, "do you tamely suffer such insults?" "Neither do we," answered they; "the Spaniards have experienced what kind of men we are, and have therefore taken advantage of the time when we were engaged in hunting; but we are going to join some of our companions who have been still worse treated than we, and then we shall have warm work." "If you approve of it," answered Montbar, "I will head you, not as your commander, but as the foremost to expose myself to danger." The bucaneers perceiving from his appearance that he was the very man they wanted, cheerfully accepted his offer; and the same day they overtook the enemy, when Montbar attacked them with an impetuosity that astonished the bravest, and scarce one Spaniard escaped the effects of his fury. The remaining part of his life was equally distinguished as this day. The Spaniards suffered so much from him, both by sea and land, that he acquired the name of the Exterminator.

His savage disposition, as well as that of the other bucaneers who attended him, having obliged the Spaniards to confine themselves within their settlements, the freebooters resolved to attack them there. This new method of carrying on the war required superior forces; and their associations in consequence became more numerous. The first considerable one was that formed by L'Olonois, who derived his name from the sands of Olones, the place of his birth. From the abject state of a bondsman, he had gradually raised himself to the command of two canoes, with twenty-two men; and with these he was so successful as to take a Spanish frigate on the coast of Cuba. He then repaired to Port-au-Prince, in which were four ships. fitted out purposely to sail in pursuit of him; but he took them, and threw all the crews into the sea except one man, whom he saved in order to send him with a letter to the governor of the Havannah, acquainting him with what he had done, and assuring him that he would treat in the same manner all the Spaniards who should fall into his Among the bucaneers who signalized themselves in this hands, not excepting the governor himself if he were for I his canoes and prize ships aground, and sailed with his the object of their wishes. frigate only to the island of Tortuga.

of Porto Bello, a Spanish ship, estimated at L.218,500, and by other actions equally brave and daring. These two gave out that they were going to embark together on an expedition equally glorious and profitable; and in consequence they soon collected together four hundred and forty men. This body of men, the most numerous which the bucaneers had yet been able to muster, sailed to the the entrance for its defence was taken; the cannon were spiked; and the whole garrison, consisting of two hundred and fifty men, were put to death. They then re-embarked and came to Maracaybo, built on the western coast of the lake of the same name, at the distance of ten leagues from its mouth. This city, which had become flourishing and rich by its trade in skins, tobacco, and cocoa, was desertother side of the bay. If the bucaneers had not lost a fortnight in riot and debauchery, they would have found at Gibraltar, near the extremity of the lake, every thing which the inhabitants had secreted, to secure it from being plundered. On the contrary they met with fortifications making themselves masters of at the expense of a great asperated at this disappointment, they set fire to Gibraltar; and Maracaybo would have shared the same fate had it not been ransomed. Besides the sum which they received for its ransom, they also carried off all the crosses, pictures, and bells of the churches; intending, as they said, to build a chapel in the island of Tortuga, and to consecrate this part of their spoils to sacred purposes. make no other offering to heaven than that which arose from their robberies and plunder.

they had made on the coast of Venezuela, Morgan, the most renowned of the English bucaneers, sailed from Jaopposition. The conquest of Panama was an object of much greater importance. To secure this Morgan thought it necessary to sail in the latitudes of Costa-Rica, in order to procure some guides in the island of St Catharines, where the Spaniards confined their malefactors. This place was so strongly fortified that it might to have held out for ten years against a considerable army. But notwithstanding this, the governor, on the first appearance of the pirates, sent privately to concert measures how he might surrender himself without incurring the imputation of cowardice; and the result of this consultation was, that Morgan in the night-time was to attack a fort at some distance, while the governor was to sally out of the citadel to defend a post of so much consequence, and that the assailants should then attack him in the rear, and take him prisoner, which would occasion an immediate surrender of the place. It was agreed that a smart firing should be kept up on both sides, without doing mischief to either. This farce was admirably carried on. The Spaniards, without being exposed to any danger, appeared to have done their duty; and the bucaneers, after having totally demolished the fortifications, and put on board their vessels a prodigious quantity of warlike ammunition, which they found at St Catharines, steered their course towards the river Chagre, the only

Bucaneer. tunate enough to take him. After this expedition he ran channel whereby they could arrive at the place which was Bucaneer.

At the entrance of this considerable river a fort had At Tortuga he met with Michael de Basco, who had been built upon a steep rock, which the waves of the sea distinguished himself by taking, even under the cannon constantly beat against. This bulwark, naturally difficult of access, was defended by an officer whose extraordinary abilities were equal to his courage, and by a garrison which was in all respects worthy of such a commander. Here the bucaneers, for the first time, met with a resistance which could only be equalled by their perseverance; and it was a doubtful point whether they should succeed or be obliged to raise the siege, when a lucky accident happened which Bay of Venezuela, which runs up into the country for the proved favourable to their glory and their fortune. The space of about fifty leagues. The fort which was built at commander was killed, and the fort accidentally took fire; upon which the besiegers, taking advantage of this double calamity, made themselves masters of the place.

Morgan left his vessels at anchor, with a sufficient number of men to guard them, and sailed up the river in his sloops for thirty-three miles, till he came to Cruces, where it ceases to be navigable; and he then proceeded by land to Panama, which was only five leagues distant. Upon a ed; and the inhabitants had retired with their effects to the large and extensive plain which stretched out before the city, he met with a considerable body of troops, whom he put to flight with the greatest ease, and entered the city, which was now abandoned. Here were found prodigious treasures concealed in the wells and caves; some valuable commodities were also taken in the boats which were left aground lately erected, which they had the bootless satisfaction of at low water; and in the neighbouring forests were likewise found several rich deposits. Having burnt the city, deal of blood; for the inhabitants had already removed to they set sail with a great number of prisoners, who were a distance the most valuable part of their property. Ex- ransomed a few days afterwards, and arrived at the mouth of the Chagre with a prodigious booty.

In 1603 an expedition of the greatest consequence was formed by Van Horn, a native of Ostend, but who had served all his life among the French. His own intrepidity prevented his tolerating the least signs of cowardice amongst those who associated with him. In the heat of an engagement he went about his ship, observed his men Such was the religion of these barbarous people, who could in succession, and immediately killed those who shrunk at the sudden report of a pistol, gun, or cannon. This extraordinary discipline rendered him the terror of the But while they were idly dissipating the spoils which coward and the idol of the brave. In other respects he readily shared with the men of spirit and bravery the immense riches which were acquired in the course of his maica to attack Porto Bello. His plan of operations was so marauding expeditions. When he went upon such expewell contrived that he surprised and took the city without ditions, he generally sailed in his frigate, which was his own property. But his designs requiring greater numbers to carry them into execution, he called to his assistance Grammont, Godfrey, and Jonqué, three Frenchmen distinguished by their exploits, and Lawrence de Graff, a Dutchman, who had signalized himself still more than they Twelve hundred bucaneers joined themselves to these commanders, and sailed in six vessels for Vera Cruz.

> The darkness of the night favoured their landing, which was effected about three leagues from the place, where they arrived without being discovered. The governor, the fort, the barracks, and the posts of the greatest consequence, every thing, in short, which could occasion any resistance, were taken by the break of day. All the citizens, men, women, and children, were shut up in the churches, whither they had fled for shelter. At the door of each church were placed barrels of gunpowder to blow up the building. and a bucaneer, with a lighted match, was to set fire to it upon the least appearance of an insurrection.

> While the city was kept in this state of terror, it was easily pillaged; and after the bucaneers had carried off whatever was most valuable, they made a proposal to the citizens who were kept prisoners in the churches to ransom their lives and liberties by a contribution of L.437,500. This unfortunate people, who had neither eaten nor drunken fo

Bucaneer. three days, cheerfully accepted the terms which were offered them. Half of the money was paid the same day, and the other part was expected from the interior of the country, when there appeared on an eminence a considerable body of troops advancing, and near the port a fleet of seventeen ships from Europe. At the sight of this armament, the bucaneers, without any marks of surprise, retired quietly, with fifteen hundred slaves they had seized, as a trifling indemnification for the rest of the money they expected, the settling of which they referred to a more favourable opportunity. Their retreat was equally daring. They boldly sailed through the midst of the Spanish fleet, which let them pass without firing a single gun, and, in fact, seemed afraid of being attacked and beaten. Spaniards would not probably have escaped so easily, if the vessels of the pirates had not been laden with silver, or if the Spanish fleet had been freighted with any other effects but such merchandise as was little valued by these daring freebooters.

> A year had scarcely elapsed since their return from Mexico, when, on a sudden, they were all seized with a passion for going to plunder Peru. It is probable that the hopes of finding greater treasures upon a sea little frequented, than on one long exposed to piracies of this kind, was the cause of this expedition; but it is somewhat remarkable, that both the English and French, and the associations of these two nations, had projected this plan at the same time, without any communication, intercourse, or design of acting in concert with each other. About four thousand men were employed in this expedition. Some of them proceeded by Terra Firma, others by the Straits of Magelhaens, to the place which formed the object of their wishes; and if the intrepidity of these barbarians had been directed, under the influence of a skilful commander, to a single end, it is certain that they would have deprived the Spaniards of this important colony. But their natural character presented an invincible obstacle to so rare a union; for they always formed themselves into several distinct bodies, sometimes even so few in number as ten or twelve, who acted together, or separated, as whim or caprice dictated. Grognier, Lecuyer, Picard, and Le Sage, were the most distinguished officers among the French; David Samms, Peter Wilner, and Towley, among the English. :

> Such of these adventurers as had got into the South Sea by the Straits of Darien seized upon the first vessel which they found upon the coast; and their associates, who had sailed in their own vessels, were not much better provided. Weak, however, as they were, they several times beat the squadrons which were fitted out against them. But these victories were prejudicial to them, by interrupting their navigation; and when there were no more ships to be taken, they were continually obliged to make descents upon the coasts to get provisions, or to go by land in order to plunder those cities where the booty had been secured. They successively attacked Seppa, Puebla-Nuevo, Leon, Realejo, Puebla-Viejo, Chiriquita, Lesparso, Granada, Villia, Nicoy, Tecoanteca, Mucmeluna, Chiloteca, New Segovia, and Guayaquil, the most considerable of all these places.

Many of these places were taken by surprise, and most of them deserted by their inhabitants, who fled at the sight of the enemy. As soon as the bucaneers took a town, it was directly set on fire, unless a sum proportioned to its value was paid to save it. The prisoners taken in battle were massacred without mercy if they were not ransomed by the governor or some of the inhabitants; while gold, pearls, or precious stones, were the only things accepted of for the payment of their ransom. Silver being too common and too weighty for its current value, would have been troublesome to them. The chances of fortune, which neers.

seldom leave guilt unpunished, or adversity without a com- Bucaneer pensation for its suffering, atoned for the crimes committed in the conquest of the New World; and the Indians were amply avenged on the Spaniards.

While such piracies were being committed on the Southern Ocean, the Northern was threatened with the same by Grammont. He was a native of Paris, by birth a gentleman, and had distinguished himself in a military capacity in Europe; but his passion for wine, gaming, and women, had obliged him to join the pirates. Nevertheless he was affable, polite, generous, and eloquent; endued with a sound judgment, and a person of approved valour; qualities which soon made him be considered as the chief of the French bucaneers. As soon as it was known that he had taken up arms, he was immediately joined by a number of brave men. The governor of St Domingo, who had at length prevailed upon his master to approve of the project, equally wise and just, of fixing the pirates in some place, and inducing them to become cultivators, was desirous of preventing the concerted expedition, and forbade it in the king's name. But Grammont, who had a greater share of sense than his associates, was not on that account inclined to comply, and sternly replied, " How can Louis disapprove of a design he is unacquainted with, and which has been planned only a few days ago?" This answer highly pleased all the bucaneers, who directly embarked in 1685 to attack Campeachy.

They landed without opposition. But at some distance from the coast they were attacked by eight hundred Spaniards, who were beaten and pursued to the town, which both parties entered pell-mell together. The cannon they found there were immediately levelled against the citadel; but as these had very little effect, they were contriving some stratagem to enable them to become masters of the place, when intelligence was brought that it had been abandoned. There remained in it only a gunner, an Englishman, and an officer of signal courage, who chose rather to expose himself to the greatest extremities than basely to fly from the place with the rest. The commander of the bucaneers received him with marks of distinction, generously released him, gave him up all his effects, and, besides, complimented him with some valuable presents; such influence have courage and fidelity even on the minds of those who systematically violate all the rights of society.

The conquerors of Campeachy spent two months in searching the environs of the city to the extent of twelve or fifteen leagues, and in carrying off every thing which the inhabitants in their flight thought they had preserved. When all the treasure they had collected from every quarter was deposited in the ships, a proposal was made to the governor of the province, who still kept the field with nine hundred men, to ransom his capital city. His refusal determined them to burn it, and demolish the citadel. The French, on the festival of St Louis, were celebrating the anniversary of their king; and in the transports of their patriotism, intoxication, and national love of their prince, they burnt to the value of a million of logwood; a part, and a very considerable one too, of the spoil which they had made. After this singular and extravagant instance of folly, of which Frenchmen only would boast, they returned to St Domingo.

In 1697 twelve hundred bucaneers were induced to join a squadron of seven ships which sailed from Europe under the command of one Pointis, to attack the famous city of Carthagena. This was the most difficult enterprise which could be attempted in the New World. The situation of the port, the strength of the place, and the badness of the climate, were so many obstacles which would have seemed insurmountable to any but such men as the buca-But every obstacle yielded to their valour and Bucceilarii.

Buccari good fortune; the city was taken, and booty gained to the amount of L.1,750,000. Their rapacious commander, however, deprived them of the advantages resulting from their success. He scrupled not, as soon as they set sail, to offer L.5250 for the share of those who had been the chief instruments in procuring him so considerable a spoil.

The bucaneers, exasperated at this treatment, resolved immediately to board the vessel called the Sceptre, where Pointis himself was, and were with great difficulty prevented from assassinating him. They then set sail for Carthagena, where they amply repaid themselves for the losses they had sustained through the avarice of their late commander.

At length, after amassing all they could, these adventurers set sail, when unfortunately they met with a fleet of Dutch and English ships, then in alliance with Spain. Several of the pirates were either taken or sunk, with the cargoes they had on board; and the rest escaped to St Domingo.

Such was the last memorable event in the history of the The separation of the English and French, bucaneers. when the war on account of the Prince of Orange divided the two nations; the success of the means employed to promote the cultivation of land among their colonies, by the assistance of these enterprising men; the prudence evinced in selecting the most distinguished among them, and intrusting them with civil and military employments; and the protection afforded to the Spanish settlements, which till then had been a general object of plunder; all these circumstances, and various others, besides the impossibility of supplying the place of these remarkable men, who were continually dropping off, concurred to put an end to a society as extraordinary as any that ever existed. Without any regular system, without laws, without subordination, and even without any fixed revenue, they became the astonishment of the age in which they lived, as they will be also of pos-

BUCCARI, a free royal city in the Austrian province of Trieste, 5 miles E.S.E. of Fiume. It has considerable traffic in wine, wood, and charcoal, and a tunny fishery. Pop. about 2000. Long. 14. 32. E., Lat. 45. 18. N.

BUCCELLARII, an order of soldiery under the Greek emperors, appointed to guard and distribute the ammunition bread; though authors are somewhat divided as to their office and quality.

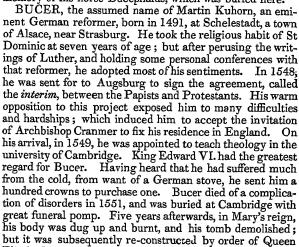

BUCCINA, an ancient kind of trumpet, originally formed of a spiral shell. It is very difficult to distinguish it from the cornu or horn, unless it was somewhat smaller, and not quite so curved; yet it certainly was of a different species, since we never read of the cornu in use with the watch, but only the buccina. In Scripture, a similar instrument, used both in war and in the temple, was called rams-horn, kiren jobel, and sepheroth hagijobelim. It was used among the Jews to proclaim their feast-days, new moons, jubilees, sabbatical years, and the like. At Lacedæmon, notice was given by the buccina when it was supper time; and at Rome it was used to proclaim the watches of the day and night; also at funerals, and at the commencement and at the conclusion of a festive entertainment. The sound of the buccina was called *buccinus*, or *bucinus*; and the musician who played on it buccinator. (See Blanchini, De Mus. Instrum. Veterum.

BUCCINO, a city in the province Principato-Citeriore of the kingdom of Naples. It stands on the river Botta, at its junction with the Negro, over which is an antique Roman bridge. Pop. 5320.

BUCENTAUR (βους and κένταυρος), the state galley of the Venetian doge, which was gilded from the prow to the stern, adorned with pillars, and covered overhead with an awning of purple silk. In this galley it was the custom annually on ascension-day for the doge, accompanied by the ambassadors and senators, to sail over a portion of the Adriatic, and dropping a ring into the sea, to espouse it in the name

of the republic, using the words Desponsamus te, mare, in signum veri perpetuique dominii.

BUCEPHALA, or BUCEPHALOS, a town built by Alexander the Great on the western side of the Hydaspis, in memory of his horse Bucephalus, which was buried here.

Elizabeth.

BUCH, LEOPOLD VON, an eminent German geologist and geographer, was born at Stolpe in Uckermark, April 25, 1774. In 1790 he studied at the mining school of Freiberg under the celebrated Werner. One of his fellow students at this school was the illustrious Alexander Von Humboldt. At the age of twenty-three he published his Attempt at a Mineralogical Description of Landeck, and another Attempt at a Geognostic Description of Silesia. He was at this time a zealous upholder of the Neptunian theory of his illustrious master. In 1797 he met his old school-fellow Von Humboldt at Salzbourg, and with him explored the geological formations of Styria and the adjoining Alps. In the spring of the following year, Von Buch extended his excursions into Italy, where his faith in the Neptunian theory was for the first time shaken. In his previous works he had advocated the aqueous origin of basaltic and other formations; he was now not less clearly convinced that these owed their existence to volcanic action. In 1799 he paid his first visit to Vesuvius, which he did not again see till 1805. when he was accompanied by Humboldt and Gay-Lussac. They had the good fortune to witness a remarkable eruption, which supplied Buch with data for refuting many erroneous ideas then entertained regarding the activity of volcanoes. Three years before, he had explored the south of France, and directed special attention to the extinct volcanoes of Auvergne. The aspect of the Puy de Dome, with its cone of trachyte and its strata of basaltic lava, induced him to abandon as untenable the doctrines of his master on the formation of these rocks. The scientific results of his investigations he embodied in his Geognostical Observations during Travels through Germany and Italy, Berlin, 1802-9, 2 vols. 8vo. From the south of Europe Von Buch now repaired to the north, and spent two years among the Scandinavian islands, making many important observations on the geography of plants, on climatology, and on geology. He also established the fact that the whole of Sweden is slowly but continuously rising above the level of the sea from Frederickshall to Abo. The details of these discoveries are given in his Travels through Norway and Lapland. Berlin, 1810. In 1815, he visited the Canary Islands in company with Christian Smith, the Norwegian botanist. His observations here convinced him that these and the other islands of the ocean owed their existence to volcanic action of the most intense kind, and that the groups of islands in the South Sea are the remains of a pre-existing continent. The physical

Buccina

Buchan Buchanan.

description of the Canary islands was published at Berlin in 1825. After leaving the Canaries, Von Buch proceeded to visit the Hebrides and the coast of Scotland and Ireland. His geological excursions even into countries already repeatedly visited were continued without interruption till his 78th year. Eight months before his death, he visited the mountains of Auvergne; and on returning home he read a paper on the Jurassic Formation before the Academy of Berlin. The manner of Von Buch's life was singularly favourable to scientific pursuits. He inherited from his father a fortune more than sufficient for all his wants. He was never married, and was completely unembarrassed by family ties. His excursions he always undertook on foot, with a staff in his hand, and the large pockets of his over-coat filled with papers and geological instruments. Under this guise, the passer-by would not easily have recognised the man whom Humboldt has pronounced the greatest geologist of our era. He died at Berlin on the 4th of March 1853.

In addition to the works already mentioned, Von Buch published others, of which we may specify the magnificent Geological Map of Germany, in 42 sheets. Berlin, 1832.

BUCHAN, a district of Scotland. See ABERDEENSHIRE. BUCHANAN, GEORGE, one of the most illustrious characters of the sixteenth century, was born about the beginning of February in the year 1506. His father was Thomas, the second son of Thomas Buchanan of Drummikill; his mother Agnes Heriot, of the family of Trabroun. The house from which he descended he has himself characterized as more remarkable for its antiquity than for its opulence. Thomas Buchanan the younger obtained from his father a grant of the farm of Mid-Leowen, or, as it is more commonly called, the Moss, situated in the parish of Killearn and county of Stirling. He died of the stone at a premature age; and, about the same period, the poet's grandfather found himself in a state of insolvency. The family, which had never been opulent, was thus reduced to extreme poverty: but his mother struggled hard with the misery of her condition; and all her children, five sons and three daughters, arrived at the age of maturity. In the year 1531, a lease of two farms near Cardross was granted by Robert Erskine, commendator of Dryburgh and Inchmahome, to her and three of her sons, Patrick, Alexander, and George. One of her daughters appears to have married a person of the name of Morison; for Alexander Morison, the son of Buchanan's sister, published an edition of his uncle's paraphrase of the Psalms. Her third son, whose extraordinary attainments have rendered the family illustrious, is reported by oral tradition to have been indebted for the rudiments of learning to Killearn school, which long continued to maintain a considerable reputation. Mid-Leowen, which stands on the banks of the Blane, is situated at the distance of about two miles from the village; and it may be conjectured that the future poet and statesman daily walked to school, and carried along with him his homely repast. Dr Mackenzie, whose authority is extremely slender, asserts that he was partly educated at the school of Dunbarton. His very promising talents recommended him to the favour and protection of his maternal uncle, James Heriot, who, apparently in the year 1520, sent him to prosecute his studies in the university of Paris. It was here that he began to cultivate his poetical talents; partly impelled, as he informs us, by the natural temperament of his mind, partly by the necessity of performing the usual exercises prescribed to younger students. Some of the French writers most capable of estimating his attainments, have not neglected to record his obligations to their country: Vavasseur has remarked that, although a Scottishman by birth, he might well pass for a French poet, since all that he knew of polite literature, and particularly of poetry,

he had acquired in France. Buchanan did not profess to Buchanan be one of those bright geniuses who can master a new language every six weeks; he incidentally states that his knowledge of Latin was the result of much youthful labour. The Greek tongue, in which he likewise attained to proficiency, he acquired without the aid of a preceptor. The current speech of his native district at that period may be supposed to have been Gaelic. Of this language it is at least certain that he possessed some knowledge; and an anecdote has been related which at once confirms this supposition, and illustrates his peculiar vein of humour. When in France, having met with a woman who was said to be possessed with the devil, and who professed to speak all languages, he accosted her in Gaelic: as neither she nor her familiar returned any answer, he took a protest that the devil was ignorant of that

Within the space of two years after his arrival in Paris, his uncle died, and left him exposed to want in a foreign country: his misery was increased by a violent distemper, which had perhaps been occasioned by poverty and mortification; and in this state of hopeless languor he returned to Scotland at the critical age of sixteen. Having devoted the best part of a year to the recovery of his health, he next assumed the character of a soldier, and served along with the auxiliaries whom the duke of Albany had conducted from France. The Scottish forces, commanded by the regent in person, marched towards the borders of England, and, about the end of October 1523, laid siege to the castle of Werk. The auxiliaries carried the exterior wall by assault, but could not long occupy the station which they had gained. The large area between the two ramparts, intended as a receptacle, during the time of war, for the cattle and stores of the neighbouring peasantry, was at this crisis replenished with materials of a combustible nature; and when the garrison found themselves repulsed by the French soldiers, they set fire to the straw, and speedily expelled their enemies by the flames and smoke. During the two following days, the assailants persisted in battering the inner wall: when they had effected a sufficient breach, the French soldiers again rushed to the attack, and surmounted the ruins; but they were so fiercely assaulted by missile weapons from the inner tower, which was yet entire, that after having sustained some loss, they were compelled to retreat, and repassed the Tweed. The duke, finding his native troops disaffected, and the army on the English frontier too formidable from its numbers, removed his camp on the 11th of November; and as he marched towards Lauder after midnight, his army was terribly annoyed by a sudden storm of snow.

Buchanan, who belonged to a fierce and warlike nation, seems to have caught some portion of the military ardour. It was his youthful curiosity respecting the profession of arms which had thus prompted him to mingle in danger; and he was persuaded that there is a very close affinity between the studies of literature and of war. In his history of Scotland, written at an advanced age, he often describes feats of chivalry with great animation. But his experience in the course of this inglorious campaign did not render him more enamoured of a military life: the hardships which he had undergone reduced him to his former state of languor; and during the rest of the winter he was confined to bed. In the beginning of the ensuing spring, when he had completed the eighteenth year of his age, he was sent to the university of St Andrews, where he and his brother Patrick were at the same time matriculated in what was then called the Pedagogy, and afterwards St Mary's College. On the 3d of October 1525 George Buchanan took the degree of A. B.; and it

Buchanan appears from the faculty register that he was then a Buchanan entered upon his new charge; for in the course Buchanan taught by John Mair, a celebrated doctor of the Sorbonne. Buchanan informs us that it was to hear his prelections that he had been sent to St Andrews, and that he afterwards followed Mair to France. It has been very confidently stated, that he was now a dependent on the bounty of this venerable commentator on Peter of Lombardy; and if the fact could be established by any competent evidence, the character of Buchanan must be subjected to severe reprehension; for he mentions his supposed benefactor in terms which convey no suggestion of gratitude. Of this generous patronage, however, there is not even the faintest shadow of evidence; and such a tale manifestly originated from the misinterpretation of a very

unequivocal passage in Buchanan's account of his own life.

Upon his return to France, he became a student in the Scottish College of Paris. On the 10th of October 1527, he was incorporated as A.B., and he took the degree of A. M. next March. During the year 1529, he was a candidate for the office of procurator of the German nation; but his purblind countryman Robert Wauchope, who was afterwards titular archbishop of Armagh, and who sat in the council of Trent, was then elected for the ninth time. Buchanan was thus repulsed on the fifth of May, but on the third of June 1530 he was more successful. Before this period, the tenets of Luther had begun to be widely disseminated, and Buchanan was now added to the number of his converts. Having for the space of two years continued to struggle with the iniquity of fortune, he was appointed a regent or professor in the College of St Barbe, where he taught grammar for about three years. His eminent qualifications for such an employment will not be questioned, but his services do not seem to have procured him any splendid remuneration: in an elegy, apparently composed about this period of his life, he exhibits a dismal picture of the miseries to which the Parisian professors of humanity were then exposed. His appointment seems to have taken place in the year 1529. Gilbert Kennedy, earl of Cassillis, who was residing near this college, having become acquainted with Buchanan, admired his literary talents, and was delighted with his conversation: he was therefore solicitous to retain so accomplished a preceptor; and their closer connexion probably commenced in the year 1532. The first work that Buchanan committed to the press was a translation of the famous Thomas Linacre's rudiments of Latin grammar; which he inscribed to Lord Cassillis, "a youth of the most promising talents, and of an excellent disposition." This Latin version was printed at Paris in 1533.

After he had resided with his pupil for five years, they both returned to Scotland. At this period the earl had reached the age of majority; and Buchanan might only embrace a favourable opportunity of revisiting his relations Their connexion however was not immeand friends. diately dissolved. While he was residing at the earl's seat in Ayrshire, he composed a little poem which rendered him extremely obnoxious to the ecclesiastics. In this poem, which bears the title of Somnium, and is a happy imitation of Dunbar, he expresses his own abhorrence of a monastic life, and stigmatizes the impudence and hyprocrisy of the Franciscan friars. It was his original intention to resume his former occupations in France, but James the Fifth retained him in the capacity of preceptor to one of his natural sons. This son was not, as has generally been supposed, the celebrated James Stewart, who afterwards became regent of the kingdom, but another who bore the same baptismal name. His mother was Elizabeth Shaw, of the family of Sauchie; and he died in the year 1548. It was perhaps in the year 1537 that

pauper or exhibitioner. In this college logic was then of that year the king made an arrangement with respect to his four sons. The abbacies of Melrose and Kelso were secured in the name of Buchanan's pupil, who was the eldest. The preferment of a profane scoffer at priests must have augmented the spleen of the clergy; and the Franciscan friars, still smarting from his Somnium, found means of representing him to the king as a man of depraved morals and of dubious faith. But James had formerly begun to discover their real character; and the part which he supposed them to have acted in a late conspiracy against his own life, had not contributed to diminish his antipathy. Instead of consigning the poet to disgrace or punishment, the king, who was aware that private resentment would improve the edge of his satire, enjoined him in the presence of many courtiers to renew his well-directed attack on the same pious fathers. He accordingly applied himself to the composition of the poem afterwards published under the title of Franciscanus; and, to satisfy the king's impatience, soon presented him with a specimen. This production, as it now appears in its finished state, may be pronounced one of the most pungent satires which any language can exhibit. No class of men was ever more completely exposed to ridicule and infamy; nor is it astonishing that the popish clergy afterwards regarded the author with implacable hatred

But the church being infallible, he speedily recognized the danger of accosting its retainers by their proper names. At the beginning of the year 1539, many individuals suspected of Lutheranism were involved in the horrors of persecution. Towards the close of February, five were committed to the flames, nine made a formal recantation of their supposed errors, and many were driven into exile. Buchanan had been comprehended in this general arrest; and after he was committed to custody, Cardinal Beaton endeavoured to accelerate his doom by tendering to the king a sum of money as the price of his blood. Of this circumstance Buchanan was apprized by some of his friends at court; and his knowledge of the king's rapacity must have augmented all the terrors of his situation. Stimulated by the thoughts of increasing danger, he made his escape through the window of the apartment in which he was confined; but he had soon to encounter new disasters. When he reached the frontier of the two kingdoms, he was molested by the freebooters, who at that time were its sole inhabitants; and his life was again exposed to jeopardy from the contagion of a pestilential disease, which then raged in the north of England. On his arrival in London, he experienced the friendship of Sir John Rainsford, an English knight, who is mentioned as the only person that protected him against the fury of the papists. He met with no particular inducement to continue his residence in England, which was then governed by an atrocious tyrant. The civilization of France, as well as the particular intimacies which he had formed in that country, led him to adopt the resolution of returning to Paris: but, on his arrival, he found that Cardinal Beaton was residing there in the capacity of an ambassador; and his friend Andrew Govea, a native of Portugal, having invited him to Bordeaux, he did not hesitate to embrace such an opportunity of removing himself beyond the reach of the cardinal's deadly hatred. Of the College of Guienne, lately founded in that city, Govea had been nominated principal; and Buchanan, evidently on his recommendation, was now appointed one of the professors. Here he must have fixed his residence before the close of the year; for to Charles the Fifth, who made his solemn entry into Bordeaux on the first of December 1539, he presented a poem in the name of the college.

The task assigned him at Bordeaux was that of teach-

Buchanan ing the Latin language. For an occupation of this kind he seems to have entertained no particular affection; but although sufficiently laborious, it never impaired the native elevation of his mind. His poetical studies he now prosecuted with great ardour; during the three years of his residence at Bordeaux, he completed four tragedies, together with various other poems. The earliest of his dramatic compositions bears the title of Baptistes. He had applied himself to the study of the Greek language without the aid of a preceptor, and as a useful exercise had executed a translation of the Medea of Euripides. This version he now delivered to the academical stage, and afterwards suffered it to be printed. Those two tragedies were performed with a degree of applause which almost exceeded his hopes. He afterwards completed his Jephthes, and translated Alcestis, another drama of his favourite poet. These last productions, as he originally intended them for publication, were elaborated with superior diligence. The tragedy of Jephthes is conformable to the models of the Grecian theatre, and is not destitute of interest. The subject is highly dramatic; it is a subject which his great exemplar Euripides might have been inclined to select. The situation of a father who had unwarily subjected himself to the dreadful necessity of sacrificing a beloved and only child, the repugnant and excruciating sensations of the mother, the daughter's mingled sentiments of heroism and timidity, are delineated with considerable felicity of dramatic conception. The tender or pathetic was not however the peculiar province of Buchanan, whose talents were bold, masculine, and commanding. The Baptistes, although inferior to the other tragedy in dramatic interest, is more strongly impregnated with the author's characteristic sentiments. Its great theme is civil and religious liberty; and against tyranny and priestcraft the poet frequently expresses himself with astonishing boldness. Some of his allusions bear a very easy application to the late conduct of Cardinal Beaton. In the tragedies of the ancient Greek poets, what is termed the prologue is always an essential part of the drama; but the prologue of the Baptistes resembles those of Terence. Buchanan seems to have adopted this model, because it afforded him a better opportunity of preparing his auditors for the bold sentiments which they

> During the term of his residence in the College of Guienne, the satirist of the Scottish clergy did not find himself totally secure from danger. The cardinal, in a letter addressed to the archbishop of Bordeaux, requested him to secure the person of the heretical poet; but as his letter had been entrusted to the care of some individual much interested in the welfare of Buchanan, he was suffered to remain without molestation. Still however he found himself annoyed by the threats of the cardinal and the grey friars; but the death of King James, and the appearance of a dreadful plague in Guienne, alleviated his former apprehensions. Having resided three years at Bordeaux, he returned to Paris. In 1544 he was officiating as a regent in the college of Cardinal le Moine; and he apparently retained the same station till 1547. About this period he was miserably tormented with the gout. The ardour of his fancy was however undiminished: in an interesting elegy, composed in 1544, and addressed to his late colleagues Tastæus and Tevius, he exhibits a dismal picture of his own situation, and gratefully commemorates the assiduous attentions of his present colleagues Turnebus and Gelida. It is remarked by a French historian, that three of the most learned men in the world then taught humanity in the same college. The first class was taught by Turnebus, the second by Buchanan, and the third by Muretus.

were about to hear.

The king of Portugal had recently founded the univer Buchanan, sity of Coimbra; and as his own dominions could not afford a sufficient supply of able professors, he invited Andrew Govea to preside over the new institution, and to conduct from France a considerable number of proficients in philosophy and ancient literature. Govea accordingly returned to his native country in the year 1547, accompanied by Buchanan and other associates. The affairs of Europe presented an alarming aspect; and Portugal seemed to be almost the only corner free from tumults. To the proposals of Govea he had not only lent a willing ear, but was so much satisfied with the character of his associates, that he also persuaded his brother Patrick to join this famous colony. To several of its members he had formerly been attached by the strictest ties of friendship; these were Gruchius, Garentæus, Tevius, and Vinetus, who have all distinguished themselves by the publication of learned works. The other scholars of whom it consisted were Arnoldus Fabricius, John Costa, and Anthony Mendez, who are not known as authors: the first was a native of Bazats, the other two were Portugueze. All these professors except P. Buchanan and Fabricius had taught in the College of Guienne. To this catalogue Dempster has added other two Scottish names, those of John Rutherford and William Ramsay. Govea died in the year 1548; and after Buchanan and his associates were deprived of his protection, the Portugueze began to persecute them with unrelenting bigotry. Three of their number were thrown into the dungeons of the inquisition, and after having been subjected to a tedious imprisonment, were at length arraigned at this direful tribunal. According to the usual practice, they were not confronted with their accusers, of whose very names they were ignorant. As they could not be convicted of any crime, they were overwhelmed with reproaches, and again committed to custody.

Buchanan had attracted an unusual degree of indignation. He was accused of having written an impious poem against the Franciscans, yet with the nature of that poem the inquisitors were totally unacquainted. He was also charged with the heinous crime of eating flesh in Lent, and yet with respect to that very article, not a single individual in Portugal deemed it necessary to practise abstinence. Some of his strictures relative to monks were registered against him, but they were such as monks only could regard as criminal. He was moreover accused of having alleged, in a conversation with some young Portugueze, that with respect to the eucharist, St Augustin appeared to him to be strongly inclined towards the opinion condemned by the church of Rome. Two witnesses, whom he afterwards discovered to be Ferrerius and Talpin, made a formal deposition of their having been assured by several respectable informants that Buchanan was disaffected to the Romish faith. After the inquisitors had harassed him for the space of nearly two years and a half, they confined him to a monastery, for the purpose of receiving edifying lessons from the monks; whom, with due discrimination, he represents as men by no means destitute of humanity, but totally unacquainted with religion. In their custody he continued several months; and it was about this period that he began his version of the Psalms, afterwards brought to so happy a conclusion. That this translation was a penance imposed upon him by his illiterate guardians, is only to be considered as an idle tale: it is much more probable that a large proportion of the good monks were incapable of reading the Psalms in their native language. When he was at length restored to liberty, he solicited the king's permission to return to France: he was however requested to protract his residence in Portugal, and was presented with a small sum of

Buchanan money till he should be promoted to some station worthy she insensible of his powerful claims upon the protection Buchanan beautiful poem, entitled Desiderium Lutetiæ, and apparently composed before his retreat from Portugal, he pahe represents under the allegory of a pastoral mistress. Having embarked in a Candian vessel, which he found in the port of Lisbon, he was safely conveyed to England. Here however he did not long remain, though he might have procured some creditable situation, which he himself Paris, he was appointed a regent in the College of Boncourt; and in the year 1555 he was called from that charge by the celebrated Comte de Brissac, who engaged him as the domestic tutor of his son Timoleon de Cossé

During the five years of his connexion with this illustrious family, he alternately resided in Italy and France. In the mean time several of his poetical works were published at Paris. In 1556 appeared the earliest specimen of his poetical paraphrase of the Psalms; and his version of the Alcestis of Euripides was printed in the course of the subsequent year. This tragedy he dedicated to Margaret, the daughter of Francis the First, a munificent princess, whose favour he seems to have enjoyed. His engagement with the family of Brissac terminated in the year was perhaps the alarming aspect of affairs in France that induced Buchanan to hasten his return to his own country. The precise period of his return has not been ascertained; but it is certain that he was at the Scottish court in January 1562, and that in the month of April he was officiating as classical tutor to the queen, who was then in the twentieth year of her age. Every afternoon she read with Buchanan a portion of Livy. This author is not commonly recommended to very young scholars; and indeed the study of the Latin language is known to have occupied a considerable share of her previous attention.

The era at which Buchanan finally returned to his native country was highly important. After a violent struggle against the ancient superstition, the principles of the reformed faith received the sanction of parliament in the year 1560. For the doctrines of the reformation he had long cherished a secret affection; and he now professed himself a member of the protestant church of Scotland. The earl of Murray, as commendator of the priory of St Andrews, possessed the right of nominating the principal of St Leonard's College; and a vacancy occurring in the year 1566, he conferred the office upon Buchanan. The tenure of his appointment seems to have imposed upon him the task of reading occasional lectures on divinity.

On his return to Scotland, he determined to publish, in a correct manner, the poetical works which he had composed at many different periods of his variegated life. Of his admirable version of the Psalms, the date of the first complete edition is uncertain, for it has been omitted in the book itself; but a second edition appeared in the year 1566. When he consigned his Psalms to the printer, he was probably engaged in superintending the classical studies of Queen Mary; and to that accomplished and hopeful princess he gratefully inscribed a work destined for immortality. His dedication has received, and indeed is entitled to the highest commendation for its terseness, compression, and delicacy. Buchanan had recommended himself to the queen by other poetical tributes: one of his most beautiful productions is the Epithalamium which he composed on her first nuptials; and several of his mis-

of his talents; but his ambition of Portugueze preferment of his country. In the year 1564 she had rewarded his liwas not perhaps very violent, for he still remembered with terary merit by conferring upon him the temporalities of regret the learned and interesting society of Paris. In a Crossragwell Abbey, which amounted in annual valuation to the sum of L.500 in Scottish currency. The abbacy had become vacant by the death of Quintin Kennedy. thetically bewails his absence from that metropolis, which But while he thus enjoyed the favour of the queen, he did not neglect his powerful friend the earl of Murray. To that nobleman he inscribed his Franciscanus during the same year. The date of the earliest edition is uncertain; but the dedication was written at St Andrews on the 5th of June 1564, when he was perhaps residing in the earl's has not particularized. He returned to France about house. He at the same time prepared for the press his the beginning of the year 1553. Soon after his arrival in miscellany entitled Fratres Fraterrimi, a collection of satires, almost exclusively directed against the impurities of the popish church. The absurdity of its doctrines, and the immoral lives of its priests, afforded him an ample field for the exercise of his formidable talents; and he has alternately employed the weapons of sarcastic irony and vehement indignation. His admirable wit and address must have contributed to promote the cause which Luther had so ardently espoused; and Buchanan ought also to be classed with the most illustrious of the reformers. In the year 1567 he published another collection, consisting of *Elegia*, Silva, Hendecasyllabi. To this miscellany was prefixed an epistle to his friend Peter Daniel, a learned man, who is still remembered for his edition of Virgil, with the commentary of Servius. His Miscellanea were 1560, when the civil war had already commenced. It not printed till after the death of the author. Of his short and miscellaneous pieces the subjects are sometimes indeed of a trivial nature; but even those lighter efforts serve to evince the wonderful versatility of his mind. His epigrams, which consist of three books, are not the least remarkable of his compositions; the terseness of the diction, the ingenuity and pungency of the thoughts, have deservedly placed them in a very high class.

Of the general assembly convened at Edinburgh on the 25th of December 1563, Buchanan had sat as a member, and had been appointed one of the commissioners for revising the Book of Discipline. He sat in the June assemblies of 1564 and the three following years, and likewise in that of December 1567. He was a member of various committees, and evidently had no small influence in the affairs of the church. Of the assembly which met at Edinburgh on the 25th of June 1567, he had the honour of being chosen moderator.

The nation was now in a state of anarchy, and the change of affairs drew Buchanan into the vortex of poli-The recent conduct of Queen Mary, whom he once regarded in so favourable a light, had offered such flagrant insults to virtue and decorum, that his attachment was at length converted into the strongest antipathy. The simple and uncontroverted history of her proceedings, from the period of her pretended reconciliation with Darnley to that of her marriage with Bothwell, exhibits such strong moral evidence of her criminality as it seems impossible for an unprejudiced mind to resist. "There are indeed," as Mr Hume has remarked, "three events in our history, which may be regarded as touchstones of party-men. An English Whig, who asserts the reality of the popish plot, an Irish Catholic, who denies the massacre of 1641, and a Scotch Jacobite, who maintains the innocence of Queen Mary, must be considered as men beyond the reach of argument or reason, and must be left to their prejudices." Buchanan accompanied the regent Murray when he visited England for the purpose of appearing before Elizabeth's commissioners. On the 4th of October 1568, the conference was opened at York; but in the course of the ensuing month it was transferred to Westcellaneous poems relate to the same princess. Nor was minster. This singular transaction was managed with

Buchanan great address on both sides: nor was Buchanan the least powerful of Murray's coadjutors; he composed in Latin a detection of Queen Mary's actions, which was produced to the commissioners at Westminster, and was afterwards circulated with great industry by the English court. His engaging in a task of this kind, as well as his mode of executing it, has frequently been urged as a proof of his moral depravity; and, to augment his delinquency, the benefits conferred upon him by the unfortunate queen have been multiplied with considerable ingenuity. It is certain that she granted him the temporalities of Crossragwell Abbey; and beyond this single point the evidence cannot be extended. Nor was this reward bestowed upon a man who had performed no correspondent services. He had officiated as her classical tutor, and had composed various poems for the entertainment of the Scottish court; but the dedication of his Psalms might almost be considered as equivalent to any reward which she conferred. If Buchanan celebrated her in his poetical capacity, and before she ceased to be an object of praise, it certainly was not incumbent upon him to approve the atrocious actions which she afterwards performed. The duty which he owed to his country was a prior consideration, and with that duty his further adherence to the infatuated princess was utterly incompatible.

The earl of Murray and his associates returned to Scotland in the beginning of the ensuing year. Buchanan's Detection, which was not published till 1571, seems to have been entrusted to Dr Wilson, who is supposed by Mr Laing to have added the "Actio contra Mariam Scotorum Reginam," and the Latin translation of Mary's first three letters to the earl of Bothwell. The good regent did not long survive those transactions: on the 23d of January 1570 he was shot in the street of Linlithgow by Hamilton of Bothwellhaugh, whom his clemency had formerly rescued from an ignominious death. The assassin had been confirmed in his enterprise by the approbation of his powerful kinsmen. The indignation of Buchanan was naturally roused against the house of Hamilton; and he had sufficient cause to suspect that their dangerous schemes were not yet completed. Under such impressions as these, he composed "Ane Admonitioun direct to the trew Lordis, Mantenaris of the Kingis Graces Authoritie;" in which he earnestly adjured them to protect the young king, and the children of the late regent, from the perils which seemed to await them. It was apparently in the course of the same year, 1570, that he wrote another Scottish tract, entitled Chamæleon. In this satirical production he very successfully exposes the wavering politics of the famous secretary Maitland. Soon after the assassination of his illustrious friend, Buchanan was removed to a situation of no small importance; he was appointed one of the preceptors of the young king. For this preferment he appears to have been indebted to the privy council, and others of the nobility and gentry, who assembled in consequence of that disastrous event, for the purpose of providing for the public security.

During his infancy, the prince had been committed to the charge of the earl of Mar, a nobleman of the most unblemished integrity. In 1570, when Buchanan entered upon his office, James was only four years of age. The chief superintendence of his education was left to the earl's brother, Alexander Erskine. The preceptors associated with Buchanan, were Peter Young, and the two abbots of Cambuskenneth and Dryburgh, both related to the noble family of Mar. Young, who was respectable for his capacity and learning, was of a disposition naturally mild; and his attention to his future interest rendered him cautious of offending a pupil who was soon to be the dispenser of public favours. But the lofty and independent

spirit of Buchanan was not to be controlled by the mere Buchanan suggestions of cold caution: the honourable task which the voice of his country had assigned to his old age, he discharged with simple integrity, and, so far as he himself was concerned, he was little solicitous what impression the strictness of his discipline might leave on the mind of his royal pupil. James, who was of a timid nature, long remembered the commanding aspect which his illustrious preceptor had assumed. He was accustomed to say of some individual high in office, "that he ever trembled at his approach, it minded him so of his pedagogue." The young monarch's proficiency in letters was such as reflected no discredit on his early instructors. Buchanan made him a scholar, and nature had destined him for a pedant.

Nor was this the only preferment which he now obtained. His first civil appointment, which he seems to have retained but a short time, was that of director of the chancery. The keeper of the privy seal, John, afterwards Lord Maitland of Thirlstane, having been deprived of his office on account of his adherence to the queen, it was conferred upon Buchanan in the year 1570. The earl of Lennox was at that time regent. His situation as lord privy seal was undoubtedly honourable, and probably lucrative. It entitled him to a seat in parliament. This office he retained for several years; for under the date of November 1579, he is enumerated among the ordinary officers of state entitled to a seat in the council. His talents and his station evidently gave him no small share of influence, and he was associated in various commissions

of importance.

Notwithstanding the precarious state of his health, and the number of his avocations, he found leisure to compose a most profound and masterly compendium of political philosophy. It is entitled De Jure Regni apud Scotos, and was first printed at Edinburgh in the year 1579. Although it professedly relates to the rights of the crown of Scotland, it comprehends a subtile and eloquent delineation of the general principles of government. The work is exhibited in the form of a dialogue between the author and Thomas the son of Sir Richard Maitland. Buchanan's dialogue excited a degree of attention which will not appear surprising, when we consider the high reputation of the author, and the boldness of the precepts which he inculcates. In the course of a few years, his tenets were formally attacked by his learned countrymen Blackwood, Winzet, and Barclay, all of whom were zealous Catholics. Some of Barclay's arguments were long afterwards refuted by Locke. Buchanan was also attacked, though in an indirect manner, by Sir Thomas Craig, and by Sir John Wemyss. Craig was a lawyer of much learning and ability, and his treatise on the feudal law still continues to be held in great estimation. Sir George Mackenzie, the servile tool of a most profligate court, undertook to defend against Buchanan the same maxims of polity; and it must be acknowledged that " the right divine of kings to govern wrong," was a very suitable doctrine for the ministers of Charles and James. In the course of the seventeenth century, his leading principles were also oppugned by Sir Lewis Stewart, a lawyer, and by Sir James Turner, a soldier. The former wrote in Latin, the latter in English, but neither of their productions has been printed; and the republic of letters has sustained no detriment by their long suppression. He was incidentally assailed by many foreign authors, who seem in general to have been bewildered by the current doctrine of the divine and indefeasible right of kings, and the passive obedience of subjects. This was indeed the doctrine of Catholics and Protestants, of civilians and divines. Grotius, though born under a free republic, and certainly a man of a great and liberal mind, did not entirely escape the contamination of

Buchanan those slavish maxims which were so prevalent during the may be considered as amply sufficient, to ascertain the Buchanan age in which he lived: the right of resisting any superior power which happens to be established, he has discussed in a manner that could hardly offend the completest despot in Europe. There is perhaps too much justice in the remark of Rousseau, that it is his most common method of reasoning, to establish the right by the fact. It is on passages of scripture which are not didactic or exegetical, but merely historical. This obsolete perversion they seem to have derived from the authority of those early theologians who are commonly styled the fathers of the church; and who, if not always very safe guides in morality and in biblical criticism, are certainly exceptionable guides in political science. The degrading doctrine of passive obedience was inculcated by Salmasius, Bochart, Usher, and indeed by several very able men who approached much nearer to our own times: it was even inculcated by the famous Dr Berkeley, in some metaphysical discourses preached before the university of Dublin in the year 1712. It is however a doctrine which no Briton, capable of reflection, and possessed of ordinary sincerity, will now hesitate a single moment in rejecting with the utmost indignation.

But the full measure of Buchanan's ignominy has not yet been related. In the year 1584 the parliament condemned his dialogue and history as unfit to remain for records of truth to posterity; and, under a penalty of two hundred pounds, commanded every person who possessed copies to surrender them within forty days, in order that they might be purged of "the offensive and extraordinary matters" which they contained. In 1664, the privy council of Scotland issued a proclamation, prohibiting all subjects, of whatever degree, quality, or rank, from transcribing or circulating any copies of a manuscript translation of the dialogue. And in 1683, the loyal and orthodox university of Oxford doomed to the flames the political works of Buchanan, Milton, Languet, and other heretics. This university, says Cunningham, debauched the minds of the youth with its slavish doctrines, and pronounced a severe judgment against Buchanan for vindicating the rights of the kingdom. The Scottish legislature, the English university, and the popish tribunal of the inquisition, seem to have viewed this unfortunate speculator with equal abhorrence. And what are the terrible doctrines that once excited so violent an alarm? Buchanan maintains that all power is derived from the people; that it is more safe to entrust our liberties to the definite protection of the laws, than to the precarious discretion of the king; that the king is bound by those conditions under which the supreme power was originally committed to his hands; that it is lawful to resist, and even to punish tyrants. When he speaks of the people as opposed to the king, he evidently includes every individual of the nation except one. And is a race of intelligent beings to be assimilated to a tract of land, or a litter of pigs; to be considered, absolutely and unconditionally, as the lawful patrimony of a family which either merit, accident, or crime, may originally have elevated to the summit of power? In this country and this age it certainly is not necessary to remark, that man can neither inherit nor possess a right of property in his fellow-creatures. What is termed loyalty, may, according to the circumstances of the case, be either a virtue or a vice. Loyalty to Antoninus and loyalty to Nero must assuredly have flowed from different sources. If the Roman people had endeavoured to compass the death of Nero, would this have been foul and unnatural rebellion? The doctrine of punishing tyrants in their persons, either by a private arm, or by the public forms of

previous right of forcible resistance. It will always be extremely difficult, if not impossible, to find a competent tribunal and impartial judges. But if mankind are at length roused to the redress of enormous wrongs, the prince who has either committed or sanctioned an habitual violation of the best rights of the people, will seldom one general fault of those writers, to found their theories fail to meet with an adequate reward; and in spite of all the slavish theories of his priests and lawyers, mankind will not long be reasoned out of the strongest feelings of their nature. Divine right and passive obedience were never more strenuously inculcated, than in the reign of Charles the First.

> In the seventy-fourth year of his age, Buchanan composed a brief sketch of his own life. The last production which he lived to complete was his history of Scotland, Rerum Scoticarum Historia. In the year 1582, it issued from the press of Alexander Arbuthnot, printer to the king. It bears the royal privilege, and is dedicated to the young monarch. Between the original formation of his plan, and the publication of the history itself, nearly twenty years must have elapsed; but it is to be supposed that he long revolved the subject in his mind, and had proceeded to amass the greater part of his materials, before he applied himself to its composition; and during that interval, his attention had been distracted by various pur-

suits, political as well as literary.

Buchanan has divided his history into twenty books The first three ought rather to have been exhibited in the form of an introductory dissertation, for the historical narrative properly commences with the fourth book. His preliminary enquiries are directed to the geographical situation, the nature of the soil and climate, the ancient names and manners, and the primitive inhabitants, of the British islands. The third book consists of a series of quotations from the Greek and Latin authors. The whole of this introductory part displays his usual erudition and sagacity; and, in the opinion of Archbishop Usher, no writer had investigated the antiquities of his country with superior diligence. In these disquisitions he evinces his knowledge of the Celtic as well as of the classical languages. In the earlier part of his narrative, he has reposed too much confidence on his predecessor Boyce. He appeals to several other Scottish historians; and he unquestionably had access to historical documents which are no longer extant. He has occasionally availed himself of the collateral aid of the English and French writers. Of the earlier reigns his sketch is brief and rapid; nor has he attempted to establish any chronological notation till he descends to the beginning of the fifth century. It must indeed be acknowledged that he has repeated the fabulous line of our ancient kings; but that continued till a much later period to be regarded as an article of national faith. Like most of the classical historians, he is too remiss in marking the chronology of the different facts which he relates. From the reign of the great King Robert, his narrative becomes much more copious and interesting; but the history of his own times, which were pregnant with remarkable events, occupies far the largest proportion of his twenty books. In some of the transactions which he records, his own affections and passions were deeply concerned, and might not unreasonably be expected to impart some tincture to his style. His indignation against the ill-fated queen he shared with a very large proportion of his fellow-subjects; and many of her actions were such as could not fail of exciting the antipathy of every well-regulated mind. The composition of his history betrays no symptoms of the author's old age and infirmities; his style is not merely distinguished by its corlaw, is indeed of a delicate and dangerous nature; and it rectness and elegance, it breathes all the fervent animaBuchanan tion of youthful genius. The noble ideas which so frequently rise in his mind, he always expresses in language of correspondent dignity. His narrative is extremely perspicuous, variegated, and interesting; it is seldom deficient, and never redundant. His moral and political reflections are profound and masterly. He is ready upon all occasions to vindicate the unalienable rights of mankind; and he uniformly delivers his sentiments with a noble freedom and energy. It is with the utmost propriety that the learned Conring has commended him as a man of exquisite judgment. Thuanus remarks that although much of his time had been spent in scholastic occupations, yet his history might be supposed the production of a man whose whole life had been exercised in the political transactions of the state; the felicity of his genius, and the greatness of his mind, having enabled him so completely to remove every impediment incident to an obscure and humble lot. And, in the opinion of Bishop Burnet, "his stile is so natural and nervous, and his reflections on things are so solid, that he is justly reckoned the greatest and best of our modern authors."

The publication of this great work he did not long survive. His usual vein of pleasantry did not entirely desert him on his death-bed. When visited by John Davidson, a distinguished clergyman, he devoutly expressed his reliance on the atoning blood of Christ; but he could not refrain from introducing some facetious reflections on the absurdities of the mass. He expired soon after five o'clock in the morning of Friday the 28th of September 1582, at the age of seventy-six years and nearly eight months. His remains were interred in the cemetery of the Greyfriars: Calderwood informs us that the funeral took place on Saturday, and was attended by "a great company of

the faithful.

Buchanan had experienced many of the vicissitudes of human life, and had been tried by prosperity as well as adversity. His moral and intellectual character procured him the same high respect from the most enlightened of his contemporaries. His stern integrity, his love of his country and of mankind, cannot fail of endearing his memory to those who possess congenial qualities; and such errors as he actually committed, will not perhaps be deemed unpardonable by those who recollect the condition of humanity. He was subject to the nice and irritable feelings which frequently attend exalted genius, enthusiastic in his attachment, and violent in his resentment, equally sincere in his love and in his hatred. His friends, among whom he numbered some of the most distinguished characters of the age, regarded him with a warmth of affection which intellectual eminence cannot alone secure. His conversation was alternately facetious and instructive: his wit and humour are still proverbial among his countrymen. Such of his contemporaries as could best judge of his conduct and character, evidently regarded him as a man of sincere piety.

Nor was the genius of Buchanan less variegated than his life. In his numerous writings he discovers a vigorous and mature combination of talents, which have seldom been found united in equal perfection. To an imagination excursive and brilliant, he unites an undeviating rectitude of judgment. His learning was at once elegant, various, and profound: Turnebus, who was associated with him in the same college, and whose opinion is entitled to the greatest deference, has characterized him as a man of consummate erudition. Most of the ancient writers had limited their aspiring hopes to one department of literature; and even to excel in one, demands the happy perseverance of cultivated genius. Plato despaired of securing a reputation by his poetry; the poetical at-

they are commonly represented, would not have been suf-Buchanan. ficient to transmit an illustrious name to future ages. Buchanan has not only attained to excellence in each species of composition, but in each species has displayed a variety of excellence: in philosophical dialogue and historical narrative, in lyric and didactic poetry, in elegy, epigram, and satire, he has scarcely been surpassed either in ancient or modern times. A few Roman poets of the purest age have excelled him in their several provinces; but none of them has evinced the same capability of universal attainment. Horace and Livy wrote in the language which they had learned from their mothers; but its acquisition was to Buchanan the result of much youthful labour. Yet he writes with the purity, the elegance, and freedom of an ancient Roman. Unfettered by the classical restraints which shrivel the powers of an ordinary mind, he expatiates with all the characteristic energy of strong and original sentiment; he produces new combinations of fancy, and invests them with language equally polished and appropriate. His diction uniformly displays a happy vein of elegant and masculine simplicity, and is distinguished by that propriety and perspicuity which can only be attained by a man perfectly master of his own ideas, and of the language in which he writes. The variety of his poetical measures is immense, and to each species he imparts its peculiar grace and harmony. The style of his prose exhibits correspondent beauties, nor is it chequered by phraseology unsuitable in that mode of composition. His diction, whether in prose or verse, is not a tissue of centos; he imitates the ancients as the ancients imitated each other. No Latin poet of modern times has united the same originality and elegance; no historian has so completely imbibed the spirit of antiquity, without being betrayed into servile and pedantic imitation. But his works may legitimately claim a higher order of merit; they have added no inconsiderable influx to the general stream of human knowledge. The wit, the pungency, the vehemence, of his ecclesiastical satires, must have tended to foment the genial flame of reformation; and his political speculations are evidently those of a man who had nobly soared beyond the narrow limits of his age.

Of the works of Buchanan there are two collective edi tions, the earlier of which was published by Ruddiman Edinb. 1715, 2 tom. fol. The editor's masterly acquaintance with philology, and with the history of his native country, had eminently qualified him for such an undertaking. The accuracy of the text, and the utility of his illustrations, are equally conspicuous. He has prefixed a copious and satisfactory preface, and, among other appendages, has added a curious and critical dissertation De Metris Buchananæis. His annotations on Buchanan's history are particularly elaborate and valuable; but it is to be lamented that his narrow politics should so frequently have diverted him from the more useful tracts of enquiry. Where political prejudices intervene, he is too eager to contradict his author; and he often attempts, by very slender and incompetent proofs, to extenuate the authenticity of his narrative. In illustrating the moral and literary character of Buchanan, he spent many years of his life. With great zeal and success, he afterwards vindicated his paraphrase of the Psalms against the objections of Benson; but his political prejudices seem to have increased with the number of his years. His controversies with Love and Man were conducted with sufficient pertinacity; though it must be acknowledged that the advantage of learning, and even of candour, generally inclines to Ruddiman's side. Another edition of Buchanan's works was published by Burman, a most indefatigable and useful tempts of Cicero though less contemptible perhaps than labourer in the department of philology, and a man of

Buckie

hamshire.

Bucke-

Bucharest much more taste and talent than some of our readers may perhaps be inclined to suppose. Lugd. Bat. 1725, 2 tom. 4to. He has reprinted his predecessor's notes, dissertation, and other appendages, and has himself interspersed some critical annotations.

BUCHAREST, BUKHOREST or BUKOREST, the capital of Wallachia, and residence of the waiwode of that province, is situated on the Dumbovicza, a tributary of the Danube, in Lat. 44. 26. N. Long. 26. 8. E., at the distance of about 300 miles from Constantinople. Like the majority of Turkish towns, Bucharest, when seen at a distance, presents a very picturesque appearance, from the number of its gilded cupolas and minarets. On a closer inspection, however, the charm is dissolved. The houses are for the most part little better than huts; the streets, where paved at all, are paved with wood, and are thence called ponti (bridges); sewerage is a thing unknown; and the filth accumulating in vast quantities from year to year generates fevers and the plague. The public buildings, when closely examined, are mean and poor; the palace of the hospodar is a low wooden edifice in the centre of the great square, in which also the metropolitan church is situated. The only buildings that make any pretensions to elegance and comfort are the inns, some of which are magnificent. These, like all the houses in Bucharest, are situated in the midst of large gardens. It is computed that there are in the city 95 churches and upwards of 20 monasteries. It also contains a poorhouse, and several hospitals, one of which, reserved for soldiers, is admirably conducted by German physicians. There is likewise a wooden theatre, where French and Italian operas are sometimes performed. The number of schools is about 70 in all, attended by nearly 1800 pupils: the college, connected with which is a museum containing a public library, annually musters about 500 students. Instruction is communicated at this establishment in the French tongue, though modern Greek and Italian are the languages spoken by the Frank population. The number of carriages in Bucharest is very great, and was estimated by Clarke the traveller in his day at about 4000. The manners of the inhabitants are extremely profligate; gambling, and many other worse forms of vice, are universally practised. As Bucharest is situated in the midst of an extremely fertile district, it has a considerable export trade. Corn, wool, hides, tallow, and honey are transmitted in large quantities to Odessa and Constantinople, while vast herds of swine and cattle are driven into Germany, and sold there. A considerable number of German jewellers have established themselves in Bucharest. The annual tribute which the city pays to its Turkish masters is about L.26,000. Pop. about 65,000.

BUCHOLZ, CHRISTOPH FRIEDRICH, a distinguished German chemist, born at Eisleben in 1770. In his nineteenth year he was appointed to superintend a manufactory at Ochsenfurt in Franconia; from which town at the end of two years he removed to Mulhausen, where he conducted the experiments by which he first became known. In 1808 he graduated as a physician at Rinteln, and in the following year at the university of Erfurt. In 1813 his health gave way from the long imprisonment which he suffered, consequent upon the siege of that town. He then removed to Aix-la-Chapelle, where his eyesight became affected; and when he retired finally to his birth-place, he was nearly blind. He died in 1818. His works are very multifarious, and, besides numerous separate treatises, comprise translations from the English, and contributions to the principal scientific journals of his native country.

BUCK, the male of the fallow deer, the goat, rabbit, &c. BUCKEBURG, a city, the capital of the dominions of the prince of Schaumburg-Lippe. It is pleasantly situated

on the side of a hill, at the foot of which runs the river Aue, about six miles from Minden. It has a castle surrounded by a park, a gymnasium, orphan asylum, and 4000 inhabitants. Long. 9. 3. E. Lat. 52. 15. 47. N.

BUCKIE, a fishing village of Scotland in the county of Banff, 5 miles N.N.W. of Cullen, famous for its haddocks.

Pop. (1851) 2789.

BUCKINGHAM, the chief town of Buckinghamshire, a parliamentary and municipal borough and market-town in the hundred of the same name, 58 miles from London. is situated on the left bank of the river Ouse, which surrounds it on every side but the north, and is crossed by two bridges. The town consists principally of one long street, straggling irregularly over a considerable extent of surface. The houses, which are chiefly brick, are neat and clean, though somewhat humble in character. The only public buildings of importance are the town-hall, which is built of brick, and the church, which is built of freestone, and has a handsome spire 150 feet high. The town is one of great antiquity, and enjoyed various privileges under different English sovereigns. It was the headquarters of Charles I. for a few days during his wars with the parliament. In 1725 a third of the town was burnt to the ground. Besides the church already alluded to, there are two places of worship for Independents, and one for Baptists in the town. An endowed free school for boys, who were clad in green coats, by the will of the founder, Gabriel Newton, is now incorporated with the national school, which is intended to accommodate 300 pupils. The grammar-school of the town was founded by Edward VI. There are no manufactures of any consequence. An attempt was unsuccessfully made to introduce straw-plaiting; but lace-making with bobbins still occupies a small part of the female population. There are some corn and paper mills in the neighbourhood, and a few lime quarries. The borough of Buckingham returns two members to parliament, and is governed by a mayor, four aldermen, and twelve councillors. The revenue of the corporation is between L.700 and L.800 annually. The living, which is in the gift of the Duke of Buckingham, is a vicarage of L.230 value in the diocese of Oxford. Pop. (in 1851) of parliamentary borough 8069; of municipal borough 4020.

BUCKINGHAM, George Villiers, Duke of. See VILLIERS. BUCKINGHAM, John Sheffield, Duke of. See SHEF-

BUCKINGHAMSHIRE, or Bucks, an inland county of England, lying between 51.25. and 52.10. N. Lat. and 0.28. and 1.12. W. Long., is bounded on the N. and N.W. by Northamptonshire, west by Oxfordshire, south by Berkshire, and east by Bedfordshire, Hertfordshire, and Middlesex. It is the thirty-third in size of the English counties, measuring 53 miles at its greatest length and 27 at its greatest breadth, and containing, according to the last ordnance survey, 472,320 acres, or 738 square miles. aspect of the country is agreeably diversified by the distribution of forests, rivers, hills, pasture, and arable land. In the southern portion of the county the forests, consisting chiefly of beeches (from the Saxon name of which, buccen, the county is said to derive its name), were at one time very extensive, but these have of late years been greatly thinned: woods of considerable extent are still to be found in the northern parts. The principal rivers of Buckinghamshire are the Thames, which separates it from Berkshire and Surrey, and receives as tributaries the Colne and the Thame; and the Ouse, with its tributary the Ousel, which belongs to the north of the county. The only hills in Bucks worth mentioning are the Chilterns, which cross it in a north-westerly direction, and rise at two or three points to the height of about 900 feet. Of the roads which pass

Bucking- through the county the most important are, that which connects London with Chester and Holyhead, by which the mails were forwarded to Ireland before the introduction of railways; the great western road connecting the metropolis with Bath and Bristol; and the roads to Oxford and Birmingham. The only canal of any importance is the Grand Junction, from which branches proceed to several of the larger towns. The North-Western railway passes through the east of the county, and a branch line from it terminates at Aylesbury. Another branch intersects the north-western district, and after passing Winslow, divides into two branches, one of which terminates at Banbury and the other at Oxford. The Great Western railway passes through the south. A branch to Windsor quits the trunk line at Slough.

The agricultural capacities of Bucks vary considerably in different parts of its extent. The Vale of Aylesbury, lying between hills on either side, is one of the most fertile and valuable districts in England, and is divided in nearly equal proportions between pasture and tillage. Towards the north of the county, however, the soil greatly degenerates, and sometimes does little more than pay the expenses incurred in its cultivation. These natural defects are enhanced by the extremely backward condition of agriculture in many of the more remote districts. In the north and west of the county, the rent of land ranged in 1850 from ten shillings an acre for the lowest quality of undrained lands under tillage, to fifty shillings for prime old grazing lands. In the southern and eastern districts, which lie chiefly upon clay, the rent varied from fifteen to thirty shillings an acre. The farms are not generally large. The largest do not exceed 500 acres, while there are many of not more than 20 or 30 acres. The average size is about 180 or 200 acres. Leases are sometimes though not generally given, and never for more than 14 years. The quantities of cattle reared and fed in Bucks are very considerable. The number of milk cows is estimated at upwards of 20,000, yielding on an average about 4,000,000 lb. of butter, which is rapidly despatched to London by rail, where it finds a ready market. breeds of oxen are found serviceable, partly for ploughing the soil and partly to be fattened for the London market. Hogs are extensively reared on many farms, and are found to be a source of considerable profit to the farmer. In many parts of the county, especially at Aylesbury, great numbers of ducks are fattened and sold in the early London

Bucks was originally divided into eighteen hundreds: it is now divided into eight. These are Newport, Buckingham, Ashendon, Cottlesloe, Aylesbury, Burnham, Stoke, and Desborough, the last three forming what is well known as "The Chiltern Hundreds." That of Aylesbury, still retains its ancient designation of the "three hundreds of Aylesbury." The number of parishes in the entire county is computed at 202. The market-towns are Amersham. Aylesbury (in all respects the most important town in the county, though Buckingham is the capital), Beaconsfield, Buckingham, Chesham, Great Marlowe, High Wycombe, Ivinghoe, Newport-Pagnell, Olney, Prince's Risborough, S ony Stratford, Wendover, and Winslow. There are many other interesting, though not very important places in Buckinghamshire, of which we may mention Chalfont-Saint Giles—the residence for a time of the poet Milton, and where he completed the Paradise Lost, and began the Paradise Regained; Hampden, the manor-house of which was for many generations the abode of the family of that name, and in the churchyard of which the patriot (who fell at Chalgrave in 1643) is buried; Medmenham, in the old abbey of which a celebrated club of "Franciscans," of which John Wilkes, Bubb Doddington, and other political notorieties of last century were members, held their convivial meetings; Pitstone, in the abbey of which Queen

Elizabeth used frequently to reside in her younger days; Buckler, Stoke Pogeis, celebrated by Grey in his Elegy and Long Story; Slough, for many years the residence of Sir William Herschel, and the place where his great telescope was constructed; not far from Slough Salthill, where the Eton-Montem, recently abolished, used to be held; Olney, familiar to all the readers of Cowper, near which is Weston Underwood, for some years the residence of that poet; and Butler's Court or Gregories, the seat of Edmund Burke. The principal seats in Buckinghamshire, are Stowe, once the residence of the dukes of Buckingham, and celebrated for its grounds, and its collections of pictures and statues, which were sold a few years ago; Bulstrode, once a seat of the dukes of Portland, now the property of the Duke of Somerset; Wootton House, belonging to the Marquis of Chandos; Hampden House to the Earl of Buckinghamshire; Penn House to Earl Howe; Eythorpe to the Earl of Chesterfield; Ashridge to Lord Ellesmere; Dropmore to Lady Grenville; Ashton Clinton to Lord Lake; Morton House to Lord Godolphin; Dilton Park to Lord Montague; Lillies to Lord Nugent. Bucks is in the Norfolk circuit. The quarter-sessions are always held at Aylesbury: the assizes used to be held alternately at that town and Buckingham, but are now held only at Aylesbury. Before the passing of the Reform bill, Bucks returned in all fourteen members to the House of Commons. It now returns eleven, three of whom represent the county and eight the parliamentary boroughs. The result of the county elections is always announced at Aylesbury. Bucks is governed by a lord-lieutenant and custos, 60 deputy-lieutenants, a high sheriff, and about 200 magistrates. It lies in the ecclesiastical province of Canterbury, in the diocese of Oxford, and arch-deaconry of Buckingham, which comprises the deaneries of Bucks, Burnham, Muresley, Newport, Waddesden, Wendover, and Wycombe, in all about 180 benefices. The total number of places of worship in Bucks is 499, of which 266 belong to the Church of England; 56 to the Independents; 72 to the Baptists; 8 to the Society of Friends; 120 to the Wesleyan Methodists; 12 to isolated congregations; 4 to the Roman Catholics; and 1 to the Latter-Day Saints. The entire population of the county in 1851 was 163,554, of whom 80,990 were males, and 82,564 females. The parliamentary boroughs returning each two members to parliament are Aylesbury, pop. 26,794; Buckingham, pop. 8069; Chipping Wycombe, pop. 7179; Great Marlow, pop. 6523. The towns of more than 2000 inhabitants, not corporate towns, nor included in any parliamentary borough, are Amersham, pop. 2093; Chesham, pop. 2496; Newport-Pagnell, pop. 3312. The manufactures of Buckinghamshire are neither very extensive nor very important. The principal are those of lace and straw-plait. The number of persons chiefly engaged in agriculture is about 14 per cent.; in trade and manufactures about 12 per cent. The number of inhabited houses in the county is 33,160; uninhabited, 1206; building, 98.

BUCKLER, a piece of defensive armour, worn on the left arm, and composed of wickers woven together, or wood of the lightest sort, covered with hides, and fortified with plates of brass or other metal. Its figure was round, oval, or almost square. Bucklers were sometimes curiously adorned with figures of birds and beasts, and of the gods, the celestial bodies, and other natural objects; a custom which was derived from the heroic times, and from them communicated to the Grecians, Romans, and barbarians. The scutum, or Roman buckler, was composed of wood or wicker-work, and covered with a bull's hide. In the middle was an iron boss, or a spike, which was sometimes used to press violently upon the enemy. The Greek clipeus was smaller than the scutum, and quite circular. This species of shield belonged properly to other nations, though for some little time it was used by the Romans. Scuta were Buda.

Bucklers of two kinds, the ovata and the imbricata; the former of a plain oval figure; the latter oblong, and shaped like half a cylinder. Polybius (vi. 21) makes the scuta 4 feet by  $2\frac{1}{2}$ , while Plutarch calls them ποδυρεις, reaching down to the feet; and it is probable that they covered almost the whole body, since in Livy soldiers on guard are mentioned as sometimes sleeping with their heads on their shields, while the other extremity of the shield rested on the ground.

> Bucklers, Votive, those consecrated to the gods, and hung up in their temples, in commemoration of some hero, or as a thanksgiving for a victory over an enemy, whose

bucklers, taken in war, were offered as trophies.

BUCKRAM, a sort of coarse linen or cotton cloth stiffened with glue or paste, and used chiefly in the making of women's garments, to keep them in the form intended.

BUCKWHEAT. See AGRICULTURE.

BUCOLIC, (βουκόλος a herdsman, βουκολικός pastoral), in ancient poetry, a kind of poem relating to shepherds and rural affairs. According to the generally received opinion, it was of Sicilian origin. "Bucolics," says Vossius, "have some conformity with comedy. Like it, they are pictures and imitations of ordinary life; with this difference, however, that comedy represents the manners of the inhabitants of cities, and bucolics the occupations of country people." "Sometimes," he continues, "this last kind of poem is in the form of a monologue, and sometimes in that of a dialogue. Sometimes there is action in it, sometimes only narration, and sometimes it is composed both of action and narration." The hexameter verse is the most proper for bucolics in the Greek and Latin tongues. Moschus, Bion, Theocritus, and Virgil, are the most renowned of the ancient bucolic poets.

BUCOVAR, a small circle in the Austrian kingdom of Hungary, surrounding the city of the same name, and extending over two hundred and sixty-six square miles or 170,240 acres. The city stands at the junction of the Buka with the Danube. It contains one Catholic and two Greek churches, seven hundred houses, and 6300 inhabitants, chiefly employed in the cultivation of vines, the rearing of silk-worms, and the spinning of silk. Long. 18. 55. 20. E.

Lat. 45. 21. 9. N.

BUDA, or OFEN, a free city, the capital of the Austrian kingdom of Hungary, on the right bank of the Danube, opposite Pesth, with which it is connected by a bridge of boats, and by a beautiful iron suspension bridge, 1227 feet long and 39 feet wide, opened in 1849. It is the residence of the palatines, and the seat of the boards of the several departments of government and of ecclesiastical affairs. The public buildings worthy of notice are the castle (in which the crown and regalia of Hungary were kept till the last revolution, after which they were removed to Vienna) the townhouse, cathedral, observatory, the orphan asylum, and a number of churches. There are also a gymnasium and several libraries. Pop. 32,000, principally employed in the manufacture of leather, cutlery, silk and woollen goods, and in the cultivation of the vineyards in the vicinity, which yield an excellent red wine. Long. 19. 3. 18. E. Lat. 47. 29. 14. N. The town has been long celebrated for its mineral baths, supplied from the hot sulphureous springs in the neighbourhood. These baths were highly appreciated in the time of the Romans and also by the Turks. Of those constructed by the Romans only a few fragments now remain; but of the Turkish, three remain to this day in so perfect a state as still to be used. The temperature of the water is about 118 Fahr. Buda was in the possession of the Romans till towards the end of the 4th century. About 900, Arpad the Magyar chief, made it his capital, and subsequent monarchs greatly enlarged and improved it. In 1526 it was taken by Solyman the Magnificent, but retaken by Ferdinand I. king of Bohemia, in the following year. It was again captured by Solyman in 1529, and held by the Turks till 1686, when it was recovered by the Austrians under the Prince of Lorraine the Ganesha Upa-Purana, in which the appearance of

after a desperate resistance. In 1849, it was taken by the Budæus

Hungarian army, but soon after abandoned.

Buddha.

BUDÆUS, or BUDÉ, GUILLAUME, descended of an ancient and illustrious family, was born at Paris in 1467. At an early age he was sent to the schools of Paris, which, however, were at that time so ill-managed, that Budæus took a dislike to them, and spent his whole time in idleness, till his parents sent him to the university of Orleans to study law. There he passed three years without adding to his knowledge; so that his parents, on recalling him to Paris, found his ignorance as great as before, and his aversion for study, and love of gaming and pleasure, much greater. Being heir to a large fortune, he was left to follow his own inclinations. He was passionately fond of hunting, and devoted himself to his horses, dogs, and hawks. But when the fire of youth began to cool, he was seized with an irresistible passion for study, and having disposed of his hunting equipage, abandoned business of every description, and applied wholly to literature. Without any assistance, he made a rapid progress, particularly in the Latin and Greek languages. The work which gained him greatest reputation was his treatise De Asse, the first edition of which was published at Paris in 1514, in folio. To the advantages of erudition and high birth he united piety, modesty, gentleness, and goodbreeding. He was greatly esteemed by the French king, Francis I., who often sent for him, and, at his persuasion, and that of Du Bellay, founded the royal college of France, for teaching the languages and sciences. He was sent by the king to Rome in the character of ambassador to Leo X., and in 1552 was made master of requests. The same year he was chosen provost of the merchants. He died at Paris in 1540. His works, extending to four volumes in folio, were printed at Basle in 1557.

BUDDÆUS, JOHN FRANCIS, a celebrated Lutheran divine, and one of the most learned men Germany has produced, was born in 1667, at Anclam, a town of Pomerania, where his father was minister. He studied with great dis tinction at Greifswalde and at Wittenberg; and having attained to eminence in languages, theology, and history, was appointed Greek and Latin professor at Colberg; afterwards professor of ethical science and politics in the university of Halle; and at length, in 1705, professor of divinity at Jena, where, after having acquired a very great

reputation, he died in 1729.

His principal works are,—A large historical German Dictionary, Leipzig, 1709, folio; Historia Ecclesiastica Veteris Testamenti, Halle, 1709, 4 vols. 4to; Elementa Philosophiæ Practica, instrumentalis et theoretica, 3 vols. 8vo, which has passed through a great number of editions; Selecta Juris Natura et Gentium, Halle, 1704, 8vo; Miscellanea Sacra, Jena, 1727, 3 vols. 4to; Isagoge Historico-Theologica ad Theologiam Universam, singulasque ejus partes, 2 vols. 4to, a work much valued by the Lutherans; and a Treatise on Atheism and Superstition.

BUDDHA, or Buddhu, one of the two appearances of Vishnu, assumed for the purpose of deluding the enemies of the gods, and effecting their destruction by leading them to profess heretical opinions, and thus to reject the Hindu religion. In the Bhagawat, a work held in high esteem by the great majority of the Hindus, it is expressly declared, "that, at the commencement of the Kali Yug, Vishnu became incarnate in Kikata, under the name of Buddha, the son of Jina, for the purpose of deluding the enemies of the gods;" that "the Undiscernible Being, having assumed a mortal form, preached heretical doctrines in the three cities founded by Maya, for the purpose of destroying, by deluding, the enemies of the gods, stedfast in the religion prescribed by the Vedas;" that praise is due to "the pure Buddha, the deluder of the Daityas and Danawas;" and that, "by his words, as Buddha, Vishnu deludes the heretics." The same legend is related in a more detailed manner in the Kashi Khand of the Skanda Purana, and also in Buddha. Buddha is described as a manifestation rather than an incarnation of Vishnu; and an account is given of the circumstances under which it is alleged to have been made. According to the Puranas, Divodasa, a king of the solar race, finding Kashi unoccupied, took possession of the place, and there established the religion of Vishnu on so firm a foundation, and rendered his people so virtuous and happy, that the gods having become alarmed lest they should lose their supremacy, which they maintained by the use of very different means, applied to Vishnu and Shiva to relieve them from their anxieties on this head. The two incarnations of the Supreme Being, however, declared at first that it would be unjust to deprive so virtuous a prince of his kingdom; but Divodasa, having obtained as a boon from Brahma that none of the deities should remain in his kingdom, or exercise any power over it, Shiva at length waxed wroth at being so long banished from his favourite residence, and consented to fulfil the malignant wishes of the deities. But how was this to be accomplished? As long as Divodasa and his subjects remained stedfast in their religion, they were secure from injury; it therefore became necessary to lead them into error as a pretext for destroying them; and with this view Devi, the twelve suns, and Ganesha, were employed, but without success. At last, when these minor tempters had failed, Vishnu appeared, as Buddha, and effected their apostasy.

From the tenor of this legend may be divined, a priori, the doctrines which it was necessary for Buddha to propagate, in order to induce Divodasa and his subjects to apostatize from the religion of the Vedas. These in fact were, -that no credit whatever is due to the Vedas or Shastras; that it is vain to worship the images of gods; that sacrifices are cruel and sinful; that there is no such thing as transmigration of souls; that at death the five elements in the body dissolve never to reunite; that pleasure is the grand object of life, and that all acts of abstinence, piety, and charity, are unprofitable; that the body is man's real god, and should alone be worshipped; that pleasant food, fine clothes, and handsome women, form the grand felicity of man; that this world is without beginning, and consequently owes its existence neither to creator nor cause; and that Brahma, Vishnu, Shiva, Budra, and all the other gods, are mere creatures of fancy and fear, and never had a being, except in the imaginations of their worshippers. In short, the ancient Brahminical Buddha, whether a manifestation of Vishnu according to the Shaivas, or an incarnation according to the Vaishnavas, was the propagator of a system of universal scepticism, embracing not only a disbelief of all religion, but also a disregard for all virtue, and indeed for everything except mere sensual gratification. He was a false teacher and impostor, who came to deceive and to mislead, in order to destroy; not a kind and merciful being, adorned with the attributes of wisdom and benevolence, and worthy to receive all praise and worship, as some have erroneously supposed. Moreover, his appearance was for a temporary and local purpose, namely, to render Divodasa the voluntary cause of his own downfal, and thus to gratify the malice of the deities who had conceived an aversion to that virtuous potentate. But the sceptical doctrines which he disseminated in the course of his delusive manifestation became afterwards blended and intermixed with a variety of others of a totally different description; so that, although Buddhism has ever continued more or less distinct from the faith of which originally it formed the negation, it is exceedingly difficult to trace its progress, and by no means easy to ascertain its precise character at any given period of time. The rejection of the Vedas, and of the religion founded upon them, seems, however, to be common to all forms of Buddhism; and although the Brahmins nevertheless recognise Buddha as an object of worship or reverence, it is only as a manifestation of Vishnu, one of the emanations of Brahm, or the Supreme

Being, and not as a false teacher and an impostor, whose ob- bugons. ject was to deceive and delude, that he is acknowledged by the sacred caste of the Hindus. By not perceiving or not attending to this distinction, all the writers on the subject whose works we have consulted have entangled themselves in the mazes of inextricable perplexity and contradiction, and thickened the darkness which they laboured to dispel. M. Guigniaut, indeed, has attempted to cut the knot which he could not unloose. "Bouddha ne jouit d'aucun culte dans l'Inde," says he; "ses temples, ses idoles y sont renversés ou abandonnés; une ténébreuse horreur, une ignorance feinte ou réelle, une haine non moins violente qu'irréfléchie, regnent chez les Brahmanes, sur tout ce qui concerne sa doctrine." But in another part of his work (Religions de l'Antiquité, vol. i. p. 294), the same author admits that Buddha has not ceased to be revered by the Hindu nation; an admission wholly irreconcilable with the statement contained in the passage just quoted. This confusion of ideas, however, proceeds from incorrect notions as to the character of Buddha; for as long as he is considered merely as a manifestation of Vishnu, he is held to be an object of reverence, not as Buddha, but as the divinity who chose to appear in that form. The Hindus have never acknowledged him in any other character; and consequently all that has been written concerning him with reference to the religion of India, is wholly irrelevant, and foreign to the subject.

According to the fable, Buddha, when he had effected the apostasy of Divodasa, was prevailed upon by the Brahmins and holy men to terminate the propagation of heretical doctrines, upon which he disappeared in a deep well at Gaya, leaving neither writings nor disciples behind him; and it is further believed, upon the credit of tradition, that no Buddhists were known in India, until their sect was established by Gautama or Godama, with whom Buddha is frequently confounded. Now, in this mythic account, which is supported by a legend in the Shiva Purana, we have the true genius of Buddhism displayed. Its character throughout is essentially negative. When reduced to its elements or first principles, it consists merely of the rejection of the Vedas and of the religion founded upon them. It is not the Hindu faith; but under this denomination of Buddhism there may be, and in point of fact there has been, included the most various, not to say incongruous, tenets and superstitions which it is possible to imagine; and although its negative character is everywhere the same, its positive character differs in different countries. Hence the Buddhism of China, allied to the institutions, laws, and maxims of Fo and Confucius, is in many respects as different from the Buddhism of the Burman empire as the latter is from the system of religion founded on the Vedas and the Shastras. But. nevertheless, it has some positive general characteristics. The principles of this sect, as established by Gautama, its founder, about five hundred years before Christ, are unknown; but those now ascribed to him, and professed as his alleged revelations, may be very briefly stated. The doctrine and law of Gautama consists chiefly in observing five commandments, and abstaining from ten sins. The five commandments contain prohibitions against killing any animal whatsoever, from the meanest insect up to man; against the commission of theft; against the violation of another man's wife or concubine; against falsehood; and against the use of wine, or any intoxicating liquor or drug, as opium; and an exemption from poverty, misfortune, and calamity is promised to those who keep these commandments during all successive transmigrations. The ten sins consist in the killing of animals, theft, adultery, falsehood, discord, contumelious language, idle and superfluous talk, covetousness, envy or malice, and the following of false gods: and he who abstains from all these sins is said to obtain Sila, while every one who observes Sila, in all successive transmigrations, becomes at last worthy of beholding a god, and of hearing his

Budget

Buägell.

Bude-Light great voice, and is exempted from the four known miseries, namely, weight, old age, disease, and death. There are also certain positive good works which ought to be practised, such as Dana, which consists in giving alms, and Bavana, which consists in repeating solemnly the three words Aneizza, Docha, and Anatta; the first indicating liability to vicissitude, the second exposure to misfortune, and the third the impossibility of obtaining exemption from these evils. From this statement it appears that the two scales of commandments and prohibitions are singularly ill adjusted to each other; inasmuch as the duties enjoined are only half the number of the sins forbidden, and as the regative and

the positive in morals are blended in both.

The worshippers of Buddha contend with the disciples of Brahma for the honour of a high antiquity; and this pretension has been countenanced by some European writers of high reputation. Sir William Jones, for instance, fixes the first appearance of Buddhism about a thousand years before Christ; but his argument rests upon very weak grounds, and, if the Puranas are admitted to be of any authority, it is wholly untenable; for whatever antiquity may be ascribed to Buddha, considered as a manifestation of Vishnu for the purpose of local and temporary delusion, there are clearly no grounds, mythological, traditional, or historical, for placing the origin of this sect higher than the period of Gautama, or about five hundred years before Christ, as already mentioned. What we know with certainty is, that Buddhism, so called doubtless from its peculiar character, once predominated throughout a great part of India; that the doctrines and system of belief adopted by its votaries were in direct opposition to the religion founded on the Vedas; that a deadly hatred arose between the followers of Brahma and the Buddhists, which ended in the expulsion of the latter; that, nevertheless, the Brahmins continued to reverence Buddha as the manifestation of Vishnu, however much they might have detested the sect which called itself by his name; that Buddhism appears to have diffused itself over all the countries from Bengal to China inclusive; that in its character and genius it is extremely flexible and accommodating; and that, in the different countries which it overspread, it appears to have become amalgamated with indigenous local superstitions of almost every description. (See Kennedy's Researches into the Nature and Affinity of Ancient and Hindu Mythology, p. 248, et seq.; Transactions of the Bombay Literary Society, part iii. p. 532; Guigniaut, Religions de l'Antiquité, tom.i. p. 300; Heeren, Ideen über die Politik, &c. vol. viii. p. 127, 4th edit.; Asiatic Researches, vol. viii. p. 474; Hardy, Eastern Monachism; Hardy, Manual of Buddhism.)

BUDE-LIGHT, an ingenious contrivance for increasing the brillancy of any sort of lamp or gas-flame, by introducing a current of pure air, so as to carry off the product of combustion. It is the invention of Mr G. Gurney; and is named from his Cornish residence, where it was first tried.

BUDGELL, EUSTACE, an ingenious writer, was the son of Gilbert Budgell, D.D., and was born at St Thomas, near Exeter, in 1685. He was educated at Christ Church, Oxford, from which he removed to the Inner Temple, London; but instead of studying the law, he devoted his whole attention to polite literature. He contracted a friendship with Addison, who was first cousin to his mother, and who, on being appointed secretary to Lord Wharton, lord-lieutenant of Ireland, took Budgell with him as one of the clerks of his office. Budgell, who was then about twenty years of age, and had read the classics and the works of the best English, French, and Italian authors, now united with Sir Richard Steele and Addison in writing the Tatler. He soon afterwards contributed to the Spectator, where all his papers are marked with an X. To the Guardian, also, he contributed those papers which are marked with an asterisk. He was subsequently made under-secretary to Addison, chief

secretary to the lords justices of Ireland, deputy clerk of the council, and soon afterwards was chosen a member of the Irish parliament. In 1717, when Addison became principal secretary of state in England, he procured for Budgell the place of accountant and comptroller-general of the revenue in Ireland. But the next year, the Duke of Bolton being appointed lord-lieutenant, Budgell wrote a lampoon against Mr Webster, his secretary, in which his Grace himself was not spared. This indiscretion became the primary cause of his ruin; for the Duke of Bolton, in support of his secretary, got Budgell removed from his post of accountantgeneral; upon which he returned to England, and, contrary to the advice of Addison, published his case in a pamphlet. In the year 1720 he lost L.20,000 by the South Sea scheme, and afterwards spent L.5000 more in unsuccessful attempts to get into parliament. This completed his ruin. He at length employed himself in writing pamphlets against the ministry, and published many papers in the Craftsman. In 1733 he began a weekly periodical called the Bee, which he continued for above a hundred numbers, and which is printed in eight volumes 8vo. During the progress of this work occurred the death of Dr Tindal, by whose will Budgell received a legacy of L.2000; and the world being surprised at such a gift from a man entirely unrelated to him, to the exclusion of the next heir, a nephew, and the continuator of Rapin's history of England, immediately imputed it to his having made the will himself. Hence the satirist:

> Let Budgell charge low Grub-street on my quill, And write whate'er he please except my will.

It was thought that he had some hand in publishing Dr Tindal's Christianity as old as the Creation; for he often talked of an additional volume on the subject, but never published it. After the cessation of the Bee, he became so involved in lawsuits that he was reduced to very distressing straits. He was called to the bar, and attended for some time in the courts of law; but being unable to make any progress, and finding his prospects utterly ruined, he determined to put an end to his life. Accordingly, in 1736, he took a boat at Somerset-stairs, after filling his pockets with stones; ordered the waterman to shoot the bridge; and while the boat was passing under it he threw himself into the river. On his bureau was found a slip of paper with these words:

> What Cato did, and Addison approved, Cannot be wrong.

Besides the above works, he wrote a Translation of the Characters of Theophrastus. He never married, but left one natural daughter, who afterwards assumed his name, and became an actress at Drury-lane.

BUDGET, a bag or little sack. This word is used to designate the statement respecting the financial position of the British nation, which the chancellor of the exchequer lays before the House of Commons at the commencement

of each session of parliament.

BUDNÆANS, in *Ecclesiastical History*, so called from their leader, Simon Budnæus, or Budny. They not only denied all kind of religious worship to Jesus Christ, but asserted that he was not conceived by virtue of any divine power. Budnæus was deposed from his ministerial office in 1584, and with his adherents publicly excommunicated; but afterwards renouncing this opinion, he was restored to the communion of the Socinian sect. Crellius ascribes the origin of the above opinion to Adam Neuser.

BUDUN, a Ceylonese deity, supposed to have arrived at supremacy after successive transmigrations from the lowest state of an insect through the various species of animals There have been three successive deities of this name.

BUDWEIS, the capital of a circle of the same name in the Austrian kingdom of Bohemia, is situated on the river Moldau, 75 miles south of Prague. It is an ancient town, well built, and partially fortified. The council house is a

Ayres.

Buenaire handsome building, having in the centre of its large square a fine fountain. It has a cathedral, and several other churches, a gymnasium, philosophical academy, a high and other schools, and manufactures of woollen cloth, muslin, damask, saltpetre, and musical instruments. It is connected by railway with Linz and Gmünden. Pop. 8000.

BUENAIRE, one of the Dutch West India Islands, lying 30 miles east of Curaçoa. It is 50 miles in circumference, is mountainous in its appearance, and has about 2000 inhabitants. It produces only a few cattle, some goats, large quantities of poultry, and of late years a considerable quantity of salt. On the S.W. side there is a good

harbour. Long. 68. 15. W. Lat. 12. 12. N.

BUENOS-ÄYRES, the largest and most important province of the Argentine Confederation, is bounded on the north by the Parana, which separates it from the province of Entre Rios; and by the provinces of Santa Fé, San Luis, and Mendoza; on the east by the Atlantic; on the south by the Rio Negro, which separates it from Patagonia; and on the west by the country of the Indians, which extends west-wards to the Andes. The area of the province is estimated by Sir Woodbine Parish at about 200,000 square miles, being little less than that of France. Its seaboard along the Rio de la Plata and the ocean is upwards of 600 miles in length. Since 1825 no census of the population has been taken. At that date it was found to amount to 183,000. Parish estimates the present population at 320,000, of which number 120,000 belong to the city of Buenos-Ayres. By M'Cann, another authority, the entire population of the province is computed at 200,000. This small increase over the results of the census of 1825 is attributed by him to the civil wars, to the prohibition of the slave-trade, and other causes.

The general aspect of the country, as viewed from the sea, is eminently uninteresting. From the mouth of the Plata to the Bahia Blanca the sea-line presents an unbroken series of sand-dunes, varied here and there with low ridges of rock. From this latter point to the Patagonian frontier the aspect of the coast is less monotonous, though equally destitute of life or interest. Though Buenos-Ayres is the only province of the Argentine Confederation that borders upon the sea, and though all the exports and imports of the country pass through it, it possesses only two harbours, one of which (that of the city Buenos-Ayres) is extremely bad; the other (that of Belgrano, near the southern extremity of the province), though possessing great natural advantages, is by no means adequately appreciated. It might be turned to good account as a starting point for vessels engaged in trade with the South American states that border upon the Pacific, but the difficult and sometimes dangerous navigation of the adjoining seas counterbalances in the meantime the other advantages which it offers. The interior of the country, except where it is intersected by the low mountain ranges of the Ventana and Vaulcan in its southern portions, and the spurs of the Andes in the west, is one vast plain, of which by far the larger part is laid out in estancias, or cattle farms, though the soil is in itself well adapted for producing all the European cerealia. Agricultural pursuits, however, are by no means in favour with the natives, who cannot bring themselves to engage in any pursuit that cannot be prosecuted on horseback. "Every man, woman, and child in the country rides," says Parish. "One might fancy one's self in the land of centaurs, amidst a population half-men half-horses. Even beggars ride on horseback." Some of the cattle-farms are of immense extent: one in particular is mentioned by travellers as comprising more than 300 square miles of land, and yielding an enormous revenue to the proprietor. Some of the largest of them belong to British settlers, and are worked by British servants. The cattle were formerly hunted down and killed merely for the sake of their hides and tongues, while the carcases were abandoned to beasts and birds of prey. They are now slaughtered

in abattoirs, where every part of the animal is made avail-The beef is salted for exportation; the tallow is boiled down, and now forms an important item in the farmer's revenue; and the trade in hides is steadily increasing. Beef and an infusion of the native tea are the staple food of the natives. By the care of a few British colonists, sheep have of late years been extensively reared, and their wool is annually increasing in value. Till recently they were reputed so valueless that their carcases were used as fuel for kilns, &c. A decree of government ordained that no live sheep should be employed for this purpose. The number of cattle in the province is estimated at 12,000,000; of sheep, about the half of that number. The total value of exports from Buenos-Ayres in 1849 was L.2,537,821; in 1850, L.1,983,513; and in 1851, L.2,126,705. In this latter year, the value of the jerked beef exported was L.172,749; of hides, L.1,300,570; of tallow, L.217,690; of wool, L.190,060. The other exports consisted chiefly of hair, horns, bones, skins, and feathers. The value of imports into Buenos-Ayres may be stated approximately for the year 1851, at L.2,110,000; of which Great Britain contributes L.900,000; France, L.500,000; northern Europe, L.170,000; Gibraltar, Spain, and the Mediterranean, L.120,000; United States, L.200,000; Brazil and other countries, L.220,000. Of the cereals grown in Buenos-Ayres, the most important is maize, which is indigenous to the country. Wheat thrives well in the southern parts of the province, but the inhabitants rarely grow more than enough to supply their own necessities. In the event of a surplus, it is commonly exported to Brazil. Flax and hemp are cultivated with success. The vine, fig, orange, and olive, have been introduced from the old world, and are found to suit the climate admirably; but the most valuable of European fruits is the peach. A considerable fruit trade is carried on in coasting vessels, by merchants for the most part Italian or French. The geographical position of Buenos-Ayres is such as to enable it completely to control the foreign commercial relations of the entire confederation of which it forms a part. The exclusive policy which it has always pursued on this point has often involved it in serious quarrels, not only with many of the South American states and the other provinces of the Argentine Confederation, but with England and France. (See Buenos-Ayres, City of, and La Plata.) Since the expulsion of General Rosas, the navigation of the Parana and Uruguay has been thrown open, and other measures have been taken to place both the province and city of Buenos-Ayres on a level with the other provinces of the confederation. Buenos-Ayres has published a protest against any such measure, and the dispute is still unsettled. The only other towns in the province of any importance, besides the capital, are San Nicolas, which is situated on the Parana, about 200 miles N.W. of Buenos-Ayres, and contains a population of about 10,000; San Pedro, also on the Parana, about 150 miles from the capital in the same direction, with a population of 1000; Chascamas, on the shores of a cognominal lake, once a place of considerable importance, but seriously injured by the long continuance of the civil wars; and Belgrano, which from its position bids fair to become the rival of the capital itself.

BUENOS AYRES, the capital of the Argentine Confederation and of the province of Buenos-Ayres, is situated on the right bank of the estuary of the La Plata, in Lat. 34. 39. S. Long. 58. 18. W. The river is at this point so wide, that it is quite impossible with the naked eye to distinguish the opposite bank; and at the same time so shallow, that ships drawing 15 or 16 feet of water must anchor seven or eight miles from the city. Small craft generally anchor in what are called the inner roads, abreast of the city. As the depth of water is never sufficient to admit of their coming to shore, passengers and goods are landed by means of large-wheeled carts, which are either drawn or pushed by

Buenos Ayres. the requisite number of horses. The town of Buenos-Ayres is situated in a vast plain extending westwards to the Andes. The level uniformity of its outline is only broken by the spires of the various churches. The stranger, on landing, is struck with the regularity of the streets, which are quite straight, and intersect each other at distances of 150 yards forming squares like those of a chess-board, with the cleanly appearance of the houses, and the general air of independence that distinguishes the inhabitants. The only public buildings that have any pretensions to architectural beauty are the churches, which were built for the most part by the Jesuits. The houses have never more than two stories, and commonly only one, the rooms of which open into each other, and till lately were chiefly supplied with furniture of a very inferior description from the United States. A chimney was a thing unknown, as the old Spanish brazero alone was employed in heating the damp and white-washed rooms. A great change has, however, taken place in these respects within the last few years. The furniture is now supplied from Europe, the walls are papered, grates and chimneys have come into fashion, and English coal is burned at a lower price than it brings in the London market. These comforts are all the more valuable, as the climate of Buenos-Ayres is one of the most humid and changeable in the world. As the system of police is still somewhat of the rudest, the inhabitants are obliged to guard themselves and their property by means of the iron railings with which they protect the windows of the houses. Even this, however, is not always found to be an efficient safeguard against the dexterity of thieves. Though the city is built within 50 yards of the largest river in the world, the supplies of fresh water are both scanty and expensive. There are no public reservoirs or fountains, and the wells of the city yield only a brackish and disagreeable water. By the wealthier classes tanks are constructed, in which a sufficiency of rain-water for domestic purposes is collected from the roof of the house. The common people are obliged to purchase water from the water-carriers. As it is derived from the river, it is commonly muddy, and must stand for twenty-four hours till the sediment sinks to the bottom. It is then found to be excellent. The streets of the city are now tolerably paved with granite. Many of them, however, are still unpaved; and these in wet weather can hardly be traversed by a mounted horseman, and are utterly impassable by a person on foot. Floriculture is a favourite pursuit; and many English and Scotch gardeners have nurseries in the neighbourhood of the town.

Of the public buildings may be noticed the fortress, which is situated on the beach, and, besides guarding the town, serves as a residence for the president of the confederation; the cathedral, which is surmounted by a handsome dome, and has a large portico with twelve Corinthian pillars; the cabildo or town-house, in which justice is administered and the business of the municipality conducted; the churches of La Merced, San Francisco, and San Domingo; and the custom-house. The Plaza de la Victoria, round which some of these edifices are grouped, is the handsomest square in Buenos-Ayres. In the centre of it is a handsome monument, erected as a memorial of the war of independence. When the number of British residents in the town began rapidly to increase, application was made to General Rosas for a site for a church. This was immediately granted, and the minister for the time being set an example of liberality and toleration to his countrymen by laying the foundation-stone of the edifice, which cost in all about L.4000, half of which was defrayed by the British government. The Scottish residents, who muster about 1000, have recently built a small Presbyterian chapel; and the Roman Catholic portion of the English subjects are allowed the use of one of the national churches, in which a priest performs the service. In 1842 the Methodists erected a meeting-house,

which is used by all denominations of the British Dissenters. The Protestant Germans, who are pretty numerous, have a church in connexion with the Established Church of Prus-To each of these places of worship schools are attached for children of both sexes. The facilities for education are very considerable, and of these the inhabitants avail themselves extensively. Besides the denominational schools already alluded to, there is a university, attended by about 500 students, and possessing a valuable though not very extensive library. The sons of the wealthier families of the city are very frequently sent to Europe to complete their education at some of the great schools and colleges in France and England. The Buenos-Ayreans inherit from their ancestors much of that passion for music which characterizes the Spaniard, and are said to excel in this accomplishment. Poetry also is much cultivated among them; and a collection of lyrical ballads, under the title of Lira Argentina, is said to be well worth the notice of all lovers of Spanish verse. Besides its university, Buenos-Ayres contains many other literary and scientific institutions. Of these, the most important are the academy of medicine, the academy of jurisprudence, a special academy of mathematics and the physical sciences, a normal school, and a society for the promotion of agriculture. The charitable societies, though not very numerous, are rather important. Spanish is the lan guage spoken by the Buenos-Ayrean descendants of the old Spanish settlers, as well as by the native Indians, who constitute the bulk of the lower classes.

Buenos-Ayres was founded in 1535 by a Spanish expedition under Don Jorge de Mendoza, who landing at this place after many hardships, bestowed upon it the name it now bears in commemoration of the fine weather which prevailed at that time. At first he endeavoured to conciliate the native Indians, but hostilities soon broke out, and, despite their utmost efforts, the Spaniards were obliged to abandon the new settlement; and after almost incredible difficulties succeeded in reaching Assumption in Paraguay, with their numbers reduced by three-fourths. In 1580 another expedition under Don Juan de Garay took possession of the site of the old fort and established themselves there, founding cities and establishing settlements in every direction with such success, that in 1620 a new government was erected, under the name of the government of the Rio de la Plata. Buenos-Ayres became the capital, and the seat of a new bishopric created at this time by Pope Paul V., at the request of Philip III. of Spain. After the lapse of a century, Buenos-Ayres began to rise into such importance as to excite the jealousy and alarm of the home government. The insane restrictions imposed upon her foreign and internal commerce led only to continual heart-burnings with the parent country, and Buenos-Ayres soon became a rendezvous for the smugglers of such nations as were strong enough to set Spain at defiance. After numerous modifications of its government, and of its relations to the parent state, the provinces of the Rio de la Plata were in 1776 erected into a vice-royalty, of which Buenos-Ayres continued to be the capital. Two years later the old commercial restrictions were abolished and a new commercial code promulgated, so liberal as to be called the "Free-Trade Regulations." According to the old system the Buenos-Ayreans were only allowed to export merchandise to the Portuguese settlements in Brazil, and the quantity was limited to 2000 fanegas of wheat, 500 quintals of jerked beef, and 500 of tallow. All intercourse with other countries was strictly prohibited. By the new system, nine ports in Spain and twenty-four in the colonies were declared puertos habilitados, or ports of entry. The effects of the new policy were immediately visible. Of hides, for instance, the staple commodity of the country, the exports to Spain before 1778 only amounted to 150,000 annually; after that year they rose to from 700,000 to 800,000. In 1805, and

Buenos-Ayres. though the natives applied for assistance to the home authorities, they were told that they must defend themselves as they best might, as Spain could send them no help. They accordingly rose in arms, and twice expelled the invaders. In the following year they were threatened with invasion by the prince regent of Portugal. The resolution which they displayed on the occasion prevented that prince from insisting upon his claims. In 1810 the circumstances of the country involved the establishment of a provisional junta; a policy which was construed by the Spanish cortes into an act of rebellion. A civil war ensued; and Ferdinand, on his restoration after the expulsion of the French from Spain, instead of trying to conciliate the malcontents by timely concessions, obstinately refused to accede to their lawful demands. The result of this was that, on the 9th of July 1816, deputies from the provinces of the Rio de la Plata assembled in congress at Tucuman, solemnly declared their separation from Spain, and their determination to constitute a free and independent state. Buenos-Ayres continued to be the capital of the new republic, which was governed by authorities constituted in that city. The exclusive policy of the capital soon bred discontent in the provinces, the governors of which began to cry out for a federation in opposition to the central government of Buenos-Ayres. their influence the new constitution, which conferred on a chief magistrate residing in the capital very extensive civil and military powers over the whole republic, was repudiated, and a civil war was the consequence. Various assemblies were held, and attempts were made to establish the constitution on a sufficiently wide basis to reconcile the interests of all parties-but always without success; and from 1827 till the expulsion of Rosas in 1852, no meetings of the constituent assembly took place. After 1827, the Confederation was obliged to delegate to the executive government of Buenos-Ayres the undivided charge of the national business, such as the management of the public debt, the maintenance of relations with foreign powers, the defence of the country in the event of war, &c. While these internal dissensions were going on, war was declared between the young confederation and the empire of Brazil, and Buenos-Ayres was blockaded for a year and a half by a Brazilian fleet. In 1828, however, the siege was raised by the intervention of the English. This foreign war thus ended, the civil war broke out once more, and was only temporarily checked by the accession of General Rosas to power in 1835. Aiming at territorial aggrandizement, Rosas soon became involved in war with the neighbouring states of Paraguay and Uruguay. England, France, and Brazil interfered, with the intention of effecting an amicable arrangement between the helligerents. Rosas rejected their mediation; and the united fleets of England and France took possession of the Buenos-Ayrean fleet which was engaged in the siege of Monte Video, and opened the navigation of the Parana to the merchantmen of all nations. In the subsequent operations Rosas sustained severe losses, yet obstinately refused to yield. In 1848 the English fleet returned home, and was followed by the French in the following year. Brazil was now left to carry on the war alone, but she found ready allies in some of the provinces of the Argentine Confederation, which had long regarded with hatred and aversion the supremacy arrogated by Buenos-Ayres. With the assistance of these and the adjoining states of Uruguay and Paraguay, a large army was raised, which, under the command of General Urquiza, defeated Rosas at the battle of Monte Caseros, February 3, 1852. Rosas after his downfal fled to England. Urquiza was appointed provisional director of the confederation; but the Buenos-Ayreans protested against his policy, which threatened to undermine the prerogatives they had been long struggling to secure. Civil war again broke out; and

again in 1807, the British invaded Buenos-Ayres; and in 1853 Buenos-Ayres was besieged by the forces of the though the natives applied for assistance to the home authorities, they were told that they must defend themselves as siege was raised, and a temporary accommodation effected.

BUFFALMACCO, the designation of a wit and painter who lived at Florence about the end of the thirteenth century. His real name was Buonamico di Cristofano, but his witticisms are recorded under the other name in the Decameron of Boccaccio and the Novelle of Sacchetti. His best pictures have perished, but specimens of his works remain in the Campo Santo of Pisa and at Arezzo. In those his style is mean, and without the grace of Giotto; but there is vigour in some of his conceptions, as in the Crucifixion. Lanzi says he was alive in 1351, though Vasari says he died in poverty in 1340.

BUFFALO, Bubalus. See MAMMALIA.

BUFFALO, a city and port of entry, capital of the county of Erie, in the state of New York, United States, North America, is situated on Buffalo Creek, which forms its harbour at the west extremity of Lake Erie, where it contracts to form the Niagara river. It was founded in 1801, but for some time made so little progress, that when burned by the British in 1814 it did not contain more than 200 houses. Its prosperity dates from the formation of the Erie canal, which establishes a navigable communication between the lake and the Hudson river. Since that period its growth has been so rapid, that in point of population it ranks as the fourth city in the state, and the twelfth in the union; and as a commercial city is surpassed by only three or four. The city is built on a gradual ascent, extending for two miles from the water to an extended plain, and from the higher parts affording fine views of the surrounding scenery. It has three public squares, and the streets are broad and regular, consisting of numerous elegant buildings and extensive warehouses. The public buildings are a courthouse, jail, two markets, the city offices, churches, banks, theatre, &c. Among the benevolent institutions are the orphan asylum, city hospital, hospital of the Sisters of Charity, female orphan asylum, and Association for the Relief of the Poor. There are numerous public schools open to all children, and many academies and private schools. The university of Buffalo was chartered in 1846, and has a medical school. The young men's association has a library of about 7000 volumes, a museum, and a reading-room amply supplied with periodicals and newspapers. The German young men's association is a similar institution, with a library of 2000 volumes. Buffalo has about 40 churches, 10 banks, 1 savings-bank, and, including agencies, upwards of 40 insurance companies.

The harbour is spacious and safe, and has for a mile from its entrance a depth of 13 or 14 feet of water. To obviate the bar at its mouth, a pier 1500 feet in length with a lighthouse at its extremity has been constructed, so that vessels drawing eight feet enter without difficulty. Farther improvements have been proposed. In 1852, 929 vessels of 135,866 tons burden entered, and 1066 vessels of 147,505 tons cleared out in the foreign trade; and 3738 vessels of 1,403,672 tons entered, and 3708 vessels of 1,405,203 tons cleared out in the coasting trade. The shipping belonging to the district at the end of that year was 59 steamers of 30,126 tons, and 134 sailing vessels of 26,397 tons. The Grand Erie canal was commenced in 1817 and completed in 1825. It is 363 miles long and 40 feet wide.

The city is divided into five wards, and is governed by a mayor and common council. Shipbuilding is extensively carried on. Extensive lines of railway connect Buffalo with the eastern and western states and Canada. Pop. (1810) 1508; (1820) 2095; (1830) 8653; (1840) 18,213; (1850) 42,260. Its present population (1854) is estimated at 70,000.

BUFFET (French buffet), was anciently a little apartment for holding china, glass-ware, &c., erected on one side.

Buffier Buffon.

of a room, from which it was separated by slender wooden columns. It is now very generally superseded by the sideboard. In the houses of persons of distinction in France. the buffet was a detached room, decorated with pictures relative to the subject, with fountains, cisterns, vases, &c.

BUFFIER, CLAUDE, a distinguished writer, born in Poland in 1661, of a French family settled at Rouen, in which city he received his earlier education. He became a Jesuit in 1679, and died at Paris in 1737. There are many works by this author, showing deep penetration and accurate judgment. The principal of these is entitled UnCours des Sciences, or a Course of Sciences, upon principles new and simple, in order to form the language, the understanding, and the heart. Paris 1732, in folio. He was the author of several other works, particularly  $Pratique\ de$ la Memoire artificielle, Paris, 1715, 4 vols. 12mo; An Introduction to the History of the Sovereign Houses of Europe; An Abridgment of Spanish History; An Account of the Origin of the Kingdom of Sicily and Naples; and various treatises on religion and piety. In his Cours des Sciences Buffier has anticipated, though he failed to develop and pursue to its consequences, that peculiar system of mental philosophy which resolves all the ultimate principles of belief into the perceptions or suggestions of what is called common sense; and indeed it seems pretty certain that Dr Reid has been indebted to the learned Jesuit for valuable hints on nearly all the purely speculative points

treated of in his Intellectual Philosophy.

BUFFON, GEORGE LOUIS LE CLERC, COMTE DE, a celebrated naturalist, was born at Montbard in Burgundy, on the 7th of September 1707. His father, Benjamin le Clerc, was a counsellor of the parliament of Dijon; and the son was destined to the same office, if science had not drawn him away from the law. He studied at Dijon; and his eager activity, his acuteness, penetration, and robust constitution, fitted him to pursue business and pleasure with equal ardour His early passion was for astronomy; and the young Le Clerc was seldom without Euclid in his pocket. At the age of twenty he travelled in Italy in company with the young Duke of Kingston and his tutor; but he overlooked the choicest remains of art, and amidst the ruins of an elegant and luxurious people he first felt the charms of natural history, of which he afterwards proved the zealous and successful expounder. On his return to France he fought, on some accidental quarrel, with an Englishman, whom he wounded, and in consequence was obliged to retire to Paris, where he translated Newton's Fluxions from the Latin, and Hales's Statics from the English into the French language. He went to England at the age of twenty-five, and remained there about three months. This concluded his travels. Having at the age of twenty-one succeeded to the estate of his mother, which was valued at about 300,000 livres, or L.12,000 sterling, he was enabled to pursue the career of letters without any of the difficulties that often beset literary men. Perhaps this was the period of his retirement to Montbard, where he spent much of his time, and where his leisure was little interrupted; for whilst he resided in the capital, his office of intendant of the king's garden and cabinet engrossed much of his attention. He spent fourteen hours every day in study; yet when we examine the extent of his knowledge and the number of his works, we wonder at his having accomplished so much even in that time. At five in the morning he retired to a pavilion in his vast gardens, and he was then inaccessible. This was, as Prince Henry of Prussia called it, the cradle of natural history; but she was indifferently accommodated. The walls were naked; and an old writing-table, with pen, ink, and paper, and an elbow-chair of black leather, were the only furniture of his study. His manuscripts were in a cabinet in another building, and he went occasionally from one to the other. The eras of Buffon's works are pretty well known. When

each was finished it was put aside, in order that he might Buffoon forget it, and afterwards return to it with the severity of a disinterested critic. He was anxious to render it perspicuous; and if those to whom he read his works hesitated a moment, he changed the passage. The works of others he often read like Magliabechi, confining himself to the titles, the contents, and the most interesting parts; but he perused M. Neckar's Compte Rendu, and the Adminstration of the Finances, from beginning to end, and spoke of them with no little enthusiasm. His favourite authors were Féné-

lon, Montesquieu, and Richardson. M. de Buffon's conversation was unadorned, rarely animated, but sometimes very cheerful. He was exact in his dress, particularly in arranging his hair. He liked to sit long at table; at which time his conversation was unembarrassed, and his guests had frequently occasion to notice some happy turn of phrase, or some deep reflection. His self complaisance was very considerable. He loved praise, and even praised himself; yet it was with such frankness, and with so little contempt of others, that it was seldom disagreeable. Indeed, when we consider the extent of his reputation, the credit of his works, and the attention with which they were always received, we can scarcely be surprised that he was apt to appear conscious of his own value. It may here be proper to observe, that although the works of this philosopher afford grounds for the charge of infidelity brought against him, yet it would appear that he was able to give to the Sorbonne a satisfactory explanation of the offensive passages. At the same time, however, the interests of religion and morality require that the licentiousness of his conduct, and his enmity to the Christian faith, should not be passed over in silence. The longevity of Buffon's family was somewhat remarkable. His father lived to the age of ninety-three; his grandfather to that of eightyseven; and the subject of the present memoir exceeded eighty. In his latter years he suffered severely from the stone, but would never submit to the operation of lithotomy. He died at Paris on the 16th of April 1788. He left one son, who erected in the gardens of Montbard a low column with an inscription to his memory. This son, who was a colonel of cavalry, fell a victim to the tyranny of Robespierre, only fifteen days before the downfal of that monster.

The editions of the several works of Buffon are numerous. An edition of the whole has been published in 35 vols. 4to;

and another in 62 vols. 12mo.

BUFFOON, a droll, or mimic. Ménage, after Salmasius, derives the word from buffo, a name given to those who appeared on the Roman stage with their cheeks blown up; that receiving blows thereon they might make the greater noise, and excite the laughter of the people. Others, as Rhodiginus, make the origin of buffoonery more venerable, deriving it from the feast called buphonia, instituted in Attica by Erechtheus.

Buffoons were variously denominated scurræ, gelasiani, minologi, ministelli, and joculatores, and their exhibitions were chiefly at the tables of the great. Gallienus never sat down to meals without a second table of buffoons by him. Tillemont also renders pantomimes by buffoons; in which sense, he observes, the shows of the buffoons were taken away by Domitian, restored by Nerva, and finally abolished by Trajan.

BUG. See Entomology, and Vermin.

BUGARES (Bulgarii), anciently signified a kind of heretics, otherwise called Paterini, Cathari, and Albi-The word is formed from the French Bougres, and that from Bougria or Bulgaria, the country where they chiefly appeared. Among other errors, they held that men ought to believe no scripture but the New Testament; that baptism was not necessary to infants; that priests who were married could not be saved; and that an oath was unlawful. They were strenuously refuted by Friar Robert, a DominiBugia can, when the can building the can, when the can be can, when the can building the the can buildin

can, who had formerly professed this heresy. They are thus mentioned by Matthew Paris, who lived in the reign of Henry III.: Circa dies autem illos invaluit hæretica pravitas eorum qui vulgariter dicuntur Paterini et Bugares,

de quorum erroribus malo tacere quam loqui.

BUGIA or BOUGIAH, a fortified seaport town of Algeria, in the regency of, and 112 miles east of, the town of Algiers. It has a very picturesque appearance, being built in the form of an amphitheatre on a bay of the Mediterranean, and encircled by a lofty chain of mountains. Its principal exports are wax, oil, and dried fruits. The European population in 1850 was 847. It was taken possession of by the French in 1833.

BUGLE-Horn, a small brass instrument used in the hunting-field, and in cavalry regiments. The compass of the bugle is now extended by finger-keys. See Appendix

to Music.

BUHL, ornamental wood-work inlaid with mother-ofpearl, brass, &c. The name is derived from the inventor.

BUILDER, in the general sense of the term, an undertaker of works of building. With reference to the operations of civil architecture particularly, the builder stands between the proprietor and architect on the one hand, and the artizan, merchant, and manufacturer on the other: he engages to the first to carry a certain proposed work into execution, as he may be directed by the second, and saves to both of them the trouble and responsibility of procuring materials and employing workmen.

The builder's emolument arises from an improved price, or charges bearing an advance on the prime cost, to remunerate him for the use of his capital in materials, workshops, plant, and labour, and his own personal application and risk. A builder has the power also of deriving an advantage from the division of labour, by employing artizans in those operations only which habit enables them to execute with the

greatest facility.

The builder contracts to do certain specified works for a certain total sum of money, the amount of which he de-

termines by a previous estimate; or to do prescribed opera- Building. tions, at so much for a certain fixed quantity of every sort involved, per yard, per rod, per foot, and so on, the amount to be ascertained, when they are completed, by measurement; or he executes works according to instructions or specifications, leaving the charges to be determined according to the usual and accustomed rates, on the quantities ascertained by admeasurement. In the two former cases he is said to work by contract, and in the last by measure and value. For jobbing, in repairs and alterations, a day account is kept; that is, a record of the time workmen are employed, and of the materials used, in performing certain operations. This is made out with an advance of so much per cent. on the prime cost, or wages of the workmen and selling prices of the unwrought materials, for the builder's profit or remuneration, as before stated.

A builder should be theoretically acquainted with the principles of construction, and practically conversant with the details of all the mechanic arts used in building; as well to be enabled to carry on his business with advantage to his own interest, as to the proper execution of the works he may undertake. He should be qualified to ascertain with the utmost minuteness, from the drawings of a design, and the specification of the manner in which, and matter of which, it is to be carried into execution, the quantity of labour, and materials of every kind and description, and the exact value of them all. In this is involved the necessity of being well acquainted with the market prices of raw and manufactured articles to a very great extent, and a matured judgment of the quantity of labour required, or how much time a workman will take to produce a certain result. These things, however, which involve the making of estimates on which to make contracts, in the practice of this country are generally referred to a surveyor or measurer, because of the general ignorance and incompetence of builders, or because of the greater aptitude of the latter, in consequence of their attention being solely occupied by such

things.

## BUILDING.

THE art of building comprises the practice of civil architecture, or the mechanical operations necessary to carry the designs of the architect into effect. It is not unfrequently called practical architecture; but the adoption of this term would have tended only to confuse, by rendering it difficult to make the distinction generally understood between architecture as a fine or liberal art, and architecture as a mechanical art. The execution of works of architecture necessarily includes building; but building is frequently employed when the result is not architectural: a man may be a competent builder without being an architect; but no one can be an accomplished architect unless he be competent to specify and direct all the operations of building. A scientific knowledge of the principles of masonry, carpentry, joinery, &c., and of the qualities, strength, and resistance of materials, though of the utmost importance to an architect, must be attended by a minute acquaintance with a great variety of less ambitious details. Such are those which relate to the arrangement of a plan for the greatest possible degree of convenience on the smallest space, and at the least expense; its transference to the ground; the preparation and formation of foundations; the arrangement and construction of drains, sewers, and ventshafts; the varieties of walling with stone, and of laying bricks in brick-work; the merit of the various modes of bonding and tying walls, both lengthwise and across; the arrangement of gutters on roofs, to get sufficient fall, and to conduct the water to the least inconvenient places

for fixing trunks to lead it down; the arrangement and formation of flues; the protection of walls from damp, ot timber from moisture and stagnant air, and of metals generally from exciting causes; the cost of materials and labour, and the quantity of each required to produce certain results. Together with these, an architect ought to be practically acquainted with all the modes of operation in all the trades or arts employed in building. Everything must be clearly understood, or it will be impossible properly to specify beforehand, in detail, everything and every operation to be done and performed; and minutely to estimate, beforehand also, the absolute cost involved in the execution of a proposed structure. The power to do the latter necessarily involves that of measuring work, and ascertaining quantities after it is done. These things may certainly be referred to the surveyor or measurer, but they are not the less incumbent on the architect, who cannot be said to be thoroughly master of building, or the practice of his profession, unless he be skilled in these operations.

The architect having furnished the specification and working drawings of his design, the first step in the process is to prepare the foundation. (See article Stone-Masoney, sect. 60.) Much in this particular, it is evident, must depend on localities. It is not of so much importance that the ground be hard, or even rocky, as that it be compact, and of similar consistence throughout; that it be so constituted as to resist entirely and throughout, or yield

equally to the superincumbent weight.

Building.

But in the ordinary processes of building, the artificial preparation of foundations hardly need be considered. Common prudence would refer it to professional management, when such is found necessary; and a work of this kind cannot contain sufficient information and instruction to qualify a man to act professionally on any subject, and more particularly on those subjects which demand initiatory practice and experience. We therefore proceed to the ordinary routine of practice.

The artificers whose trades come within the immediate range of the builder's business are the following: Digger or excavator, bricklayer, mason, slater, sawyer, carpenter, joiner, plasterer, modeller, carver and gilder, plumber,

smith, glazier, painter and decorator.

Digger or Excavator.—The digger works with a pickaxe and a spade or shovel. With the pick-axe he breaks down the soil if it be hard or very stiff, and throws it out with the shovel; but compacted sand and alluvial soil is spitted and thrown out with the spade alone, without previous breaking down. When rock occurs in a foundation, the assistance of the quarryman is requisite to cut through or blast it, as the occasion may require. The digger should be required to produce a perfect level in every direction, and especially in trenches for walls; nor may this be done by placing again loose matter, but the level must be produced on the solid or undisturbed bed.

Digger's work is valued by the cubic yard, and is generally made to include, besides excavating, the removal of the soil and rubbish. The price per yard is therefore necessarily contingent on the stiffness of the soil, the depth to which the excavations may reach below the surface, and the distance the stuff is to be removed; so that it is impossible to determine what the cost may be, without reference to each and all of these particulars, most of which must be different in every different place; and all are again affected by the local cost of labour or wages. A good excavator will dig and throw out, of common soil, into a basket or wheelbarrow, eight or ten yards per diem; but of stiff clay or firm gravel, not more than six yards.

Bricklayer .- The manufacture of brick being made the subject of a separate article, we need only refer to that for information on the subject; and in the same manner the components and merits of mortars and cements will be found in sections 20 et seqq. of the article under the head STONE-MASONRY. A few observations on the composition of mortar for bricklaying will nevertheless be necessary here.

Particular attention must be paid to cleansing the sand to be used for mortar of every particle of clay or mud that may adhere to or be mixed up with it. Sea sand is objectionable for two reasons; it cannot be perfectly freed from a saline taint, and the particles are moreover generally rounded by attrition, caused by the action of the sea, which makes it less efficient for mortar than if they retained their natural angular forms. Lime should not be slaked until the moment it is to be mixed up with the sand in mortar, but the sooner that is done after it is burnt the better. The proportion of lime to sand is generally taken at as much as one-fourth of the whole mass; but if both the materials be of good quality, that is, if the lime slake freely, and become a fine pungent impalpable powder, perfectly clear from argillaceous or any other foreign matter, and the sand clean and sharp, and of variously sized particles, one-fifth of lime to sand is quite enough: more is injurious. The ingredients should be well mixed together, and with water, and as little water used as will suffice to make the compound consistent and paste-like. Rain, or any other soft water, should be used for the purpose of making mortar, and not spring or hard water, though any other may be preferred to what is brackish even in the slightest degree. A quick-setting cement, such as that which is most commonly used in building in this country, and known as Parker's or Roman cement, can only be mixed or gauged as it is required for use. A bricklayer will keep a labourer fully em-ployed in gauging cement for him alone. It is mixed with sand in the same manner that lime is in common mortar, in the proportion of about two or three of sand to one of cement, according to the quality of the latter; and the labourer, as he gauges on one board, supplies the mixture to the bricklayer fit for use on another board, a spadeful at a time: it must then be applied within half a minute, or it sets and is spoiled.

The average size of bricks in this country is a fraction under

nine inches long, four and a half wide, and two and a half inches Building. thick; and in consequence of this uniformity of size, a wall of this material is described as of so many bricks in thickness, or of the number of inches which result from multiplying nine inches by any number of bricks; a nine-inch or one-brick wall; a fourteeninch wall, or one brick and a half (131 inches would be more correct, in fact, for although a joint of mortar must occur in this thickness, yet the fraction under the given size of the brick is enough to form it); eighteen-inch or two bricks, and so on.

The great art in bricklaying is to preserve and maintain a bond, to have every course perfectly horizontal, both longitudinally and transversely, and perfectly plumb; which last, however, may not mean upright, though that is the general acceptation of the term, for the plumb-rule may be made to suit any required inclination, as inward against a bank, for instance, or in a tapering tower; and also to make the vertical joints recur perpendicularly over each other: this is vulgarly and technically called keeping the perpends. By bond in brick-work is intended that arrangement which shall make the bricks of every course cover the joints of those in the course below it, and so tend to make the whole mass or combination of bricks act as much together, or dependently one upon another, as possible. The object of this will be understood by reference to the diagram, fig. 1. Here it is evident, from the arrange-Plato ment of the bricks, that any weight placed on a would (supposing, CXLVIL as we are obliged to suppose, that every brick feels equally, throughout its whole length, a stress laid on any part of it) be carried down and borne alike in every course from b to c; in the same manner the brick d is upborne by every brick in the line ef, and so throughout the structure. But this forms a longitudinal bond only, which cannot extend its influence beyond the width of the brick; and a wall of one brick and a half or two bricks thick, built in this manner, would, in effect, consist of three or four half-brick-thick walls. acting independently of each other, as shown in the plan at i, in the diagram, under fig. 1. If the bricks were turned so as to show their short sides or ends in front, instead of their long ones, certainly a compact wall of a whole brick in thickness would be produced; but the longitudinal bond would be shortened one-half, as at g c h, and a wall of any greater thickness, in the same manner, must be composed of so many independent one-brick walls, as at k in the plan before referred to. To obviate this, to produce a transverse, and yet preserve a true longitudinal bond, the bricks are laid in alternate courses of headers and stretchers, or of ends and sides, as shown in fig. 2, thus combining the advantages of the two modes of arrangement a b c and g c h fig. 1, in a b c fig. 2. Each brick in fig. 2 showing its long side in front, or being a stretcher, will have another lying parallel to it, and on the same level, on the other side, to receive the other ends of the bricks showing as headers in front, which in their turn bind, by covering the joint between them, as shown in the end of such a wall at d. Thus a well-bonded nine-inch or one-brick wall is produced. The end elevations of the same wall at e and f show how the process of bonding is pursued in walls of one and a half and two bricks thick, the stretcher being abutted in the same course by a header; thus, in a fourteen-inch wall inverting the appearance on the opposite sides, as seen at e, and producing the same appearance in an eighteen-inch wall, as at In the diagram under fig. 2, at g, is the plan of a fourteen-inch wall, showing the headers on one side, and the stretchers on the other, and at h is the plan of the course immediately above it, in which the headers and stretchers are inverted; at k and i are shown, in the same manner, the plans of two courses of an eighteen-inch wall. This is called English bond. Thicker walls are constructed in the same manner by the extension of the same principle.

But a brick being exactly half its length in breadth, it is impossible, commencing from a vertical end or quoin, to make a bond with whole bricks, as the joints must of necessity fall one over the other. This difficulty is obviated by cutting a brick longitudinally into two equal parts, which are called half headers. One of these is placed next to a whole header, inward from the angle, and forms with it a three-quarter length between the stretchers above and below, thus making a regular overlap, which may then be preserved throughout: half headers so applied are technically termed closers. (See the joints in the heading courses next the upright angle of the wall fig. 2, and the first joints inwards from the square ends by the headers in the plans at g and h.) A three-quarter stretcher is obviously as available for this purpose as a half header, but the latter is preferred, because, by the use of it, uniformity of appearance is preserved, and whole bricks are retained on the returns. In walls of almost all thicknesses above nine inches, to preserve the transverse, and yet not destroy the longitudinal bond, it is frequently necessary to use half bricks; but it becomes a question whether more is not lost in the general firmness and consistence of the wall by that necessity, than is gained in the uniformity of the bond. It may certainly be taken as a general rule, that a brick should never be cut if it can be worked in whole, for a new joint

Building. is thereby created in a construction, the difficulty of which consists in obviating the debility arising from the constant recurrence of joints. Great attention should be paid to this, especially in the quoins of buildings, in which half bricks most readily occur; and there it is not only of consequence to have the greatest degree of consistence, but the quarter bricks used as closers are already admitted, and the weakness consequent on their admission would only be increased by the use of other bats, or fragments of bricks.

Another mode of bonding brick-work, which may be supposed to have arisen from the appearance of the ends of a wall according to the former mode of arrangement (see e and f, fig. 2), instead of placing the bricks in alternate courses of headers and stretchers, places headers and stretchers alternately in the same course, fig. 3. The plans below this at c and d are of two courses of a fourteeninch wall, with their bond, showing in what manner the joints are broken in the wall horizontally as well as vertically on its face. This is called Flemish bond. Closers are necessary to both varieties of bond, in the same manner, and for the same purpose; half bricks also will occur in both, but what has been said with reference to the use of them in the former applies even with more force to the latter, for they are more frequent in Flemish than in English, and its transverse tie is thereby rendered less strong. Their occurrence is a disadvantage which every care should be taken to obviate. The arrangement of the joints, however, in Flemish bond, presenting a neater appearance than that of English bond, it is generally preferred for external walls when their outer faces are not to be covered with stucco, or plaster composition of any kind; but English bond should have the preference when the greatest degree of strength and compactness is considered of the highest importance, because it affords, as we have already noticed, a better transverse tie than the other. It is a curious fact, that what is in England called Flemish bond in brick-work is unknown in Flanders, and, so far as the observation of the present writer has extended, is practised in the British Isles alone. In Flanders, Holland, and Rhenish Germany, which are all brick-laying countries, no kind of bond is found but what is known in England as English bond.

It has been attempted to improve the bond in thick walls by laying raking courses in the core between external stretching courses, and reversing the rake when the course recurs. This obviates whatever necessity may exist of using half bricks in the heading courses, but it leaves triangular interstices to be filled up with bats, as the diagram fig. 4 shows. This represents the plan of a thirty-six inch or three-brick wall with raking courses at a, between external ranges of stretchers, and lying on a complete course of headers, and at b a wall of the same thickness herring-boned; courses of headers would bed and cover this also, and, in the second course above, the raking or herring-boning would be repeated, but the direction of the bricks inverted. It will be seen that the latter demands, in addition to the triangular filling-in bats at the outer ends of the diagonally placed bricks, half bricks to fill up the central line of interstices, rendering herring-boning more objectionable in that particular, though it has some advantages over simply raking, or thorough diagonal courses, in some other points. Neither mode should, however, be recurred to for walls of a less thickness than three bricks, and that indeed is almost too thin to admit of any great advantage from it.

Skilful and ingenious workmen are well aware of the necessity of attending to the bond, and are ready both to suggest and to receive and practise an improvement; but generally the workmen themselves are both ignorant of its importance and careless in preserving it, even according to the common modes. Their work should therefore be strictly supervised as they proceed with it; for many of the failures which are constantly occurring may be referred to their ignorance or carelessness in this particular.

Not second in importance to bonding in brick-work is, that it be perfectly plumb, or vertical, and that every course be perfectly horizontal, or level, both longitudinally and transversely. The lowest course in the footings of a brick wall should be laid with the strictest attention to this latter particular; for the bricks being of equal thickness throughout, the slightest irregularity or incorrectness in that will be carried into the superimposing courses, and can only be rectified by using a greater or less quantity of mortar in one part or another, so that the wall will of course yield unequally to the superincumbent weight, as the work goes on, and perpetuate the infirmity. To save the trouble of keeping the plumb-rule and level constantly in his hands, and yet to insure correct work, the bricklayer, on clearing the footings of a wall, builds up six or eight courses at the external angles (see fig. 5), which he carefully plumbs and levels across, and from one to the other. These form a gauge for the intervening parts of the courses, a line being tightly strained from one end to the other, resting on the upper and outer angles of the gauge bricks of the next course to be laid, as at  $\alpha$  and b, fig. 5, and with this he makes his work range. If, however, the length be great, the line will of course sag; and it must therefore be carefully set and propped at sufficient intervals. Having carried up Building. three or four courses to a level, with the guidance of the line, the work should be proved with the level and plumb-rule, and particularly with the latter at the quoins and reveals, as well as on the face: a smart tap with the end of the handle of the trowel will generally suffice to make a brick yield what little it may be out, while the work is so green, and not injure it. Good workmen, however, take a pride in showing how correctly their work will plumb without tapping. To work which is circular on the plan, both the level and the plumb-rule must be used, together with a gauge-mould or a ranging trammel, to every course, as it must be evident that the line cannot be applied to such in the manner just described. To every wall of more than one brick thick, two men should be employed at the same time, one outside and the other in: one man cannot do justice from one side, even to a fourteen-inch wall. Inferior workmen and apprentices are generally employed as inside men, though the work there is of quite as great importance as exteriorly, except for neatness, and for that only if the brickwork is to show on the outside.

In the operation of bricklaying, the workman holds the trowel in his right hand, and with the left he takes up the bricks from the scaffold, and lays them in their places. Spooning or shovelling up mortar from the board with the trowel, he throws it on the course last laid, and with the point strews it over the surface to form a bed for that which he is about to set; whatever bulges or projects over the outer edge of the work below is struck off, and being caught on the flat face of the trowel, is put against the side or end of the last brick laid in the new course. Then taking up a brick, he presses it down in its place until its upper and outer angle comes exactly to the line; and if this be not readily effected by the hand, a slight drawing blow with the obtuse point of the edge of the trowel does it, or a tap with the end of the handle both draws it and settles it down farther than the hand can press it. The small quantity of mortar that is pressed out in front, by this operation, being struck off, the joints are neatly drawn by compressing the mortar with the point of the trowel, and thus producing a fine smooth surface,that is, if the work is to be seen; for if it is to be plastered, the rough face is left that the plastering may the more readily attach itself, and the joint is not drawn at all, but the workman proceeds in the same manner with the next brick in advance along the course, or to fill in behind the one he has laid in front to meet the work of his mate on the other side of the same wall. This is the common mode of laying bricks. They should not however be merely laid; every brick should be rubbed and pressed down in such a manner as to force the slimy matter of the mortar into the pores of the bricks, and so produce absolute adhesion. Moreover, to make brickwork as good and perfect as it may be, every brick should be made damp, or even wet, before it is laid, otherwise it immediately absorbs the moisture of the mortar, and, its surface being covered with dry dust, and its pores full of air, no adhesion can take place; but if the brick be damp, and the mortar moist, the dust is enveloped in the cementitious matter of the mortar, which also enters the pores of the brick, so that when the water evaporates, their attachment is complete, the retention and access of air being thus altogether precluded. To wet the bricks before they were carried on to the scaffold would, by making them heavier, add materially to the labour of carrying: in dry weather they would, moreover, become dry again before they could be used; and for the bricklayer to wet every brick himself would be an unnecessary waste of his time: boys might therefore be advantageously employed to dip the bricks on the scaffold, and supply them in a damp state to the brick-layer's hand. A watering pot with a fine rose to it should also be used to moisten the upper surface of the last laid course of bricks, preparatory to strewing the mortar over it. In bricklaying with quick-setting cements these things are of even more importance; indeed, unless the bricks are quite wet to be set with cement, it will not attach itself to them at all.

As mortar is a more yielding material, used in brick-work merely for the purpose of making the detached portions of the staple adhere, by filling up their interstices and producing exhaustion, and the object being to produce as unyielding and consistent a mass as possible, as much of it should be used as is sufficient to produce the desired result, and no more. No two bricks should be allowed to touch, because of their inaptitude to adhere to each other; and no space between them should be left unoccupied by mortar which may produce adhesion. When the bricks are a fraction under two-anda-half inches thick, no four courses of bricks and mortar, or brickwork, should exceed eleven inches in height; and if they are fully that thickness, four courses should not reach eleven and a half inches. The result of thick beds of mortar between the bricks is, that the mortar is pressed out after the joint is drawn, on the outside, in front; and being made convex instead of slightly concave, the joints catch every drop of rain that may trickle down the face of the wall, and are thus saturated; the moisture freezes, and in thawing bursts

Building. the mortar, which crumbles away, and creates the necessity which is constantly recurring, of pointing the joints to preserve the wall.

> 4 841111Vil. 14 /3/1.164

The diagram shows the section of a nine-inch wall, with the joints on the side a as drawn, and on the side b as bulged, in consequence of the quantity of mortar in them yielding to the weight above. This, too, is in addition to the inconvenient settling, which is the consequence of using too much mortar in the beds.

In practice, bricklayers lay the mortar on the course last finished, and spread it over the surface with the trowel, without considering, or caring for

it, that they have put no mortar between the bricks of that course, except in the external edges of the outside joints; that the mortar is not, or ought not to be, so thin as to fall into the joints by its own weight; and that unless they press it down, half the height of the space between the bricks remains in every case unoccupied, and the wall is consequently hollow, incompact, and necessarily imperfect. To obviate this, it is common to have thick walls grouted in every course; that is, mortar made liquid, and called grout, is poured on and spread over the surface of the work, that it may run in and fill up the joints completely. This, at the best, is but doing with grout what should be done with mortar; and the difference between the two consisting merely in the difference in the quantity of water they contain, mortar must be considered the best; for the tendency of grout is, by hydrostatic pressure, to burst the wall in which it is employed; and, moreover, it must, by taking a much longer time to dry and shrink than the mortar of the beds and external joints, make and keep the whole mass unstable, and tend to injure rather than benefit it. Filling or flushing up every course with mortar is therefore far preferable, and may be done with very little additional exertion on the part of the workman.

It is a very common thing for two sorts of mortar to be used in the same wall, a finer and whiter for the outside, and a coarser for the inside work; the former made of cleaner and finer sand, and a greater quantity of lime, than the latter, with the intention of exposing a better-looking and more durable material to the view and the weather. The sand, we have already shown, ought to be as clean as it can be made for mortar to be used in bricklaying; therefore there should be no possibility of making a difference in that particular; and the addition of a greater quantity of lime than is necessary to make good mortar makes it less durable, and occasions a sacrifice in an important quality for the sake of an unimportant advantage. Moreover the mortar which contains the greater quantity of lime will yield or settle more than that which has the greater proportion of sand.

All the walls of a building that are to sustain the same floors and the same roof should be carried on simultaneously; under no circumstances should more be done in one part than can be reached from the same scaffold, until all the walls are brought up to the same height, and the ends of the part first built should be racked back, as at a b, fig. 2, and not carried up vertically with merely the toothing necessary for the bond, as at a b, fig. 3.

Brick-work should never be carried on in frosty weather, nor even when it is likely that frost will occur before the walls can be covered in or become so dry as not to be affected by frost. Covering an unfinished wall with a thick layer of straw, when frost may supervene, is a very useful precaution; on the straw, weather boarding should be laid, to prevent access of moisture from rain or snow. Merely wet weather may be guarded against by following the directions given above as to flushing every course of the work well up with mortar, so that no interstices be left into which water may insinuate itself, and by covering the walls with boards to act as a coping when the men are not actually at work on them; the joints in the face of a wall that is not to be plastered in any way should be protected in this manner with great care.

In ordinary practice the bricklayer's scaffolds are carried up with the walls, and are made to rest on them. Having built up the walls as high as he can reach from the ground, he plants a row of poles, which vary in height from thirty to forty and even fifty feet, parallel to and at a distance of about four feet six inches from the walls, and from ten to twelve feet apart. To these, which are called standards, are attached by means of cords other poles called ledgers, horizontally and on the inside, with their upper surface on a level with the highest course of the wall yet laid; and on the ledgers and wall short transverse poles called putlogs or putlocks are laid as joists to carry the floor of scaffold boards. These putlocks are placed from four to six feet apart, according to the length and strength of the scaffold boards; and the ends which rest on the walls are carefully laid on the middle of a stretcher, so as to occupy the place of a header brick, which is inserted when the scaffolds are struck after the work is finished. On the floor of the scaffold thus formed the bricklayer stands, and the materials are brought to him by labourers, in hods, from the ground below, or they are hoisted up in baskets and buckets by means of a pulley wheel and fall. The

mortar is placed on ledged boards of about three feet square, placed Building. at convenient distances along the scaffold; and the bricks are strewn on the scaffold between the mortar boards, leaving a clear way against the wall for the bricklayers to move along unobstructedly. The workman then recommences the operation of bricklaying, beginning at the extreme left of his course, and advancing to the right until he reaches the angle or quoin in that direction, or the place where his fellow-workman on the same side may have begun. Thus he goes on with course after course until the wall is as high as he can conveniently reach from that scaffold, when another ledger is tied to the poles, another row of putlocks laid, and the boards are removed up to the new level. The ledger and most of the putlocks, however, remain to give steadiness to the temporary structure, and so on to the full height of the wall, piecing out the poles by additional lengths as may be required. If a scaffold be very much exposed, and run to a great height, it must be braced. This is done by tying poles diagonally across on the outside to the standards and ledgers, and it may be further secured by tying the ends of some of the putlocks to the ledgers; but an outside scaffold should never be attached in any way to the building about which it stands. A scaffold should never be loaded heavily, as well on account of the work as of the scaffold itself; for the putlocks resting, as they do, on single bricks, in a green wall, they exert an injurious influence on it, which every additional pound weight on the scaffold must necessarily increase. A constant and steady supply of bricks and mortar on the part of the labourers, without overloading the scaffold at any one time, should be strictly required.

Arches in brick-work are plain, rough, cut, or gauged. Plain arches are built of uncut bricks, and the bricks being parallelopipedons, an arch built of them must be made out with mortar; that is, the difference between the outer and inner periphery of the arch

requiring the parts of which an arch is made up to be wedge-formed, as ata, which the brick is not, the difference must be made in mor-

tar, as at b, so that the inner or lower angles of bricks used for this purpose should all but touch, and the mortar should be more consistent than that used in ordinary walling; nor should the centre on which an arch of this kind is set or built be struck or removed until the work is thoroughly hard, or rather all such arches should be set in cement which will harden immediately. In consequence of this inherent defect in uncut-brick arches, in extensive continuous works, such as sewers, tunnels, vaults, &c., it is advisable to make them in thin independent rings of half-brick or one brick thick, as the case may be; that is, a nine-inch arch should be in two half-brick arches, as at a, fig. 6, and an eighteen-inch arch in two one-bricks, as at b, each arch in the latter case being bonded in itself as in a common nine-inch wall with headers and stretchers. It is evident that, by this mode of structure, a greater quantity of the solid material comes into the back or outer ring or arch than into the lower one; and if they had been bonded together into one arch, as at c, all that difference must have been made up with mortar. Moreover, whatever pressure comes on the outer ring is carried by it directly to the inner or lower, from whose joints, however, the mortar cannot escape or be pressed out, the inner angles of the bricks, by meeting, preventing it below, and the bricks themselves of the upper arch, which conveys the pressure, are themselves opposed to the back of the same joints, so that its power of resistance is made equal to that of the bricks themselves, except at the ends; which, in such works as we have supposed, are remote, and may be protected by the use of cement in their joints, whilst mortar is used in the rest.

Rough arches are those in which the bricks are roughly cut with an axe to a wedge form, and are used over openings, such as doors and windows, when the work is to be plastered on the outside, or in plain back fronts, outhouses, garden-walls, &c., when, however, they are neatly pointed with what is called a tuck or tucked joint. Semicircular and elliptical arches are generally made plain, or without cutting the bricks; but arches composed of a smaller segment of a circle (vulgarly and technically called scheme arches), if not gauged, are cut or axed. Very flat arches are technically distinguished from the quicker segment, or scheme, by the term camber, from the French word cambrer, to round like an arch. It is arches of this kind which are generally employed over windows and doors in external work, and they too are either cut or gauged.

Gauged arches are composed of bricks which are cut and rubbed to gauges and moulds, so as to form perfectly fitting parts, as in masonry. Gauging is equally applicable to arches and to walling, as it means no more than the bringing every brick exactly to a certain form, by cutting and rubbing, or grinding it to a certain gauge or measure, so that it will exactly fit into its place, as in the finer works of masonry. Gauged brick-work is set in a putty instead of common mortar, but it is seldom used except for arches in the fronts of houses, &c., which are to be neatly finished. These

Building, are for the most part straight, and are generally from eleven to twelve inches in depth, or the height of four courses of brickwork. Their value as arches will be best understood by reference to the diagram, fig. 7, by which it appears that all the material between the soffit of the straight arch or head of the opening b c, and the dotted line b f c, is useless, the intrados or soffit of the really efficient part of the arch being at that dotted line itself. This is the arc of an angle of 60°; its chord, the width of the opening, being the base of an equilateral triangle constructed on it, and the joints are the radii of a circle whose centre is at a. b d and c e, the continuations of the sides of the triangle or radii a b and a c, are technically termed the skew-back of the arch. Sometimes the arc is made under a more acute angle, in which case the skew-back is less, that is, the external angles c b d, and b c e, are less obtuse; a smaller unavailable portion of the arch is thus left between the arc and its chord, but that portion is less securely retained under the flatter segment, because the joints or radii diverge less, or are more nearly parallel. These gauged arches being, as they for the most part are, but a half brick in thickness, and not being tied by a bond to anything behind them-for indeed almost the whole, if not the whole, of their height, is occupied behind by the reveal and the wooden lintel-require to be executed with great care and nicety. It is a common fault with workmen to rub the bricks thinner behind than before, to insure a very fine joint in front. This tends to make the work bow outwards; it should rather be inverted, if it be done at all, though the best work is that in which the bricks are gauged to exactly the same thickness throughout. Fig. 8 is a transverse section of fig. 7, and the gauged arch, lintel, &c., in it showing the total disconnection of the gauged arch with any surrounding brick-work to which it might be bonded. The absurdity of constructing arches circular on the plan, especially in a thin unbonded shell of bricks, is so clear as hardly to require notice.

Gauged facing to a wall is exceedingly objectionable, unless the bricks used for the gauged work be originally a little larger than those which are to be worked in behind, whose size should be their gauge, otherwise no bond can be kept between the bulk of the wall and its face; and the same mortar or putty should be used throughout, of equal consistence, and with joints of equal thickness, or the work cannot be sound and compact.

Everything relating to the construction of niches, groins, domes, &c., may be referred to the articles ARCH, BRIDGE, and STONE. MASONRY; the difference between stone and brick, as far as the principle is concerned, being only in the comparative magnitude of the parts; for to make perfect arches, &c., it is clear that the bricks must be cut to the same forms that are required in stone.

It is generally held that nothing but its own components should be admitted into a brick wall, except what is absolutely necessary for its connection with the other parts of a building, such as wall-plates and wood-bricks (and that these should be avoided as much as possible), templates, lintels, &c. Wall-plates are applied to receive the ends of the joists, and distribute the weight of the floor to which they belong equably along the walls. If the joists tailed singly on the naked bricks, their thin edges would crush those immediately under them, and the rest of the brick-work would escape immediate pressure altogether. Wall-plates may be avoided by the use of framed floors, which are carried by a few large beams, under whose ends stout pieces of timber two or three feet in length are placed. These are intended, like a wall-plate, to distribute the weight over a considerable part of the wall, and prevent the necessity of placing the beam on the naked friable bricks, and are called templates. Lintels are used over squareheaded windows and doors, instead of arches in brick-work. They are useful to preserve the square form and receive the joiner's fittings, but they should always have discharging arches over them, and should not tail into the wall at either end more than a few inches, that the discharging arch be not wider than is absolutely necessary. Fig. 9 indicates the elevation of the inside of part of an external wall with a window in it, and shows the lintel over the opening with a discharging arch over it, and wood bricks under its ends, on the jambs of the opening. Discharging arches should be turned over the ends of beams, and templates also, as in fig. 10. They may generally be quadrants of a circle, or even flatter, and should be turned in two or more half bricks over doors and windows, and other wide openings, but over the ends of beams they need not be in more than one half brick.

Wood bricks are used to prevent the necessity of driving wedges into the joints of brick-work to nail the joiner's work to. pieces of timber generally cut to the size and shape of a brick, and worked in as bricks in the inner face of a wall, where it is known the joiners have occasion for something of the kind. This is principally in the jambs of the windows and doors for their fittings, and along the walls, at proper heights, for the skirtings or wainscotting, as the case may be.

The use of bond timber in brick walls is objectionable, because

of its liability to shrink and swell, to decay, and to be consumed by Building, fire, in any of which cases the structure to which it belongs is either injured, endangered, or absolutely destroyed; and in England the use of timber in walls has, since the extension of the manufacture of iron in these countries, been in a great degree superseded by that metal in the form known as hoop iron. Thin and narrow strips of this metal are laid in the bed joints of mortar, at intervals more or less frequent according to the nature and character of the work, with the best effect in respect of compactness and consequent strength.

It will be generally found that a brick wall built with mortar and faced with ashlar has settled inward to a greater or less extent, as the work has been more or less carefully performed. Indeed in the nature of things it cannot be otherwise, unless the brick backing be worked in some cement which sets and hardens at once; for the outer face is composed of a layer of unyielding material, with few and very thin joints, which perhaps do not occupy a fiftieth part of its height, while the back is built up of an infinity of small parts, with fully one eighth its height of joints, which are composed of material that must both yield to pressure and shrink in drying. Some part of the ill effect attendant on this is obviated by the bondstones, which tail in or run through the wall, and tend to keep the discordant materials together; but still much of it remains: and besides this, the internal or cross walls, which have no stone in them, will either settle down and shrink away from the external walls, or drag them inward, as they happen to be well or ill bonded or tied. For these reasons, brick-work built in this manner with masonry should be executed with exceedingly well-tempered mortar, made with no more lime than is absolutely necessary to cement the particles of sand together, and the sand again to the bricks, worked as stiff as it can be, and laid in as thin courses as may be to answer the purpose required of it. Above all, work of this kind must not be hurried, but allowed time to dry and shrink as it goes on.

Discharging arches over vacuities having been disposed of incidentally, we have now only to speak of them under openings, in which situation their use is to distribute the superincumbent weight equally over the substructure, or along the foundation as the case may be. For this purpose the arch is inverted, as shown in the diagram, fig. 14, and by means of it the weight brought down by Plate the piers is carried along the footings, which are thus equally borne CXLVIII, upon throughout their whole length. Arches of two half bricks are indicated here, that being sufficient for ordinary purposes, and to develop the principle; in large and heavy works, arches of three half bricks, and even greater, may be judged necessary. Any arc between a quadrant and a semicircle may be used with advantage; but an arc of less than 45° cannot be recommended for the inverted discharging arch under piers. If it should so happen that an old well or cess-pool, that cannot without great inconvenience and expense be filled up with sound walling, or in some other efficient manner, the ground being sound on either side of it, a second discharging arch may be formed under the pier and over the unsound part, resting its legs on, or springing from, the inverted arch under the opening, and on the sound ground, as indicated by the dotted arch in the last-quoted diagram, fig. 14. For the most part, however, the bonding of the work may be trusted to carry the weight down to the ground under all but very wide openings very low down in the work. Arches require abutments whether they are erect or inverted, and this is often forgotten when inverted arches are used.

Not the least important part of the bricklayer's art is the formation of chimney and other flues. Great tact is required in gathering over properly above the fire-place, so as to conduct the smoke into the smaller flue, which itself requires to be built with great care and precision, that it be not of various capacity in different parts, in one place contracted to a narrow straight, and in another more widely expanded, and so on. With the present imperfect means of cleaning chimney flues, it is absolutely necessary that they be of a certain magnitude, which should be carefully maintained throughout; but it would be better that they were made oval, or with the angles taken off at least, than parallelograms in plan, as the practice is. Chimney flues are plastered or pargetted with a mortar in which a certain proportion of cow-dung is mixed, which prevents it from cracking and peeling off with the heat to which it is exposed. Experiment has proved that a tapering and nearly cylindrical flue of much smaller bore than is now required is the best for carrying away smoke. But the bore should be regulated by the size of the fire-place, or rather by the quantity of smoke to which it is required to give vent.

Sewers and drains which are not cylindrical should be built with concave bottoms, although the sides be parallel and the covering horizontal. The concave channel keeps the stream more together, and enables it the better to carry its impurities along with it: whereas a flat-bottomed drain offers a large surface for the particles of soil to attach themselves to, and the stream of water, being more scattered, is less efficient in force. All drains in houses and in other places where it may be necessary to open them at any time, should

Building. be of the form of which a, fig. 11, is a section, with a flat covering of stone paving, or large, strong, paving tiles, set and jointed with cement. Gun-barrel drains, as at b, are the best in exposed situations, because they are the strongest; but as there is no mode of cleaning but by breaking them up, if they are too long to be raked they should not be employed except with a considerable fall, and a frequent or constant stream of water through them, as from a pump trough, rain-water trunks, &c. They are constructed on a barrelled centre, which the bricklayer drags on as he advances with his work, finishing as he goes. Large sewers, which are accessible from the ends by men to clear or remove any accidental obstructions, are best circular or elliptical; the latter of the two is generally preferred, because, in proportion to its capacity, its height is greater. No drain should have an inclination or fall of less than one-quarter of an inch to a foot; and where the stream is infrequent and dull, as much more would be a great advantage. In building drains it is of great importance that proper traps should be constructed to prevent the return of foul air and the passage of vermin. At every sink there should be a bell-trap, and a well-trap within that, or near the hither end of the drain. Suppose a drain of the form of that shown at a, fig. 11, nine inches wide and nine inches deep, leading from a kitchen or scullery to the common drain of the house, in which it meets that which comes from the water-closet and other places. The belltrap in the sink itself will prevent the return of smell when it is constantly in use, but it is liable to be broken and otherwise injured by the ignorance and impatience of servants and others, or it may become dry by evaporation in some situations; it is therefore necessary to have a trap not so liable to contingencies. Let a well be made eighteen inches or two feet in diameter, square or round, and two feet six inches or three feet deep, across and below the level of the drain, as shown in the plan, fig. 12, and longitudinal section of the same, fig. 13; it must be built around with brick, in cement, and be plastered on the inside with the same material, which will make it capable of retaining fluids. Uprightly across this well, and in the transverse direction of the drain, must be placed a sound piece of paving stone, so long that its ends may be inserted in the sides of the well, as shown in fig. 12, and so wide that its upper edge shall touch the covering of the drain, and that its lower may reach six or nine inches down into the well below the bottom of the drain. Mortar or cement must prevent the passage of air between the upper edge of this trap-stone and the cover of the well and drain, and the trap is complete. The water coming from the sink flows along the drain from a to b (fig. 13), where it falls into the well, and filling it up to that level, it flows on again from c in the direction of d, to the cess-pool or common sewer, from which, however, no smell can return; for the trap-stone e, the lower half of which is thus immersed in water, completely bars the passage. It is evident, however, that if the well should leak, the water in it may fall below the lower edge of the stone, and the efficiency of the trap be destroyed; but if it be made perfect in the first instance, there can be no danger of any inconvenience that a bucket of water thrown in at the sink will not cure. It is from the drying up of the water in these well-traps (vulgarly called stink traps) that uninhabited houses are so frequently offensive. It must be clear, moreover, that these traps form an effectual bar to vermin, and they may therefore be advantageously placed at the entrance of water-closet drains, to prevent rats from getting at the soil-pipes, which they will gnaw and destroy if they can get access to them. Internal drains, or those which go through a house, should always pass under the doorways if possible, in external walls at least. If, however, circumstances should render it absolutely necessary to take a drain through a wall, an arched ring or bull's eye should be made for it to pass by.

Cess-pools should be made cylindrical, and be bricked round, but whether they are made to retain fluids or not, can seldom be a matter of consequence, as they are generally put in secluded places, where, if the object be not to get rid of the waste, there is seldom, at least, any desire to retain it. In towns and cities where the common sewering is as complete as it ought to be, and waterclosets are used instead of privies, cess-pools are unnecessary, as the soil becomes so much diluted by the water that goes down with it, that it flows readily enough through the private drains to the common sewer, and so on with the rest, to the common receptacle. Sometimes, indeed, it may be found necessary to clean out the welltraps, but this cannot often occur.

Pipes being hollow cylinders of well-made and well-burnt pottery form the most efficient house-drains. Such pipes may be put together end to end, with great accuracy and sufficient strength, with the aid of collars of the slightest sheet-iron looped together as hoops. The common and bad practice is to form such pipes with sockets, so as to fit spigot and faucet fashion; but the addition to the substance of the pipe to form the socket almost insures a defect in the pipe in or about the socket, whilst the kind of connection which the socket establishes renders it impossible to take out any one length of pipe, and thereby to open a drain in the event of an

obstruction occurring without disturbing many lengths, and makes Building. perfect re-instatement impossible, without taking up and relaying the drain from one or other of its ends. All this is precluded by the use of a collar, but the collar used must not be of the brittle pottery itself. In using pipes for drains, it should be borne in mind that a little larger than large enough, is better than the reverse of this. No pipes should be laid down for a house-drain of less bore than six inches, nor should pottery be used for drains requiring a greater bore than twelve inches; the material is too weak to allow of more. Nor should pottery drain-pipes be laid under any carriage road, for the same reason, that the material is not strong enough to stand more than a dead pressure.

Brick and tile paving is performed by the bricklayer. Brickpaving is either flat or on edge, in sand or in mortar or cement. Brick flat-paving in sand, that is, with the bricks laid on their broadest surfaces, and bedded in and on dry sand, is very slight and fragile, and brick flat-paving set and bedded in mortar is very little better; for if the soil on which the paving is laid be light and sandy, the bricks are easily displaced by being pressed unequally; and if it be clayey it will probably be moist, and the thin porous brick absorbing the moisture, will generally become saturated, and present a damp, unwholesome floor. Paving with bricks on their edges, however, forms a much better floor, and is preferable to a stone paving, if the latter be laid on the ground without the intervention of footings. Brick-on-edge paving in sand is generally used in beer cellars, pantries, dairies, stables, &c., as its numerous open joints allow wasted or discharged fluids readily to escape; and it is both cool and dry under ordinary circumstances. In mortar or cement, bricks on their edges form a sound, dry floor: the smallness of the surface exposed by each brick in this manner leaves them of course less susceptible of partial pressures, and the depth from the soil to the surface is such that damp rarely shows through. The paving brick differs from the common brick only in thickness, its dimension in that direction being rather less than two inches. instead of two inches and a half, and in being rather harder and more compact. Dutch clinkers are paving bricks, smaller and much harder than the English; they are six inches long, three inches wide, and one inch and a half thick, and are always set on edge and herring-boned; that is, instead of being placed in parallel lines, they are set at right angles to each

other thus,-with nevertheless a perfectly even face. Paving tiles are made nine inches and a half and eleven inches and a half square, though they are called teninch and twelve-inch or foot tiles respec-

tively, the former being one inch, and the latter one inch and a half thick; they are set in courses, as stone paving would be, the alternating courses breaking joint.

Tiling being much less in vogue than formerly, in consequence of the better appreciation of the superior qualities of slate for covering roofs, and the moderate cost at which slates are now furnished to the builder, it no longer maintains its separate artificer, but is performed, when it is required, by the bricklayer. It consists, for the most part, of two sorts—plain tiling and pan tiling. Plain tiles are simple parallelograms, generally about ten inches and a half in length, six inches wide, and five-eighths of an inch thick; and each tile has a hole pierced through it near one end, to receive the wooden pin by which it is hooked on to the lath. The tiles are laid in mortar on the laths, which in this country are of oak or fir, with an overlap of six, seven, or eight inches. The greatest overlap or smallest gauge makes the securest work, though it does not present so good an appearance externally as a longer gauge does; and it requires, moreover, a greater number of tiles and laths, thereby adding materially both to the weight and the cost. The great overlap and the mortar are both necessary, nevertheless, to prevent the rain and snow from driving in between and under the tiles. Plain tiling requires the pitch of the roof to be at an angle of at least 50°, and is one of the heaviest coverings that can be used, though it is at the same time one of the warmest. The tiles, however, readily and rapidly absorb moisture, which they communicate to the laths and rafters under them, to the serious injury of both the latter; and the mortar in which they are set requires to be frequently pointed, the constant atmospheric changes to which it is exposed occasioning it to crumble and fall away in no long time.

Pan tiles are parallelograms of irregular surface, straight in the direction of their length, which is thirteen inches and a half, but twisted to this form and in the transverse section. Measuring the whole surface across, a tile is nine inches wide, but in a right line from point to point not more than seven, and its thickness is half an inch; a small tongue or lip is bent down at one end from its flatter convexity, on the under side, to hook it on to the lath by, instead of a wooden pin through it, as in a plain tille. Pan tiles are set dry or in mortar, on laths. They are not laid side by side, but overlapping laterally thus; consequently all the overlap

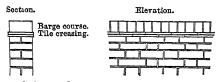

Building. they have longitudinally is three or four inches only, or enough to prevent rain and snow from driving up under the upper, over the end of the lower tile; and thence pan tiling is but little more than

half the weight of plain tiling. It is nevertheless a much less warm covering for houses, and is more liable to be injured by violent gales or gusts of wind than the latter is; but again, it presents a far more pleasing appearance to the eye. Pan tiling will not bear a much flatter pitch than the other, but it is greatly improved by being pointed on the inside with lime and

hair. Sometimes indeed the whole of the work is, as we have said, set in mortar; but this mode has disadvantages to which pointing internally is not liable, and its superiority in other respects is questionable. To both pan and plain tiling there is a large concave tile used to cover the hips and ridges of a roof. These are not generally made to overlap each other in any situation, but are set in mortar, and fastened with nails and hooks fitted for the purpose, and driven into the wood-work of the roof.

When the top of a brick wall is not protected by a roof, it must be covered or coped in some manner, or it will soon be destroyed by the weather. Sometimes this is done by means of a course of bricks set across it on their edges in cement, and called a barge course, but it is a very imperfect covering, for water will trickle down the face of the wall on both sides, as the coping brick can be no longer than the thinnest wall is in thickness. Two double courses of plain tiles may be put side by side under the barge course, making a projection over either face of about one inch and a half: thus,-

This is much better than the barge course alone: but still the covering receives no inclination outwards to throw the water off; the upper surfaces are all horizontal. The same objection exists to foot-paving tiles, which are also used as a coping; but none of these methods is available for any wall above nine inches in thickness. Stone coping, therefore, which may be made of sufficient width, and be both weathered and throated, is much to be preferred.

One of the greatest faults in the modern practice of building, both architecturally as a matter of taste, and practically as a matter of prudence, is, that these copings, and cornices which serve as such, do not project sufficiently to protect the face of the wall on which they may be placed, from the weather. A bold, massive, and well-projected cornice on a wall serves as a roof or pent-house to it, and, besides imparting great beauty to the plainest structure, protects the wall from the premature decay of its upper part especially, and of the joints generally, if it be unplastered brick-work, which thereby calls for the frequent repetition of pointing. Effective and pleasing cornices and blocking courses may be formed with uncut bricks alone; and these, set in cement, would, with judicious management, add materially both to the appearance and durability of brick-work, without the foreign aid of either the plasterer or the

From the injury which accrues to the joints of brick-work through bad management in its execution, and imperfect protection when executed, arises the necessity so frequent at the present day of pointing.

Sometimes frost will have supervened before the surfaces of the joints in a wall are dry; consequently the mortar bursts and peels away, and the whole then requires to be pointed. Preparatory to this operation the scaffold, if it has been struck, must be re-erected. the mortar raked out of the joints to a depth of about three-eighths of an inch, or deeper if the injury have reached further; -this can be done by a labourer; - a bricklayer then goes over the whole with a hard hair brush and water to cleanse and moisten the joints; and then, with mortar prepared for the purpose, he carefully fills them all up, and neatly draws them with his trowel. This mortar must be of the best quality; it is generally compounded with a certain proportion of forge ashes, which gives it a blue tinge, and greatly aids its power of resisting the action of the weather. Cement is sometimes used instead of this blue mortar. If the wall to be pointed be a front or other important one, in which peculiar neatness is required, every joint is marked with a narrow parallel ridge of a fine white putty, in the composition of which bone lime

forms a principal ingredient. The former is called flat-joint, and

the latter tuck-pointing. If it be an old wall that requires point-

ing, a scaffold must be erected before it; and where the putlocks

cannot be rested on window-sills and the like, half bricks are generally drawn from the wall to make rests for them, and restored again when the work is done. The former process is then gone through with a common wall; but if it require tuck-pointing, the whole surface is well washed, and then coloured, to look like new, before the pointing is done. The gauged arches over the windows and doors are always coloured, and the joints drawn with peculiar neatness. If in the original building of the wall the perpends have not been preserved, that is, if the vertical joints have not been made to fall perpendicularly in the alternately recurring courses, the workman in pointing stops up the old joints, which are irregular, with putty of a brick colour, and forms false new ones in the proper places.

Building.

The tools and implements mostly employed by the bricklayer are the trowel, the plumb-rule, the level, the square, the bevel, linepins and lines, the raker, and the hammer, together with a hod and spade for his labourer. Besides these there are sundry others used in cutting and gauging bricks and some which are peculiar to tiling and paving; but the most material operations can be performed with those enumerated here. A pug-mill and screens for mixing and tempering mortar are also auxiliaries of great importance.

Brick-work is valued by the rod. A rod of brick-work is a quantity whose superficies is 2724 feet (taken in practice at the round number 272 without the fraction), and thickness one brick and a half. Reckoning the one brick and a half at thirteen inches and a half,-its average extent,-the cubic foot is to the reduced superficial foot as eight to nine, so that a cubic rod of brick-work consists of 306 feet, the result of 272 multiplied by nine and divided by eight. The reduced superficial rod, however, is that commonly used in practice; and the process of measuring, to ascertain the quantities and bring them to a standard, is as follows :-

The exact superficies of so much of a wall as may be of the same thickness is taken, and the number of bricks it is in thickness placed marginally; all the different portions or parts being of the same thickness are taken in like manner, and then deductions, as of window openings and doorways, are taken as such, in superficies, with their respective thicknesses placed marginally also. mensions, on being squared, are abstracted it half bricks, the deductions made of like thicknesses from like thicknesses, and the whole reduced by multiplying each quantity by the number of half bricks in the thickness of the parts of the wall which the margin expresses, and dividing the product by three (the number of half bricks in one brick and a half, the standard), the reduced quantity which results, divided again by 272, the number of feet in a rod, gives the quantity of rods and feet in the wall; as, for example,-The front wall of a house is thirty-five feet in length on the ground floor. (Fig. 14.) It has a basement story twelve feet high from the top of the footings to the level of the ground floor, and two and a half bricks thick, which is a half brick more than the wall above. The footings are three spreading courses high, each course a half brick thicker than the one above it. In the basement wall there are a door and two windows, the former seven feet by three feet six inches between the reveals, and the latter five feet by three feet nine inches between the reveals also. The measurement of thus much will show how all the rest must be done.

The footings consisting of three equally spreading courses, the extent of the middle one both in length and breadth will be an average of them all, so that they may be taken in one height. To the length of the ground floor, thirty-five feet, must be added twice three sets-off of one-fourth of a brick at each end of the basement, and of the two first courses of footings for the length of the second of them; this is equal to three half bricks, or thirteen and a half inches, which, added to thirty-five feet, makes thirty-six feet one and a half inch the dimension of length for the footings, by nine inches, their height; their average thickness, to be placed in the margin, is three and a half bricks, the highest course being three bricks, the second three and a half, and the third or lowest tour bricks. That is the first quantity. The next is of the wall above. The length (onehalf brick, for the two sets-off, added to thirty-five feet, gives) thirtyfive feet four and a half inches, by the height twelve feet, two and a half bricks thick. The deductions are seven feet by three feet six inches in one brick for the door, between the reveals, and seven feet four and a half inches by four feet three inches in one and a half brick behind the reveals, the rest of the thickness of the wall, an addition of one-half brick being made to the height, and of two half bricks to the width, because of the reveals. The windows are taken in exactly the same manner, with the same additions; but as the two are of the same size, their number is marked against the one dimension. The dimensions are now to be squared, and the squaring is done by duodecimals, or cross-multiplication. 36 feet 11 inches  $\times$  9 inches = 27 feet 1 inch; 35 feet  $4\frac{1}{2}$  inches  $\times$  12 feet is = 424 feet 6 inches, and so on with the rest. An abstract is then made of these quantities in two columns, the first is marked "onehalf brick," and the second "deductions in that thickness." In the

Building. first column is placed the first quantity, multiplied by seven, the number of half bricks in three and a half, which stands marginally

to it; 24 feet 6 inches  $\times$  7 = 189 feet 7 inches. The second dimension follows in the same column, multiplied by five, the number of half bricks in its thickness; the next quantity is a deduction, that is placed in the second column, multiplied by two, the thickness of the part deducted being one brick, and the rest in the same manner. The abstract being completed, the columns are added, and the amount of the second deducted from that of the first, and the difference divided by three, which brings it to the reduced standard. Dividing now by 272, the number of rods and feet in the given wall appears to be 2 rods, 185 feet, 8 inches. The quantities are more generally abstracted in one-brick and one and a half brick columns, with deductions in other parallel columns, to which thicknesses they are all readily brought. The single column in one-half brick is, however, assumed here as the more simple and the more easily explained.

It must be remembered, that in taking the return or end walls,

Basement wall from the top of footings to the level of ground floor. Deduct for door 24 6 between the reveals.

Footings.

the thickness of that which has been already taken in front is to be deducted from their length, or the angle-pier or quoin will be taken twice. Work which is circular on the plan may be taken separately, and charged at a higher price altogether, or it may be measured as plain, and an extra taken at so much the superficial foot. Chimney breasts are taken as additional quantities, with the thicknesses they project, and the opening for the fire-place is deducted; but the flues are measured as solid, the extra labour and mortar in forming and pargetting them being fully equal in value to the bricks saved.

A rod of brick-work will consume about 4500 bricks, though the number will be a few more or less than this, as the bricks happen to be below or above the average size, and as the joints are made thicker or thinner. The quantity of mortar, it is evident, will be affected by the latter consideration also; but in London it is generally reckoned at from ninety to a hundred striked bushels, or from four to four and a half cart loads, each containing about one cubic yard, to the rod. The labour on a rod of brick-work may be taken on an average at the wages of a bricklayer, and his assistant or labourer, for four days; this, however, does not include making and turning the mortar, nor scaffolding, which latter must be separately considered. Many things will, however, affect the time in which the work may be performed, both of the bricklayer and his labourer; the former can do one-fourth as much more, at the least, in walls which are to be plastered, as in those in which he has to keep the perpends and draw the joints, &c., and more in thick walls than in thin ones; and the capability of the latter will depend, inversely, on the rate at which the former can proceed, on the distance he may have to carry the bricks and mortar to the foot of the ladder, and mainly on the height he has to carry the materials up the ladder. In great heights, however, the materials should always be hoisted.

Gauged arches are taken at so much per foot superficial, in addition to being measured in as brick-work. Both the vertical and horizontal surfaces are measured to obtain the superficies of the arch, or rather of the work upon it. Rough arches are also taken as an extra superficial quantity; but plain arches in vaults, &c. and discharging arches, are not considered extras, though an allowance is made for cutting to moulds, for inverted discharging arches, at per

If a wall be faced with bricks of a more costly sort than that of which the bulk is composed, or worked in a peculiar manner, it is calculated by the foot superficial, also in addition to its measurement as brick-work. It should be a matter of previous agreement whether or not there shall be an extra charge for plumbing quoins and reveals. Under ordinary circumstances no allowance is made for it; but oblique vertical angles, both internal and external, which require to have bricks neatly cut to form them, are taken at so much per foot running measure. External oblique angles are technically termed squint-quoins, and internal, birds-mouth. Oblique

angles within a building are taken as run of cut splay. Cuttings Building. to rakes or inclined straight lines are taken by the running foot also, but with reference to the thickness of the wall. Cuttings to ramps or concave lines are measured and valued in the same manner. Sailing or projecting courses, preparations for plaster cornices and brick cornices themselves, are all taken at so much per foot run, according to the labour and materials involved in working them, over and above the regular charge for the brick-work by the rod.

Everything, indeed, which adds to the labour of executing brickwork, and consumes more than the ordinary quantity of materials, is taken in addition, either by the foot superficial, or by the foot running, or in numbers, as the setting of chimney-pots, bedding and pointing door and sash-frames, &c. Bond-timbers, lintels, and wallplates, are generally measured in with the brick-work, on account of the trouble of bedding them, and the delay generally occasioned to the bricklayer in setting them. If they are not included with the brick-work, bedding them is an extra charge, at so much per foot run; and then filling in between the ends of the joists and beams generally requires to be taken also.

Brick-nogging is measured by the superficial yard, including the quarterings and interstices, and making no deductions but for openings. Drains and sewers are measured by the foot run, according to their form and capacity. The quantity of materials consumed, and labour required in constructing them, may be readily obtained by calculating the one, and observing the quantity a man with a labourer can execute under the circumstances, whatever they may be, within a given time. Digging out the ground, filling in over, and the removing of the spoil, necessarily cause an addition to the charge for the drain, which must vary according to circumstances.

Paving is measured by the superficial yard of nine feet; tiling by the square of one hundred feet; -eaves courses, ridges, and hips, being extra charges, by the foot run. Pointing, whether to old or new work, is measured by the superficial foot; and the scaffolding for it, when scaffolding is required, is either included in the price per foot for pointing, or a charge is made for the use of it, together with the cost of carting, and the men's time in setting up and removing it.

Mason.—We must refer to the separate articles under STONE-MASONRY for information on that subject. It will, however, be necessary to give a few particulars here on masons' work, as it has to do with other artificers' works in the process of building, and especially with reference to various species of walling, or modes of constructing walls of

From the regular and determined form of bricks, modes or systems for setting or arranging them may be formed, and any workman, by habit and an exertion of memory merely, may become competent to build a brick wall as well as it can be built; but it is not so with stone used in common masonry The workman in this material has for the most walling. part to deal with masses of all forms and of all sizes, and a continual exercise of the judgment is required from him beyond the tact or skill which may be acquired by practice. For this reason workmen are generally less to be trusted to themselves, or to their own discretion, in stone than even in bricklaying or walling. The best or highest sort of stone walling is the easiest to set; it is that in which the stones are all tooled and gauged in regular parallelogramic figures, to range in courses and suit the thickness of the wall to which they are to belong; and the most difficult to execute properly is that in which amorphous stones are used,—the mason being allowed merely to dress them roughly with his hammer or axe, and fit them in as he best can to form the most compact mass: this is called rubble walling.

From the brittle nature of stone, great tact is required in setting, to prop or bear up the longer pieces in every part, or they will break across, and thus occasion more injury than could accrue if their whole mass had been made up of small Very long lengths, therefore, should be avoided, even in regular tooled courses, with which the bearing is or should be perfectly even, and a settling down of the work itself is hardly to be feared. There is a certain medium which may be preserved; and although the object is obviously, in stone as in brick walls, to form a compact mass, as unbroken into parts as possible, a mason will act judiciously in breaking a very long stone into two or more shorter ones,

Building, and working them in that state, though he thus makes two or more additional joints, well knowing that he has the power of counteracting to a certain extent the ill effect of joints made by himself, but that those made by accident are irremediable.

The observations made in the section of this article on bricklaying, on the use of mortar, will apply here also. Of whatever quality the stone may be of which a wall is to be built, it should consist as much of stone and as little of mortar as possible. If it be inferior in durability and power of resisting the action of the atmosphere, &c. to the mortar, besides the certain fact that the mortar will yield until it has set hard, and so far act injuriously, no ulterior good is gained; and if the stone be the more durable material, the more of it that enters into the wall the better. Indeed, in rough walling, if the stones be pressed together until the more prominent angles on their faces come into actual contact, the interstices being occupied by mortar, it will be better than if a thick yielding mass were allowed to remain between them. Absolute contact, however, should not be permitted, any more than in brick-work, lest the shrinking of the mortar in drying leave the stones to such unequal bearing as the prominent parts alone would afford. Stone being generally of a less absorbent nature than brick, it is not a matter of so much importance that it be wetted before setting; nevertheless, adhesion on the part of the mortar is more certain and more complete if the stones be worked in at least a damp state. What bond is, and the necessity for it, have also been shown in the preceding section; and bond is of not less importance in stone walling than in bricklaying. have also hinted above at the greater difficulty of understanding, forming, and preserving it in the former, and can now only add a few observations in addition that can be of any use, and these with reference to rubble walling particularly. Instead of carefully making the joints recur one over the other in alternate courses, as with bricks and gauged stones, the joints should as carefully be made to lock, so as to give the strength of two or three courses or layers between a joint in one course, and one that may occur vertically over it in another. In bonding through a wall, or transversely, it is much better that many stones should reach two-thirds across, alternately from the opposite sides, than that there should be a few thorough stones, or stones extending the whole thickness of the wall. Indeed, one of the many faults of stone-masons is that of making a wall consist of two scales or thin sides, with thorough stones now and then laid across to bind them together, the core being made up of mortar and small rubble merely. This is a mode of structure that should be carefully guarded against. There is no better test of a workman's tact and judgment in rubble walling than the building of a dry wall, or wall without mortar, affords; -walls are frequently built with mortar that without it would have fallen down under their own weight in a height of six feet, in consequence of their defective construction;—thus rendering it evident that they are only held together by the tenacity of the mortar, which is very seldom an equivalent for a proper bond of stone. Masons are very apt to set thin broad stones on their narrow edges to show a good face, by which the wall is injured in two ways; it tends to the formation of a mere case on the surface of a wall, and it for the most part exposes the bed of the stone to the atmosphere, as a stone is more likely to be broad in the direction of its bed than across it.

Rubble walling is either coursed or uncoursed. In the latter sort, fig. 15, the work is carried on with stones of any sizes, as they may occur, and without reference to their heights, somewhat in the manner of the Cyclopean walling of antiquity; the interstices of the larger being filled up with smaller stones. For this work the mason uses no tool but the trowel to lay on the mortar, the scabling hammer to break off the most repulsive irregularities from the stones,

and the plumb-rule to keep his work perpendicular. The Building. line and level are equally unnecessary, as the work is independent of considerations which are affected by them. An attentive and intelligent workman will, however, make a sound wall with this species of construction, by fitting the stones well together and packing them with as little mortar as possible, yet filling every crevice with it, and carefully bonding through to secure compactness, transversely at the

In coursed rubble walling, fig. 16, the line and level are used, the work is laid in courses, each course being carefully brought up to the same level in itself, though no attention is paid to uniformity in the heights of the different courses. For this species of walling the stones are generally roughly dressed by the workman in the gross before he begins building. He is careful to get parallel beds to them, and he brings the best face of each stone to a tolerably even surface at right angles to the beds; the ends, too, receive some little attention, and for this purpose he uses an axe in addition to his scabling hammer. The quoins in coursed rubble walling are generally built with peculiar neatness and precision, and they are set to serve as gauge courses for the rest. This, when well executed, makes a sound and excellent wall. It presents, however, rather a rough and homely appearance, and in finer works must be covered with stucco or cement, or faced with ashlar.

Ashlar is an external rind of gauged stones in equal courses, having tooled or closely-fitting joints to give a wall a neat and uniform appearance; it is axed, tooled, or rubbed, as may be thought most in character with the structure, or that part of it to which it is to belong. Ashlar stones, or ashlars as they are commonly called, are made of various sizes on the surface, as the character of the edifice may require or convenience demand, and vary in thickness from five to eight or nine inches. Some of the ashlar stones must, it is clear, be used transversely as bond stones, or the facing, having nothing to connect it with the wall behind, would soon totter and fall. Bond stones are generally put in alternate courses, with the backing to the jambs of openings, such as windows, and oftener, if these do not recur within a length of five or six feet; the bond stones themselves, too, should not fall in the same vertical chain, except when they are in the jambs of openings, but break in their alternate courses. Ashlar is commonly set in a fine mortar or in putty. It is generally recommended that ashlars should not be made regular parallelopipedons, but run back irregularly to tooth in with the backing, the vertical joints being left open from about an inch within the face of the wall, and the upper surface or bed of the stones made narrower than, though perfectly parallel to, the lower. These things may exert a slightly beneficial influence under some circumstances; but the mode of construction involved is so radically bad, that unless the backing is set in a quick-setting cement, or be so well packed as to be proof against its general tendency to settle away from the ashlar facing, no means of the kind can materially improve it. A well-compacted wall of coursed rubble, the courses being frequently made up of whole stones and faced with ashlar, may be made tolerably sound and trustworthy. Brick backing, with ashlar facing, cannot be considered as good, though it has the advantage of not requiring battening and lathing for inside plastering, as the stone-backed wall does. Uncoursed rubble with ashlar has all the disadvantages of both the preceding, with nothing to recommend it before either of them.

There are, besides, many sorts of walling or modes of structure arising from the nature of the materials furnished in various localities. That of most frequent occurrence, perhaps, is a manner in which either broken or rounded flints are used. These depend almost entirely on the mortar with which they are compacted, and on a coursed chain, which is commonly introduced at short intervals of larger Building. stones or of bricks, to act as a bond; the quoins, too, in this species of structure are generally constructed of dressed stones or of brick.

wall by pressing unequally, and their own seat be also en-Building. String courses (vide ut sup.) economically, in contradistinction to architecturally, are meant to protect a

Whatever objections lie against bond timber in brick-work apply with equal force at least to the use of it in stone walls. Hoop-iron bond is not only available in all kinds of stone walling, including the highly-wrought close-jointed kind, but it is invaluable, as it may be used both longitudinally and transversely as it may in brick-work; whilst it compels the building mason to bring his work up to a true and fair bed as often as the bond is to be laid in it.

Discharging arches, it must be evident, are as necessary in and to stone walls as to walls of brick, and they may be treated much in the same manner.

Rubble walls are scaffolded with single, and ashlar-fronted or other gauged stone walls with double-fronted scaffolding, the former tailing one end of the putlocks in on the wall, and the other having an inner row of standard poles and ledgers parallel to the outer, making the scaffold entirely independent of the wall. In some places, however, it is the custom to dispense altogether with an external scaffold in building stone walls, particularly with gauged stones. With light and plain work this may be done without much inconvenience or retardation; but if the work be heavy or delicate, considerable delay and incorrectness result. Sometimes the finer work, such as that to mouldings, flutes, and foliate or other enrichments, is merely boasted or roughed out before the stones are set, and finished afterwards. This can be done well only from a secure floor or scaffold, on which the workman may move freely.

When walls are not entirely of masonry, in the ordinary course of economic building, stone is frequently used for copings, cornices, string and blocking courses, sills, landings, pavings, curbs, steps, stairs, hearth-stones and slabs, and chimney-pieces; to these may be added quoins and architectural decorations, or dressings for windows, doors, &c., though both the former and latter are not unfrequently executed in plaster composition, or cements. Copings (see Glossary to the article Architecture) to cover walls, parapets, &c., are worked with a plain horizontal bed, two vertical faces, and an inclined or weathered back or upper surface; either forming an acute angle with the outer and wider, and an obtuse angle with the inner and narrower face, to throw the water off, as shown at a, fig. 19; or to both sides from the middle, as at b; the latter is technically termed saddle-back coping. In both cases they are made to project over the wall or parapet on both sides; and in the projected part of the bed under the edge or edges towards which the inclination is given, a channel or groove, called a throat, is cut, to intercept the water in its inclination to run inwards to the wall. On gables or other inclined planes the coping is neither weathered nor throated, as the water is necessarily impelled along its course to the lower end, and not over the sides. To protect the separate stones of a coping course from the danger of being displaced by high winds or other accidental cause, and to form a chain through its whole length, the stones are linked together by cramps of copper or iron let into their backs and run with lead. These metals, however, especially the iron, for the most part act very injuriously, from their exceeding susceptibility of atmospheric changes, and their greater or less tendency to oxidation; indeed, the stone invariably suffers more than the work benefits from the metal cramps. Tenons, dowels, joggles or dovetails of stone, or of hard wood or cast iron, applied so as to be protected from the weather, would be far better, and would answer every desirable purpose sufficiently. Cornices (vide ut sup.) are but ramified copings, and are or may be subjected to the same general laws. Care must be taken, however, in arranging them, that their centre of gravity be not brought too far forward, in the anxiety to project them sufficiently, lest they act injuriously on the

dangered. String courses (vide ut sup.) economically, in ' contradistinction to architecturally, are meant to protect a set-off in a wall, by projecting over its lower face in the manner of a coping (see fig. 17, at c); the beds are worked parallel, and the outer face vertical or at right angles to them, but so much of the upper surface is weathered or sloped off as protrudes from the upper part of the wall to carry the water off; and, for the reason above stated with regard to copings, the lower bed just within the outer face is throated. A stone string course, cramped or dovetailed in the bed, forms an excellent chain round a brick-wall; but the part of it in the wall should be of the exact thickness of one, two, or more courses of brick-work. A blocking course (vide ut sup.) is either a very thick string projecting over or flush with the face of the lower part of the wall to cover a setoff, or it is a range of stone over a crowning cornice to bring the centre of gravity more in on the wall than it otherwise would be; in the former case it is treated exactly as a string, excepting that, if it be flush below, there is no occasion for a throat; and in the latter it has a horizontal bed, parallel vertical sides, and a weathered back or upper surface. Sills (vide ut sup.) are weathered and throated like the parts of a string course (see fig. 17, at a-and b); they are laid across window openings as a base to the sash-frame; distinct sills in the same line may, indeed, be considered as an intercepted string course. In the ordinary practice of building, window sills are seldom set in brick walls until they are absolutely required to set the sash-frames on; or they are set but not bedded, except at the ends. The object of this is to prevent any settlement that may occur in the piers from breaking the sills across on the unyielding part of the wall under the windows. A necessity for this, however, can only arise from bad construction; for with a good bond in the brick-work, all would settle together, and the sills might be completely bedded across at once. Landings are platforms of stone, either over an area before a door, at the head of a flight of stairs, or as the floor of a balcony. They are made four, five, six, or eight inches in thickness, according to their extent and bearing; if not of one piece of stone, they are of nicely jointed pieces joggled and plugged together, and are worked on the face and edges just as their situation may demand. Stone pavings are of various kinds, and are prepared, shaped, and laid in various ways. Stone paving that is not exposed to the sun and air, if next the ground, should be laid on footings of brick or stone, or it will be constantly damp if the soil be close and clayey; but in yards, open areas, &c., it may be laid on the ground, bedded in sand, and jointed with mortar or cement. Stonepaved floors are either on brick arches, or on a timber floor prepared for the purpose; the latter is a very bad mode of supporting paving, as the impression derived from the presence of the stone is, that the floor is incombustible; but if it be bedded on combustible material, the danger to human life in the event of fire is greater than if the stone paving did not exist at all. It is worked, cut, and set more or less expensively, according to circumstances. A curb is a range or course of thicker and stronger stone to bound a pavement, and is either flush with the paving, showing as a step on its outer edge, or raised above it to receive a balustrade, and shows on the outer side as a blocking course; in the latter situation it is generally joggled and plugged in the joints. The term step or steps alone is generally understood to mean external steps, whether arranged in long or short flights, or the single step in a doorway into which the door-frame is tenoned. A step should have a plain horizontal bed, and a very slightly weathered tread or upper surface; the front or riser worked plain and vertical, or with a moulded nosing, and the back sunk with a joggle or bird's-mouth joint to receive the step or landing above or behind it. Stairs are but a flight or combination of steps

Building. used internally; the principles upon which they are constructed will be found under the heads Stone-Masonry and JOINERY. Hearths are the stone-flooring of fire-places; and a slab is that part of the floor of a room which lies immediately before the fire-place and along the extent of its front. This slab is supported by a flat brick arch called a brick trimmer, which is turned from the chimney-breast under the hearth on one side, to the trimmer joist on the other. (See a section of all these at fig. 18.) Chimneypieces consist simply of mantle and jambs; that is, the vertical sides, and the architrave or transverse covering with its shelf or cornice. The parts of a chimney-piece are generally put together with an adhesive plaster or cement, and affixed to the wall or chimney-breast behind with cramps, holdfasts, and plugs. The material of which chimney-pieces are composed varies from the coarsest stone to the finest marble; and the labour on them varies to a still greater extent. Quoin-stones are gauged and wrought blocks with parallel beds and vertical faces, placed on the angles of buildings with the intention of adding to their beauty and strength; they are used either with brick or stone walls, and are generally made to project before the face of that to which they are attached, mostly with a weathered angular joint, or with a rectangularly grooved or moulded one. The quoins are coursed with the rest of the wall if it be of stone, and are made to occupy the exact space of a limited number of courses of brick in a brick wall. (See fig. 17.)

Masonry to receive architectural decorations is generally worked into the walls as they are carried up; but as they are seldom homogeneous either in matter or construction, the result is mostly the converse of what it purports to be, for the work is more frequently weakened than strengthened by the decorative masonry. Stones of which columns are to be composed, whether each column is to be of one stone or more, are generally roughly boasted out before they are set, and are finished afterwards to traversing moulds and templets with a plumb-rule, whose sides are cut to the diminution, whatever it may be. Flutes are cut at the same time and in the same manner. The beds of the joints in columns should be worked with the greatest precision, that they may fit firmly and closely together; they must not, however, be worked hollow to make a close joint externally, or the arrises will chip off. It is considered a good plan to put a piece of thin milled lead between the beds, cut circular, and extending to within a short distance of the surface, and that the rest be filled with a fine adhesive putty, made as nearly of the colour of the stone as possible. This makes a solid bed, and protects the arrises effectually; but it will not do so well for slight columns, because it narrows the bed so materially. A joggle or dowel of hard wood or cast iron let into the core might be a sufficient counteraction, and it would certainly add to the stability of a polylithic shaft. The other parts of a columnar composition may be sufficiently cramped and joggled together with wood and metals, according to the situation, though it may be again remarked, that neither wood nor metal should be used, unless it can be protected from access even of the atmosphere.

Stone walling is generally measured by the perch of twenty-one feet superficial, at a standard of eighteen inches in thickness, or a cubic quantity of thirty-one feet six inches. Sometimes it is taken by the rod of 272 feet, like brickwork, but at the eighteen-inch standard instead of the fourteen-inch, or a brick and a half, as in the latter species of walling. The perch, however, as first stated, is the standard of this country. The quantities may be ascertained in the same manner that they are in measuring brick-work, the number of inches the wall is in thickness being substituted in the margin for the number of brick lengths. In abstracting, the superficial quantities may be taken out in

columns under the different thicknesses; the amount of Building. each column being multiplied by the thickness in inches. and divided by eighteen, gives the reduced quantity; but if the work be taken in cubic quantities, it is evident that three dimensions of every part multiplied together brings the whole at once to cubic feet, and no further process is necessary, unless it be required to bring the total quantity into reduced perches, which may be done by dividing it by thirty-one and a half.

The custom being different in different places with regard to the double measurement of quoins or angle piers, and as to whether openings, such as windows and doors, shall or shall not be deducted, because of the greater care and trouble required in setting and plumbing quoins and reveals, these particulars should be made matter of previous agreement. Perhaps the best way is to take the quantities exactly, and allow a running measurement extra on the parts requiring more than the usual quantity of labour, or, the nature of the work being of course obvious beforehand, the price per perch, per rod, or per foot cube, on the exact quantity, may be made to include the proposed extras. In the same manner, chisel-dressing (that is, facing the stones neatly and truly with the chisel), whether plain or sunk, may or may not be charged extra, according to agreement, or, in the absence of a previous agreement, to the custom of the place. To ascertain the value of stone walling, the cost of everything that enters into some fixed quantity on the spot must be calculated, for almost everything connected with it varies in almost every place. The original price of the stone at the quarry; the expense of carrying it from thence to the place where it is to be worked up; its texture or comparative hardness, which will materially affect the quantity of walling a mason may execute in a certain time; the cost on the spot, of lime and sand, and the height to which stones must be carried or hoisted from the ground; must all be ascertained and considered, as well as the wages of masons and labourers, and the sort of walling proposed to be executed.

Stone used in string and blocking courses, sills, copings, cornices, steps, quoins, columns, entablatures, &c. is measured by the foot cube, and the work on it is taken as plain, sunk, or moulded, by the foot superficial. The dimensions for the cubic quantities are taken on the unreduced block, or rather on the greatest breadth and thickness which the finished works exhibits; for instance, the string course, which appears in section at c, fig. 17, would be taken as of the thickness throughout which it holds in the wall; and in the same manner, the thickness of the sill at b would be taken under the wooden sill of the sash frame, which must have been the original thickness of the whole scantling. Stone sawed into thin slabs for paving, chimney-pieces, &c., is taken by the superficial foot, at a certain thickness, the value being ascertained from the cubic quantity and the cost of sawing on the surface, whilst some articles, being of a fixed breadth and thickness fitting them to peculiar purposes, are taken by the running foot; but both these latter modes suppose labour included.

Plain work is the even surface produced on stone by the chisel, without the necessity of taking away more than the mere inequalities, and is equivalent to what the joiner calls trying-up, that is, making the surfaces perfectly straight both longitudinally and transversely, and so that it shall be quite out of winding, which indeed is a term to express the result of trying up. Sunk work arises from the necessity of chiseling or hacking away below the level surface of the plain work, such sa the weathering of copings, string courses, cornices, &c.; and mouldings cut in stone produce what is called moulded work. Sunk and moulded work are either straight or circular; circular plain work is certainly spoken of, but incorrectly, for every flexure in stone must be produced by sinking. The joints and beds, that is, the upper

Building, and lower horizontal sides, and the vertical ends of stones. ✓ are taken as plain work, as well as their faces and edges, if they have been wrought with the chisel to produce the surface; or their superficies are taken as sawing or half plain work, if the surfaces are as the saw left them. An extra charge is made on plain work for rubbing to produce a smooth unchannelled surface; and again, a higher charge is made for plain work if it be equally channelled or furrowed in vertical lines over the surface; this latter operation is technically termed tooling. Whenever any two surfaces meet in an oblique angle, one of them may be taken as sunk work, and it will generally be that which is not parallel to its opposite side. It is valued at about two-sevenths more than plain work; and circular sunk work, that is, circular in the direction of its length, at about one-sixth more than straight sunk. Moulded work is measured by girding the moulding or mouldings with a cord or tape, carrying it into all the quirks, and round all the arrises; the dimension thus given is multiplied by the length for the superficial quantity. This is valued at about one-fifth more than sunk work, and circular-moulded at about one-half more than straight. Narrow jointings, groovings, throatings, jogglings, &c. are taken by the foot run. Mortises, holes, notches, cramps, dovetails, &c. are numbered and charged at so much a piece, according to the labour and cost involved in making them. The common pavings, landings, copings, sills, and steps generally used in London for ordinary purposes, are of a laminated stone from Yorkshire, and they are for the most part worked to size and shape in the quarry, so that there can be very little labour on them beyond the mere fitting and setting, making mortises, fitting coal-plates, traps, &c., when such are required, unless they be rubbed, which occasions, of course, an extra charge. York pavings and landings are taken by the superficial foot, at such a thickness; and copings, sills, steps, &c. by the foot run, according to their size.

Plasterer, &c.—No art in the economy of building contributes more to produce internal neatness and elegance, and no one is less absolutely important, so far as the use and stability of a structure are concerned, than that of the plasterer. Its very general application, too, is of comparatively late date; for wainscotted walls, and boarded or boarded and canvassed ceilings, or naked joists alone, are frequently found in houses of even less than a century old, both in these countries and on the Continent.

The plasterer, as the term imports, works in plastic, adhesive compositions, which are laid on walls, both internally and externally, to stop crevices, reduce inequalities, and produce an even, delicate surface, capable of receiving any decoration that may be applied to it, either in colour or otherwise. These compositions are as various as the modes of applying them, the rudest being a compost of loam, a marly clay, and lime; this is used only for the commonest purposes, and being laid on in one coat, is washed over with a thin mixture of lime and water, which process is termed white-washing; the highest work of the plasterer is the making an imitation of marbles and other costly stones, of the purest calcined gypsum, mixed with a solution of gum and isinglass, and colouring matter to produce the required imitation. For the more common operations of plastering, however, comparatively few tools and few materials are required. The plasterer is attended by a labourer, who supplies his boards with mortar, and by a boy on the scaffold with him to feed his hawk; he is necessarily furnished with a lathing hammer, a laying-on trowel, a hawk, floats, brushes, jointing trowels and rules, moulds and straight edges, together with a screen, spade, rake, and hod, for his labourer, and a feeding-spade or server for his hawk-boy. The lathing hammer is chequered on the face with indented lines, to make it less liable to slip over the head of the nail; the upper or back part of the hammer is made like a hatchet,

but very narrow, and on its inner side or edge there is Building. sometimes a square nick or grove, by means of which the workman is enabled to draw a nail that has gone awry. The laying-on trowel is a thin plate of hardened iron or steel, ten inches long and two and a half inches wide, rounded at one end and square at the other end or heel; it is very slightly convex on the face; and to the back, about the middle of it, the spindle or handle is rivetted in at right angles, which, returning in the direction of the heel parallel to the tool, fits into a rounded wooden handle, by which the workman grasps it. The plasterer is obliged to keep this implement particularly clean and dry when he is not actually using it, lest it rust in the slightest degree, as it is clear that the brown oxide of iron would sadly discolour his finer work on touching it again with the trowel. The hawk is a piece of wood about ten inches square, to receive a small portion of mortar on, for the convenience of carrying it readily up to the wall or ceiling, to be there delivered and spread by the trowel. The hawk is traversed across the back by a dove-tailed piece, into which the wooden handle is fixed at right angles, and by this the workman holds it in his left hand. A hand-float is a piece of board shaped something like a plastering trowel, with a ledge handle to it, and is used to rub over the finished work, to produce a hard, smooth, and even face. A quirk-float is of wood also, and is angularly shaped to work in angles; and a derby is a long two-handed float, which is that principally used in forming the floated coat of lime and hair. The plasterer's brush is broad and thin, with a stout or slight row of coarse or fine hair, as it may be required for rough or fine work. Jointing trowels are thin plates of polished steel, of triangular shape, the point being a very acute angle; the handle is adapted to the heel or base of the tool. They are of three or four different sizes, and are principally used in making good cornices, and joining them at their internal and external angles, which is called mitring. Jointing rules are auxiliary to the jointing trowel. Moulds are pieces of hard wood cut to the contour of cornices or separate mouldings, to assist the workmen in forming them readily. For work of any importance the moulds are cut in copper plates, which are inserted in the wooden stock, and narrow pieces of wood are fixed to the moulds transversely, to guide and steady them along the screeds. A straight edge is a board of considerable length, shot perfectly straight on one edge, to bring the plastering on a wall or ceiling to a perfectly even surface, by traversing it in every direction. A screen is a large parallelogramic wooden frame, on which metal wires are fixed at regulated distances from each other, to act as a sieve. This is propped up in nearly a vertical direction by a counter-frame hinged to it like a common step ladder, and the coarser materials which enter into the composition of plastering mortar are thrown against its outer face, to separate the particles which are too large for the purpose from the finer. The sand and lime, too, are mixed much more efficiently and completely by screening them together than in any other manner. The spade and hod are like those of the bricklayer's labourer. The rake is used to separate the hair used in the mortar, and distribute it throughout the mass. The hawk boy's server is about the size and shape of a common garden hoe, but the handle is in the direction of the instrument. With this the boy rebeats the mortar on the board, to destroy any set it may have taken, and delivers it in small pats or portions on to the plasterer's hawk.

The plasterer's materials are laths and lath nails, lime, sand, hair and plaster, of which are formed coarse stuff or lime and hair, fine stuff, gauge stuff, &c.; and besides these, a variety of stuccoes and cements, together with various ingredients to form colouring washes, &c. are more or less in request.

Laths are narrow strips of some straight-grained wood (in this country they are generally of fir, though oak laths are sometimes used), in lengths of three and four feet, or to

quarterings of a partition are set, and in thickness from one-eighth to three-eighths of an inch; those of the greater thickness are called lath and a half. Lath nails are either wrought or cut; cut nails are in common use in this country with fir laths. Coarse stuff is composed of ox or horse hair from the hide, in addition to the lime and sand mortar of the bricklayer and mason; this is intended to act as a sort of mesh to net or tie it together, and form a coarse but plastic felt. The hair should be as long as it can be procured, and free from grease and filth of every kind. Road drift is unfit to be used for mortar, unless it be completely cleansed from all animal and vegetable matter, and of all mud and clay. Nothing but clean sharp sand should be used with the lime and hair in the composition of this, any more than of brick mortar. Fine stuff is a mortar made of fine white lime, exceedingly well slaked with water, or rather macerated in water to make the slaking complete; for some purposes a small quantity of hair is mixed up with this material. Fine stuff very carefully prepared of the finest powdered lime macerated so completely as to be held in solution by the water, thus forming a mere paste, which is then allowed to evaporate until it is of a sufficient consistence for working, is called putty. Gauge stuff is composed of about three-fourths of putty and one-fourth of calcined gypsum or plaster of Paris; this may be mixed only in small quantities at a time, as the plaster or gauge renders it liable to set very rapidly. Bastard stucco is made of twothirds fine stuff, without hair, and one-third of very fine and perfectly clean sand (the cleanliness or purity of sand may be determined by the facility with which it may, when in a moist state, be struck off from the hand without leaving a soil); and common stucco is composed of about threefourths of clean sharp sand and one-fourth of the best lime, well incorporated. This must be protected from the air from the time it is made up until it is required to be laid on the walls. The cement best known and most commonly used in this country is called Parker's, or Parker's Roman cement. This material, when of good quality, with fine clean sharp sand, in the proportion of about three of the former to one of cement, and well executed, forms a very good external coating for walls.

A composition known as Portland cement, because the mortar formed by it when mixed with sand, presents, or is supposed to present, the appearance of stone from the Portland quarries, has grown of late years into repute in London more particularly, and it is in one particular at least preferable for an outside stucco, that the colour to which it dries is sufficiently agreeable to the eye without any colouring wash, whereas Parker's cement is too often of a dark dirty tint, requiring painting or colouring to render it tolerable. Portland cement is also much esteemed as being proof against water when used as a mortar in setting brickwork, and in the composition of concrete for foundations.

The various coatings of plastering are thus designated: On laths, plastering in one coat simply is said to be laid, and in two coats, laid and set. In three-coat plastering on laths, however, the first is called the pricking up, the second is said to be floated, and the third set. On brick or stone walls, without the intervention of laths, plastering in one plain coat is termed rendering; with two coats, a wall is said to be rendered and set; and in three, rendered, floated, and set. Before the plasterer begins to lath a ceiling, he proves the under face of the joists, to which he has to work, by the application of a long straight edge, and makes out any slight inequalities in them, when the work is not to be of a very superior description, by nailing on laths or slips to bring them as nearly even as he can. When the inequalities are great, or if the work is to be of fine quality, he recurs to the carpenter, who takes off inordinate projections with his adze, and nails on properly dressed slips where the joists

Building, suit the distances at which the joists of a floor or the do not come down low enough, and thus brings the whole Building. to a perfect level. This operation is called firring, that is, putting on pieces of fir, though it is vulgarly termed and frequently spelt furring. If it be a framed floor of ceiling joists the plasterer has to work to, it is tolerably sure to be straight; but the carpenter must have firred down on the beams or binders to the level of the ceiling joists, unless the ceiling joists have been nailed to the beams or binders, when nothing of this kind need be necessary. If a ceiling is to be divided into compartments or panels, the projecting or depending portions must be bracketed or cradled down to receive the laths. It is an important point to be attended to in plastering on laths, and in ceilings particularly, that the laths should be attached to as small a surface of timber as possible, because the plastering is not supported or upborne by its adhesion or attachment to the wood, but by the keying of the mortar itself, which passes through between the laths, and bends round over them. If then the laths are in constantly recurring contact with thick joists and beams, the keying is as constantly intercepted, and the plastering in all such places depends entirely on the portions between them which are properly keyed. Under a single floor, therefore, in which the joists are necessarily thick, a narrow fillet should be nailed along the middle under the whole length of them all, to receive the laths and keep them at a sufficient distance from the timber to allow the plastering to key under it; and thus too the surface might be made more perfectly even, by blocking out the fillets, and contrariwise, as it is in single floors that inequalities mostly occur. This being all arranged, the plasterer commences lathing. The laths should be previously sorted, reserving the crooked and knotty, if there be such, for inferior works, and selecting the best for the work of most importance, so that the workman shall find none to his hand that is not fit to be brought in. Taking a lath that will reach across three or four openings, he strikes a nail into it on one of the intermediate joists, at about three-eighths of an inch from the one before it, and then secures the ends of that and the one that it meets of the last row with one nail, leaving the other end of the lath he has just set to be secured in the same manner with that which shall meet it of the next bay in continuation. It is of importance also that he pay attention to the bonding of his work, either by using longer and shorter laths in bays or squares, and in breaking the headings, or with laths of the same length, the first and last courses or bays only having the bond formed by half laths. In lathing on quartering partitions and battened walls, the bonding is not a matter of much importance; nor is the thickness of the timbers behind the latter of so much consequence as in a ceiling, because the toothing which the thickness of the lath itself affords to the plastering is enough to support it vertically; but, nevertheless, the more complete the keying, even in works of this kind, the better, as the toothing above will not protect it from any exciting cause to fall forwards, or away from the laths. The thinner or weaker sort of lath too is generally considered sufficiently strong for partitions, whilst the stronger is used for ceilings. Thin weak laths, if used in a ceiling, are sure to produce inequalities, by sagging with or yielding to the weight attached to them. A chance one or two weak ones in a ceiling of otherwise strong laths may be the ruin of the best piece of work. Care should be taken therefore not to allow a thin lath, or one of unequal thickness, to go on to a scaffold with thicker and more equable ones, lest the workman should, through carelessness or otherwise, put it up with the rest. When the lathing is completed, the work is either laid or pricked up, according as it is to be finished with one, two, or three coats. Laying is a tolerably thick coat of coarse stuff or lime and hair brought to a tolerably even surface with the trowel only; for this the mortar must be well tempered, and of moderate consistence,—thin or moist enough to pass rea-

Building, dily through between the laths, and bend with its own weight over them, and at the same time stiff enough to leave no danger that it will fall apart, a contingency, however, that in practice frequently occurs in consequence of badly composed or badly tempered mortar, unduly close lathing, or sufficient force not having been used with properly consistent mortar to force it through and form keys. If the work is to be of two coats, that is, laid and set, when the laying is sufficiently dry, it is roughly swept with a birch broom to roughen its surface, and then the set, a thin coat of fine stuff, is put on. This is done with the common trowel alone, or only assisted by a wetted hog's bristle brush, which the workman uses with his left hand to strike over the surface of the set, while he presses and smooths it with the trowel in his right. If the laid work should have become very dry, it must be slightly moistened before the set is put on, or the latter, in shrinking, will crack and fall away. This is generally done by sprinkling or throwing the water over the surface from the brush. For floated or three-coat work, the first, or pricking up, is roughly laid on the laths, the principal object being to make the keying complete, and form a layer of mortar on the laths to which the next coat may attach itself. It must, of course, be kept of tolerably equal thickness throughout, and should stand about one-quarter or three-eighths of an inch on the surface of the laths. When it is finished, and while the mortar is still quite moist, the plasterer scratches or scores it all over with the end of a lath in parallel lines from three to four inches apart. The scorings should be made as deep as possible without laying bare the laths; and the rougher their edges are the better, as the object is to produce a surface which the next coat will readily attach itself to. When the pricked up coat is so dry as not to yield to pressure in the slightest degree, preparations may be made for the floating. Ledges or margins of lime and hair, about six or eight inches in width, and extending across the whole breadth of a ceiling or height of a wall or partition, must be made in the angles or at the borders, and at distances of about four feet apart throughout the whole extent; these must be made perfectly straight with one another, and be proved in every way by the application of straight edges: technically these ledges are termed screeds. The screeds are gauges for the rest of the work; for when they are ready, and the mortar in them is a little set, the interspaces are filled up flush with them; and a derby float or long straight edge being made to traverse the screeds, all the stuff that projects beyond the line is struck off, and thus the whole is brought to a straight and perfectly even surface. To perfect the work, the screeds on ceilings should be levelled, and on walls and partitions plumbed. When the floating is sufficiently set and nearly dry, it is brushed with a birch broom as before described, and the third coat or set is put on. This for a fine ceiling that is to be whitened or coloured must be of putty; but if it is to be papered, ordinary fine stuff, with a little hair in it, will be better. Walls and partitions that are to be papered are also of this latter, or of rough stucco; but for paint the set must be of bastard stucco trowelled. This coat must be worked of exactly the same thickness throughout, to preserve to the external surface the advantage that has been obtained by floating. For all but this last mentioned, the set on floated work, the trowel and brush are considered sufficient to produce fine and even work; but trowelled stucco must moreover be hand-floated. In this operation the stucco is set with the trowel in the usual manner, and brought to an even surface with that tool to the extent of two or three yards. The workman then takes the handfloat in his right hand, and rubs it smartly over the surface, pressing gently to condense the material as much as possible. As he works the float he sprinkles the surface with water from the brush in his left hand, and eventually pro-

duces a texture as fine and smooth almost as that of po- Building. lished marble. But lathing and plastering on laths as practised in England, is at best a very flimsy affair, and greatly requires improvement. Stronger laths than the laths commonly employed, put on further apart, and with headed wrought nails, and the plastering laid on upon both sides in upright work, or both above and below the ceilings at the same time, two men working against one another will produce work in some degree worthy of the name. But the practice of the French in this respect—a recent practice truly—is well worthy the consideration, and to a great extent the imitation, of English plasterers. The process of plastering on the naked brick or stone wall differs but little, except in name, from that we have described as the mode on lath. The single coat, or equivalent for laying, on lath, is rendering, and it need differ only in the quantity of hair, which may be less than is necessary for laying, and in the consistence of the mortar, which may be made more plastic, to work easier, and because in a moister state it will attach itself more firmly to the wall: the wall, however, must itself be wetted before the rendering is applied. The set is the same, and is put on in the same manner as to two-coat work on lath. For three coat, or floated work, the first or rough rendering should be made to fill up completely whatever crevices there may be in the work behind it, and be incorporated with it as much as possible. As its name imports, its surface may, indeed should, be rough; but it is not scratched or lined as the similar coat on lath is: for this, too, the wall must be previously wetted, that the mortar may the better attach itself to it. For the floating, screeds must be formed as before described, and the consecutive process is exactly the same as on lath, both for the floated and for the set coat. In almost every case in which plastering is to be floated, the workman finds a guide for the feet of his wall screeds in the narrow grounds which the joiner has previously fixed for his skirtings; from these he plumbs upwards, and makes his work perfectly flush with them.

Mouldings and cornices, as large combinations of mouldings and flat surfaces in the angles of rooms, immediately under their ceilings, are called, are formed with running moulds, and are generally executed before the setting coat is put on the walls and ceiling. If the cornice do not project more than about an inch and a half, or two inches, from the ordinary work, a backing of lime and hair will be sufficient; and if any one part only happen to be more than ordinarily protuberant, a row of nails from six to twelve inches apart stuck into the wall or ceiling in the line of that part will give it sufficient support. But if the general mass of the cornice be more than that amounts to, and extend more than six or eight inches along the ceiling, it must be bracketed out, and the bracketing lathed and pricked up, as for ordinary work. This pricking up, or other preparation, must of course be perfectly set before the cornice is run; and there should be one-fourth of an inch at least of clear space between the preparation and the mould in the nearest part. A wooden screed or parallel straight edge is tacked with brads on to the wall, and another on the ceiling, if the cornice be large and heavy, as guides or gauges for the mould, whose rests are chased to fit them; and then one man laying on gauge stuff in an almost fluid state with an angular trowel, another works the mould backwards and forwards over it, which strikes off what is superfluous, and gives the converse of its form to the rest. The mould is never taken down from the work at right angles to the line of it, but is drawn off at the end, so that none of the parts of the moulding or cornice is injured or torn by it, which must otherwise frequently be the case, from the peculiar forms at times given to the details. If a cornice be too large and heavy to be executed at once, it may be done in the same manner at two or more times, in so many parts; and if any part or parts of a moulding or cornice is to be

Building. enriched, the space for it is left vacant by the mould, and the enrichment is afterwards supplied. As a cornice cannot be completed up to the angles by the mould, it is worked by hand in those situations to a joint. The joinings are termed mitres, and in forming them the plasterer uses the jointing tools we have already described. Models for enrichments are made by the modeller, according to the design or drawing submitted to him, and from them the plasterer makes wax moulds, or, as in ordinary practice, the modeller supplies the moulds in which the ornament is cast in plaster of Paris. If the ornament be in recurring lengths or parts, as is usually the case, only one length or part is modelled, and casts of as many as are required are taken from the mould; some single ornaments, again, which are very large, require to be moulded and cast in parts, which are put together by means of cement. When the cast ornaments are sufficiently dry the pieces are scraped and trimmed, the joints made clean and even, and they are set in the cornice with plaster of Paris, with white lead, or with a composition called iron cement, as the case may require. If the castings have something in the cornice to rest upon, the first will do; but if there is nothing to retain or attach them but the cement, one of the two latter must be used. Flowers and other ornaments in ceilings which are too large and heavy to be trusted to adhesive matter alone, must be screwed on to wooden cradling behind and above them.

In plastering a wall with common stucco (and its use is mostly for outside work), the first thing to be done is to remove the dust from it by brushing, and then wetting it very completely with water; if the wall to be stuccoed be an old one, or one of which the joints have been drawn, the mortar of the joints must be chipped or even raked out, and the bricks picked, to expose a new and porous surface to the plastering before brushing and wetting. The wall is then covered with stucco in a fluid state, applied with a broad and strong hog's-bristle brush, like common whitewashing. When this is nearly dry the stucco must be laid on as in common rendering, unless the work is to be floated, when the process is nearly similar to that in floated plastering. Screeds must be formed at the highest and lowest extremities of the wall, or of that part of the wall which is in the same vertical line, and is not intercepted by string courses, and be returned at the angles, putting the whole surface into a sort of frame. These must be made perfectly straight and plumb, so as to be quite out of winding, by the careful application of the plumb-rule and straight edge. Inner vertical screens must then follow at three or four feet apart across the whole surface, and be made to range exactly with the outer ones, and then the interstices must be filled in as before. As the work is made good it must be well rubbed with the hand float, as in the execution of trowelled stucco internally, to compress the material, and produce a hard, even, and glossy surface. Preparations for cornices and other projections from the straight surface of the work must have been previously made in or on the brick or stonework, by the protrusion of bricks, tiles, or whatever may be best suited to form a core, and the mouldings and cornices are run with moulds, in the manner described for the same things internally, only that in work of this kind no plastic material but the stucco itself is used; that is, there is no preparation of any softer material than the stucco itself put under it. In running cornices in this material, workmen are very apt to mix a little plaster of Paris with the stucco to make it set under the mould, and thus give sharpness and fulness to the mouldings; but this should not be permitted; for the plaster is not qualified to stand the weather as the stucco is, and, if mixed with it, will produce premature decay. When the stucco is perfectly dry, it may be painted in oil colours, or be coloured in distemper; and in either case it is generally ruled over the surface with a lead point, to give it the appearance of gauged stone-work.

Rendering in Roman cement is executed almost exactly Building. in the same manner as stucco rendering is, only that it is laid on the saturated wall directly, without the preliminary operation of roughing in, or washing the surface with a solution of the material. The same process, too, is followed in floating this cement, and with the same exceptions; and as, in addition to its superior hardness and capacity for duration, it is a quick-setting cement, it is far preferable to any of the common stuccoes for running cornices, mouldings, &c. Roman cement, or as it is vulgarly called by most persons concerned in the operations of building, compo, a contraction of composition, may, like stucco, be painted in oil or coloured; but instead of a size colour, which is used for almost every other purpose in plastering, the colour for this composition is mixed with diluted sulphuric acid. This too may be lined and tinted to imitate stone and stonework of any description.

It may not be amiss here to refer to some of the causes of the premature decay which takes place in stuccoes and cements when used externally as a coating to walls. The primary cause is the presence of muddy earth and decayed animal and vegetable matter in the sand used with the lime and cement. To this may be added frequent impurities in the limes and cements themselves, particularly of argillaceous matter in the former, and sometimes to the too great proportions of lime or cement to sand. These things might, however, remain quiescent for a long time, if the work were well protected from access of moisture, which is the grand exciting cause. The paint, or distemper wash, on the surface, is generally sufficient to prevent the rain which may beat against a vertical face from penetrating, especially if the work have been well hand-floated and trowelled, to make it close and compact; but the evil arises from exposure above, and from the numberless horizontal unfloated surfaces which are constantly presented. These receive and collect the water, and convey in streams over the vertical surfaces what is not immediately absorbed; and the work thus becoming saturated, frost seizes and bursts it, or warmth calls the vegetative powers of the impurities in it into action, and the whole is covered with a green sward. Let the sand of which a plaster composition is to be formed, whether with lime or cement, be washed until it no longer discolours clean water, and be well compounded with cementitious matter free from the impurities with which it is so frequently charged; let the work be well hand-floated and trowelled, particularly on the backs or upper horizontal surfaces of projections, and protected above by projecting eaves or otherwise; and the work, with common care and attention to paint or distemper at intervals, will last as long as anything of the kind can be expected, or is found, to last anywhere.

A cheap and useful covering for external walls which are protected by projecting eaves, in plain buildings, is rough cast. This is executed in the following manner. The surface is first roughed in, or rendered with lime and hair; and when that is set dry, another coat of the same material is superadded, laid as evenly as it can be without floating, and as soon as a piece of two or three yards in extent is executed, the workman lays on it an almost fluid mixture of fine clean gravel and strong lime, which have been well mixed together. This is immediately washed with any ochreous colour that may be desired, and the whole dries into one compact mass.

In renovating and repairing plastering, the whole surface is first well washed to remove the dirt which may have attached itself, and as much of the earthy matter of the previous coat of whitening or colouring as will come away; any injuries the work may have received, such as cracks and fractures, are then repaired; and when the new stuff is quite dry, the joinings are scraped to produce an even surface, and the whole is again whitened or coloured once or twice, or oftener, as may be required, to make it bear

Building. out well. Stuccoed walls which have been painted must ing eaves, a wide board is placed over the rafters' feet; but Building. be well rubbed with pumice stone, to take off the old paint as much as possible before they are newly painted.

Plastering is measured in feet and inches, and valued by the yard superficial of nine square feet. It is taken under separate heads according to the nature and description of the work, such as rendered; rendered and set; rendered, floated, and set; and with lath, for the lathing and plastering are valued together; lathed and laid; lathed, laid, and set; and lathed, plastered, floated, and set. Whitening and colouring are taken under separate heads, and the quantities of them are reduced to yards also. Work done in narrow slips, such as to the jambs and soffits of doorways and other openings, is measured by the foot superficial, and so are the backs of niches, niche-heads, &c. Arrises, or external angles and quirks, are taken extra by the running foot, and beads and other very small mouldings are measured in the same manner. Larger mouldings, however, and cornices, whether plain or enriched, are taken by the foot superficial, and the quantity is ascertained by multiplying the length, minus once the projection, by the girth, of the moulding or cornice, which is best determined by measuring its mould with a tape or cord. Enrichments are either numbered or taken at so much the running foot, making the modeller's an extra charge, if the design was original and required special modelling and moulding; and mitres are taken at so much a piece beyond a limited number. This number, in an ordinary room, is generally the four which necessarily occur in its four angles, making those which are usually occasioned by the projection of the chimney-breast extra; but it is not an uncommon practice to bring them within the limit, and count only all that may occur above eight, for no difference is made between internal and external angles. Circular work, whether it be convex or concave, of every kind, may be charged about one-fourth higher than straight. Stuccoes and other compositions are also valued by the yard, and according to the description of the work, with almost similar exceptions to those mentioned with regard to common plastering. Used externally, however, all the arrises or external angles, throatings, grooves, chamfers, &c., are taken as extra by the running foot at such a width.

In the practice of measuring plasterer's work, it is customary to take the whole surface at first, and then whatever deductions there may be. Thus the side of a room is measured over all, from the upper edge of the skirting grounds up to the cornice. The windows and doors are deducted by taking to the outside of their framed grounds for the width, and from the skirting grounds up to the top of those of the door or window for the height. If there be more than one of each, or either of them, to deduct, of course the same dimension will serve for all, multiplied by as many times as each deduction occurs. A ceiling also is generally taken over the whole surface, from cornice to cornice, a chimney-breast or other projection being made a deduction. It is a moot point whether the plasterer should not be allowed that part of the ceiling and wall which is covered by the cornice, as he has actually finished the whole except setting. When the cornice is bracketed, however, he may fairly claim up to the brackets.

Scaffolding is not generally made an extra charge with new work; but with old work it is, if scaffolding be necessary; for, under ordinary circumstances, the plasterer is enabled to wash, stop, and whiten the ceilings and walls of rooms from trestles, with boards laid across them. In lofty saloons and halls, churches, &c. scaffolding is indispensable, and must then be charged. A scaffold is necessary, too, to a front that is to be plastered in any way; but it may be afterwards washed, repaired, and coloured, from a ladder, without the intervention of a scaffold.

Slater.—The principle on which slates are laid is that which is employed in plain tiling. To a roof with project-VOL. V.

when the eaves tail into gutters, the gutter-board is made wide enough to receive the eaves-course. For light slating it is necessary to board a roof all over. This is done by the carpenter, and is called sound-boarding; but for strong heavy slates, fillets or battens are better; and these are laid by the slater himself, to suit the length of his slates. Three inches wide and one inch thick is a sufficient size for them, if the rafters be not more than twelve inches apart. Against gable or party-walls, a feather-edged board called a tilting fillet is laid to turn the water from the wall.

Before he begins to work on a roof, the slater shapes and trims the slates on the ground. With a large knife or chopper called a saixe, sax, or zax, he strikes off the unevenness on one side of a slate, making it as nearly straight as he can; he then runs a gauge along it, marking the greatest width the slate will bear, and, cutting to that line, makes it perfectly parallel. He next, with a square, brings the thickest and best end to right angles with the sides, generally by chopping, but sometimes by sawing; and then marking upward from the squared foot or tail, makes two nail holes, where, by calculating the gauge the slate in hand will bear, he knows the batten must come. All the slates being thus gauged to width, dressed, and sorted in lengths, they are then taken up to the roof in rotation, beginning with the longest and largest for the lowest courses. The first course the slater lays is little more than half the length of that which is intended to cover it, and is necessary to break the joints at the eaves. This is called the doubling eaves-course; and the covering eaves-course is brought to the same foot line, completely to cover it. Then to ascertain the gauge: From the length of the slate deduct the bond, which should never be less than two inches, and need not be more than three and a half inches, and the half of what remains will be the gauge. Thus, if the bond be fixed at three inches, and the slate is two feet three inches in length, the gauge will be one foot. This gauge or margin is set up from the foot of the eaves-course at each end, and a line strained to mark it along the whole length, and so on, to the ridge or top, where another half-course is required to complete the work, and that is in its turn secured by a covering of sheet lead. To a hipped roof care is taken to complete every course up to the angle, by cutting slates to fit its inclination; and these are also covered by an overlap of sheet lead. In nailing a slate, it must not be strained or bent in the slightest degree, or it will certainly fly in some sudden atmospheric change, to which it is of course constantly liable, even if it escape fracture, from being trodden on by the workmen themselves or by others. Copper, being less liable to oxidize from exposure to common causes than any other metal that will answer the purpose, is generally used for slate nails. Zinc is also used for the purpose; and iron tinned and painted nails are sometimes substituted by dishonesty on the part of the workman or builder, or bad economy on that of the proprietor.

A very light and neat covering is produced, by laying wide slates side by side, and covering their joints with narrow slips bedded in putty, the overlap at the ends being no more than the bond is with the usual mode. It is known as patent slating, and was introduced by the late Mr Wyatt, though he never obtained a patent for it. Indeed it is in principle the mode which was adopted in ancient Greece in covering the roofs of temples. Neither boards nor fillets are used, the slates bearing from rafter to rafter, and to the rafters the slates are screwed. The covering slips are also screwed, as well as bedded in putty. Slating of this kind may be laid at no greater elevation than ten degrees; whereas, for slating in the ordinary way, the angle should never be much less than twenty-five degrees, though large slates with a three and a half inch bond, carefully laid and pointed, may perhaps be trusted at a rise of twenty degrees.

Building. This mode of applying slate is not without the disadvantage attending the fixing of any substance that freely takes up and readily parts with heat. In expanding and contracting, the joints are too often destroyed and leaks are the common

The mode above described of ascertaining the gauge or margin by the bond, is equally applicable to every sort of roof-covering that is made up of small inflexible parallelogramic slabs or tablets; and it should be borne in mind that the greater the angle is at which the rafters rise, or, in technical language, the higher the pitch of the roof, the less the bond may be, and vice versa. With slabs or tablets that vary in length, too, as slates generally do in this country as they are brought to market, it is the bond which it is of importance to observe; but if they are of an invariable length, as tiles are, it is sufficient that the gauge or margin be attended to.

The best slate this country produces is from the quarries of Bangor in Caernarvonshire, and of Kendal in Westmoreland. Good slate is also procured in the neighbourhood of Tavistock in Devonshire, and in some parts of Scotland. The scantlings of slate are cut in the quarries to set sizes, and these are split into tablets, thicker or thinner according to the size of the slab and the capacity of the slate; for the inferior qualities are neither so compact in material, nor so clearly laminated or schistose, as the superior, and will not therefore rend so freely. The sizes of slates best known in the British market are distinguished by the names of ladies, countesses, duchesses, and queens. Ladies measure fifteen inches by eight, countesses twenty inches by ten, duchesses twenty-four inches by twelve, and queens thirty-six inches by twenty-four; and they are esteemed in proportion to their magnitude. Besides these, there is a slate which equals the queen in extent of surface, but is of very much greater thickness; this is called Welsh rag. A smaller slate, again, which is less indeed than the lady, and is cut from the refuse of large scantlings, is called a double. In size it does not often exceed twelve inches by six. Westmoreland slates are thick and heavy like the Welsh rag, but do not generally run so large.

The best slate is of a bluish-gray colour, and breaks before the zax like well-burnt pottery, and will ring in the same manner on being struck. Whitish or light gray-coloured slate is for the most part stony: dark blue or blackish slate, on the other hand, cuts very freely; but it absorbs moisture, and decays rapidly.

Slater's work is measured by the square of a hundred superficial feet. In a parallelogramic piece of slating, as in a gabled roof with projecting eaves, the length along the eaves by the breadth or height from that to the ridge, with the addition to the latter dimension of the gauge or margin for doubling the eaves, will give the quantity of one side. Projections for chimney-shafts or breasts, skylights, &c., must be deducted; but an addition must be made of the run round them by six inches, for cutting and waste. In a hipped roof the length from point to point of the eaves on one of the long sides of a quadrilateral roof, by the breadth or height, with the addition as before, will give that side and half of The other side will, of course, in the each of the ends. same manner, include the other halves of the ends. length of the hips taken as a superficial dimension in feet, or by twelve inches, is added for cutting and waste, and valleys are taken and added in the same manner when they occur.

Carpenter.—For the scientific principles of carpentry we must refer the reader to the article under that head, and to the articles Roof, Strength of Materials, and Timber. Here we have merely to speak of the practical details of carpenter's work in the operations of building,—of carpentering, indeed, or the practice of carpentry, considering it as a mechanical art.

The carpenter works in wood, which he receives from the sawyer in beams, scantlings and planks, or boards, which he cuts and combines into bond-timbers, wall-plates, floors, and

roofs. He is distinguished from the joiner by his operations Building. being directed to the mere carcass of a building,—to things which have reference to structure only, Almost everything the carpenter does in and to an edifice is absolutely necessary to its stability and efficiency, whereas the joiner does not begin his operations until the carcass is complete; and every article of joiners' work might at any time be removed from a building without undermining it or affecting its most important qualities. Certainly, in the practice of building, a few things do occur which it is difficult to determine to whose immediate province they belong; but the distinction is nevertheless sufficiently broad for general purposes. The carpenter, with the bricklayer or mason, and some of the minor artificers, constructs the frame or hull; and the joiner, with the plasterer and others, decorates and rigs the vessel: on the former the actual existence of the ship depends, and on the latter depends her fitness for use.

The carpenter frames or combines separate pieces of timber by scarfing, notching, cogging, tenoning, pinning, and wedging; and the tools he uses are the rule, the axe, the adze, the saw, the mallet, hammers, chisels, gouges, augers, hook-pins, a square, a bevel, a pair of compasses, and a gauge, together with the level and plumb-rule; besides these, planes, gimlets, pincers, a sledge hammer, a maul or beetle, wedges, and a crow-bar, may be considered useful auxiliaries, though they are not absolutely necessary to the

performance of works of carpentry.

To scarf is to cut away equally from the ends, but on the opposite sides, of two pieces of timber, for the purpose of tying or connecting them lengthwise. This is done to wallplates and bond-timber, and especially to beams when they are required of greater length than can be procured without joining. (See CARPENTRY.) The usual mode of scarfing bond and wall-plates is by cutting about three-fifths through each piece on the upper face of the one and the under face of the other, about six or eight inches from the end, transversely, making what is technically termed a calf or kerf, and longitudinally from the end, from two-fifths down on the same side, so that the pieces lap together with a sort of half dovetail. The heavy supervening weight of the wall and joists renders it impossible that they should be drawn apart without tearing the fibres asunder or lifting the weight. (See fig. 20.) Nevertheless these joints are generally spiked, Plate and it is always required that they be made to fall in or un- XLIX. der a pier. Notching is either square or dovetailed; it is used in connecting the ends of wall-plates and bond-timber at the angles, in letting joists down on beams or binders, purlines on principal rafters, &c. Nos. 1, 2, 3, 4, and 5, fig. 21, show varieties of notches applied as we have described. No. 1 is a simple square notch or halving of the ends of bondtimbers or wall-plates at a right angle; No. 2, a dovetailed notch. No. 3, the notch most commonly used; it is similar to No. 1, but that the ends are allowed to run on so that the one piece grasps the other, and each forms a cog to the other. No. 4 is an oblique-angled, dovetailed notch; and No. 5 shows how joists are notched or let down on beams and binders, and purlines on principal rafters. A notch is cut into the under edge of the joist or purline an inch or an inch and a half in depth, and considerably shorter than the beam, binder, or rafter is in thickness. Notches are also cut down on the upper angles of the bearing pieces as long as the rider is thick, as deep as the notch before described of the latter is, and so far in as to leave a thickness on its own edge equal to the length of the notch in the riding joist or purline. In the diagram one joist is indicated in its place let down in the notch, and another indicates the notch in its own edge, and leaves exposed the notches in the binder. Cogging, or corking, as it is vulgarly termed, is the lastmentioned species of notch extended on one side, and leaving a narrow tooth or cog alone in the bearing-piece flush with its upper face, No. 1, fig. 22. It is used principally in

cog is here made narrower, because the end of the joist or rider coming immediately beyond the plate, that part which forms the shoulder of the notch would be liable, on being strained, to be chipped off or torn away, if it were not kept as long as possible; and it is not of so much importance to guard against weakening a wall-plate which is supported along its whole length, as a beam, binder, or principal rafter, which rests on distant points alone. No. 2 of the same diagram shows another mode of tailing on joists and beams by a dovetail notch, which, to distinguish it from the flat notches, Nos. 2 and 4, fig. 21, is called corking, or cogging also, though the operation certainly is not cogging. This is a good mode if the timber be so well seasoned as not to be likely to shrink more; but it would be improved by allowing the rider to take a bearing in a notch like that to No. 1 before the dovetail commenced, as at No. 3, for in the ordinary mode it is weakened in a point of great importance.

Tenoning implies mortising also, as a matter of course. They are the names of the two operations necessary to one result,-that of producing a connection between two pieces by inserting part of the end of one into a hole of similar size cut in the side or face of the other. A tenon is formed by cutting in on each side or edge of a piece of timber, near its end, transversely, to a certain depth, or rather, leaving a certain part of the breadth or depth uncut, and then cutting in longitudinally from the ends as far from each edge as the transverse cuts have been made in depth, thus removing two square prisms and leaving a third undivided. This is the tenon. An excavation in the side of a piece of timber, of a certain depth, in the direction of its thickness, parallel to its edges, and bounded lengthwise by lines at right angles to them, is a mortise. Tenons and mortises are made of exactly corresponding size, and are most frequently at equal distances from one or the other side or edge of the two pieces to be conjoined; and for the most part, too, every angle formed in the process of tenoning, both internal and external, is a right angle. Tenons are called joggles in some situations, when they are not intended to be borne upon; and their use is merely to keep the piece of timber to which they belong steadily in its place, without being liable to slight accidents from lateral pressure or violence. In combining timbers by means of mortises and tenons, to produce as great a degree of strength as possible, it must be obvious that the object to be kept in view is to maintain the end or tenon of the one as large and efficient as it may be, and weaken the other as little as possible in forming the mortise. For the efficiency of the mortised piece in a horizontal bearing, it is clear that as much of its thickness should be below the mortise as possible, as at a, fig. 23; for if it be put low, as at b, the superincumbent weight on the tenon would more readily split or rend it in the direction of the grain, as indicated; but the case is inverted with the tenoned pieces. With the mortise at  $\alpha$  the tenon could only have the efficacy of so much of the piece to which it belongs as there is of it above its under surface, which is a very small part of its depth; whereas with the tenon at b it would command the power of the greatest part of the depth. To guard as much as possible against the danger of too great a mortise and too small a tenon on one side and the other, and to obviate the difficulty arising from the efficiency of one or the other of the two pieces being affected by putting the tenon too high or too low, a compound, called a tusk tenon, is used for almost all horizontal bearings of any importance, especially to joists and binders, to trimmers, beams, girders, brestsummers, &c. The body of the tenon in this is a little above the middle of the end, and it runs out two, three, or four inches, or more, as the case may require. Below it the tusk protrudes, and above it the shoulder is cut down at an obtuse angle with the horizontal line, giving the strength of the whole depth of the timber above the under tusk to the

Building tailing joists and beams on wall and tem-plates, and the tenon, and giving it a bearing in a shallow mortise, whilst a Building. greater depth of the mortised piece than the tusk rests on receives the body of the tenon, and so protects its comparatively narrow margin from undue pressure. The diagram No. 1, fig. 24, shows the tusk tenon, with the section of a beam into which it is mortised; and No. 2 indicates perspectively the appearance of the mortise in front. See also CARPENTRY.

> Pinning is the insertion of nearly cylindrical pieces of wood or iron through a tenon, to detain it in the mortise, or prevent it from being drawn out by any ordinary force. For this purpose the pin is inserted either in the body, or beyond the thickness, of the mortised piece, as indicated at a, fig. 24, or at a, fig. 25. Wedging (see bb, No. 2, fig. 25) is the insertion of triangular prisms, whose converging sides are under an extremely acute angle, into or by the end of a tenon, to make it fill the mortise so completely, or bind it so tightly, that it cannot be easily withdrawn. The wedging of tenons also assists in restoring to the mortised piece of timber much of the strength it had lost by the excision of so much of its mass, which indeed the tenon itself does if it fit closely in every direction; but the assistance of the wedge renders the restoration more perfect than the tenon could be made to do of itself, by compressing the fibres of both, longitudinally to those of the one, and transversely to those of the other, thus removing the tendency of the mortised piece to yield in any degree in the weakened part, though it cannot make up the loss in its tenacity occasioned by the scission of its fibres.

> In scarfing, cogging, and notching, the shoulders are always cut in with the saw; but the cheek is for the most part struck out with the mallet and chisel, or adze, as may be most convenient. Tenons should be made entirely with the saw: mortises are generally bored at the ends with an auger whose diameter equals their thickness; the intervening part is taken out with a wide chisel, cutting in the direction of the fibre; and the ends are squared down with a chisel whose breadth just equals the thickness of the mortise. Wood pins must be rent to insure the equal tenacity of their whole mass. Wedges are cut with the saw, but straight-grained stuff is always preferred for them.

> Bond-timbers and wall-plates should be carefully notched together at every angle and return, and scarfed at every longitudinal joint. The scarf shown at fig. 20 is sufficient for the purpose; and the notch at No. 3, fig. 21, may be preferred where notching is required; neither pinning nor nailing, however, can be of great use to either the notch or the scarf. Bond-timbers are passed along and through all openings, and are not cut out until such openings are to be permanently occupied, that is, windows with their sashframes, &c., because they assist in preventing irregular settlements, by helping to carry the weight of a heavy part along the substruction generally, instead of allowing it to press unduly upon the part immediately under it.

> Whatever notches and cogs for beams and joists are required in wall and tem-plates, should be made before they are set on or in a wall; for, as they are always bedded in mortar, anything that may break the set must be avoided.

> It is the duty of the carpenter to supply the bricklayer or mason with wood bricks in sufficient quantity, and to direct him where they should be placed to receive the joiner's fittings, or the battening, which the carpenter himself may have

to put up for the plasterer.

The framed quartering partitions which may be required should be set up in every story before the beams and joists of the floors are laid, that their horizontal timbers may be notched on to the wall-plates, and that the joists or binders may be notched on to them if occasion require it; but they should be fixed rather below than above the level of the wall-plates, because they are not liable to settle down so much as the walls, though even that will depend in a great Plate CL.

Building. degree on the nature of the walling, __ 's liability to ノ yield.

The carpenter makes and fixes or sets centres or an kinds, whether for single arches, or niches. The striking out of the centres, in the first instance, is necessarily contingent on the arches to be turned on them, for the forms of which the carpenter must look to the bricklayer or mason, whose instructions for describing arches will be found under the head STONE-MASONEY. Large centres are framed in distinct ribs, and are connected by horizontal ties; whilst small ones are made of mere boards cut to the required sweep, nailed together, and connected by battens notched into or nailed on their edges. Precision and stability are nevertheless equally and absolutely necessary, as it is impossible for an arch to be turned or set correctly on an incorrect or unstable centre. The timbers or frame-work of floors is called naked floor-

ing, and it is distinguished as single, double, and framed.

Of these the first, under ordinary circumstances, is the strongest. Single flooring (See No. 1 and 2, fig. 29) consists of one row or tier of joists alone, bearing from one wall or partition to another, without any intermediate support, receiving the flooring boards on the upper surface or edges of the joists, and the ceiling, if there be one, on the lower. Joists in single floors should never be less than two inches in thickness, because of their liability to be split by the brads or nails of the boards if they are thinner; and they should never be much more, because of the keying of the ceiling, which is injuriously affected by great thickness of the joists. Twelve inches from joist to joist is the distance generally allowed; that dimension, however, from centre to centre of the joists would be better. Strength to

almost any extent may be given by adding to the depth of the joists, and diminishing the distance between them; and

they may be made firm, and be prevented from buckling or

twisting, by putting struts between them. These struts are short pieces of batten, which should not be less than an inch, and need not be more than an inch and a half thick, and three or four inches wide,

placed diagonally between the joists, to which they are nailed, in a double series, or crossing, as indicated by the full and dotted lines in the diagram, fig. 26; and they should be made to range in a right line, that none of their effect may be lost; and these ranges or rows should be repeated at intervals not exceeding five or six feet. The struts should be cut at the ends with exactly the same inclination or bevel, to fit closely. Great care should be taken, too, not to split the struts in nailing; but the trouble of boring with a gimlet is saved by making a slight nick or incision with a wide-set saw for each nail, of which there should not be less than two at each end; and the nails used

should be clasp-nails. If the struts were notched into the joists, it would add very materially to their efficiency, but perhaps not in proportion to the additional labour it would involve. This strutting should be done to

single flooring under any circumstances, as it adds materially to its firmness, and indeed to its strength, by making the joists transmit any stress or pressure from one to another. The efficiency of single flooring is materially affected by the necessity which constantly occurs in practice of trimming round fire-places and flues, and across vacuities. Trimming is a mode of supporting the end of a joist by tenoning it into a piece of timber crossing it, and called a trimmer, instead of running it on or into the wall which supports the ends of the other joists generally. A trimmer requires for the most part to be carried or supported at one or both of its ends by some of the joists, which are called trimming joists, and are necessarily made stouter than if they had to bear no more than their own share of the stress. Commonly it is found enough to make the trimmers and

trimming joists from half an inch . n inch thicker than Building. common joists. In trimming, tusk tenons should be used; and the long tongue or main body of the tenon should run not less than two inches through, and be draw-pinned, and wedged, moreover, if it do not completely fill the mortise in the direction of the length of the latter. The principal objection, however, to single flooring is, that sound readily passes through, the attachment of the boards above and of the ceiling below being to the same joints throughout. Another objection, and one already referred to, is the necessity of making the joists so thin, not to injure the ceilings, that they with difficulty receive the flooring brads in their upper edges without splitting. A partial remedy for both these disadvantages is found in a mode sometimes adopted of making every third or fourth joist an inch or an inch and a half deeper than the intervening joists; and to these, ceiling joists are notched and nailed, or nailed alone, as shown in the diagram, fig. 26. This, by diminishing the number of points of contact between the upper and lower surface, for the ceiling joists must be carefully kept from touching the shallower joists of the floor, is less apt to convey sound from one story to another, and allows conveniently thin joists to be used for the ceiling without affecting those of the floor.

Double flooring (see sections No. 1 and 2, fig. 27, and plan No. 3, fig. 29) consists of three distinct series of joists, which are called binding, bridging, and ceiling joists. The binders in this are the real support of the floor; they run from wall to wall, and carry the bridging joists above and the ceiling joists below them. Binders need not be less and should not be much more than six feet apart, that is, if the bridging or flooring joists are not inordinately weak. The bridging joists form the upper tier, and are notched down on the binders with the notch shown at No. 5, fig. 21. The ceiling joists range under the binders, and are notched and nailed as shown at No. 1, fig. 27; but the notch must be taken entirely out of the ceiling joists, for the lower face or edge of the binder may not be wounded by any means or on any account, and moreover no good would be gained in any other respect by doing so. When it is an object to save height in the depth or thickness of this species of floor, the ceiling joists may be tenoned into the binders, instead of being nailed on to them; in this case the latter must be chase-mortised on one side, for the convenience of receiving the former when they are themselves set and fixed. A chase is a long wedge-formed groove of the breadth or thickness of the mortise, of which it is indeed an elonga-

tion, so that the tenon at one end of a ceiling joist being inserted in the regular mortise in the binder prepared for it, that

at the other end is driven along the chase up to its place in the mortise in the next binder. When ceiling joists are thus chase-mortised, their lower or under faces are allowed to come a little below the under face of the binders, and the space across is firred down by slips not wider than the ceiling joists are thick. No. 2, fig. 27, shows a transverse compartment, or bay, of a floor in this manner; but it is not so good a one as the preceding; for, besides weakening the binders, by cutting so many mortises and chases in them, it is almost impossible to give the ceiling floor the degree of firmness and consistency it possesses in the other way, besides requiring the firring down on the binders. The same space would be better gained by cutting the bridging joists so much lower down; as they may, with the sort of notch indicated above, be let down fully half their depth without great injury to either bridging joists or binder, for they can always be made to fit tightly or firmly, and very little more labour is involved in notching deeply than slightly.

Flooring is said to be framed when girders are used to-

Building, gether with binding, bridging, and ceiling joists. (See sec- the tendency the part or thing to be supported has in one Building. tions No. 1 and 2, fig. 28, and plan No. 4, fig. 29.) Girders are large beams, in one or more pieces, according to the length required, and the size and strength of which timber can be procured. They are intended for longer bearings than mere binders may be trusted at, and may be strengthened to almost any extent by trussing; but to be efficient, the height of the truss must always be greater than the depth of the beam itself, and the strength is increased by extending that height as the space or bearing increases. A truss is indeed a wooden arch, whose lateral thrust will of course be greater the smaller the angle subtended by it, and vice versa. It has been a commonly received opinion, that a truss within the depth of a girder adds materially to its strength; but experiments have proved that very little advantage is gained by such a one when executed in the best manner, and that, badly executed, the beam or girder is weaker with the truss than without it. Binders are made dependent on the girders by means of double tusk tenons, and on and to them the bridging and ceiling joists are attached in the manner before described. No. 1, fig. 28, shows the transverse section of a compartment or bay of a framed floor; No. 2 the same longitudinally of the girder, and of the bridging and ceiling joists, and transversely of the binders. No. 1, fig. 29, is the plan of a single floor of joists tailing in on wall-plates with two chains of struts, and trimmed to a fire-place. No. 2 is a floor similar to No. 1, with ceiling joists nailed to deeper flooring joists at intervals, as shown in fig. 26. No. 3 is the plan of a double floor; and No. 4 is that of a framed floor of joists, bays of which are shown in section at figs. 27 and 28. It is to be observed, however, with reference to the diagram No. 1, fig. 28, that binders ought not to be framed into the girders opposite to one another, as they are here shown to be as a matter of convenience, since the girder is unduly weakened by being mortised on both sides at the same place. Castiron shoes render mortising the one forming a tenon upon the other almost unnecessary; and in like manner cast-iron shoes laid into a wall upon stone tem-plates give a good and safe bearing to the girders; but it is not everywhere that cast-iron shoes are attainable, and mortises and tenons may be made anywhere.

Partitions of timber are called quartering partitions, and they are generally framed. Common quartering partitions which rest on a wall or floor, and have nothing to carry, consist merely of a sill, a head, and common uprights to receive the lath for plastering: these last may be simply joggled or tenoned into the head and sill, in the manner shown at c, fig. 23, and stiffened by struts or stretching pieces put between them and nailed. When, however, a quartering partition is over a vacuity, or rests only on certain points, and has, moreover, to sustain a weight, a floor perchance, it is framed and trussed with king or queen posts and trussing picces as to the tie beam of a roof; and the filling in of common uprights or quarters for the laths is generally performed by joggling them at one end into either head or sill, and nailing them securely to the trussing pieces. In the diagram No. 1, fig. 30, it is supposed that an opening or doorway is to be made in the partition, so that the timbers of the truss are placed around it with queen-posts, and a small internal truss is put over the door-head to prevent it from sagging, and to carry the long part of the partition, which we supposed required to bear a floor, so that the partition acts also, in fact, the part of a trussed girder in the most available form. No. 2 presents another method of framing a similar partition.

Shoring or propping up walls or floors, or it may be a whole building, is done by the carpenter. In appearance it is a simple operation, and under ordinary circumstances it really is so; but nevertheless it often demands the exercise

direction or another.

Pugging floors, firring down joists, and bracketing and cradling for plastering, and some other things, are operations performed indifferently by the carpenter or the joiner, as less or greater precision is required in the performance.

The labour of carpenter's work is valued by the square of one hundred superficial feet whenever it will admit of being so measured, and the timber is as generally valued by the cubic foot. It is customary for the carpenter's work to be measured at the same time with the walls and roof covering, or when the carcass of a building is completed, and before the joiner and plasterer commence their operations; for then the work is still exposed, and may be fully and correctly ascertained, whereas much must be taken on trust if the measurement be deferred until the works are completely finished.

Bond timber, wood bricks, and wall and tem-plates, are taken under the same head, and are reduced to cubic feet of timber at so much per foot, including the labour of every kind on it. The naked flooring is taken on the surface from wall to wall, with a description of the nature of it, whether it be single, double, or framed-if trimmed to chimneys, party walls, stairs, or anything else—if notched or cogged to wall-plates and partition heads—the number and size of the large timbers, ceiling joists as notched and nailed to wall-plates, and as framed or notched and nailed to binders or common joists; and everything indeed that affects the quantity of labour required in forming it. The superficial feet are reduced to squares for the labour and nails involved and used in forming and fixing or setting the floors. The timbers of which the flooring is composed are then taken in detail and in cubic quantities, and are said to be without labour, or with no labour. Roofing is measured in the same manner, by the superficial square, for labour and nails, taken on the common rafters from ridge to heel; the length of a rafter by the length of the roof for one side of a common span, and repeated or doubled for the other, noting also a description of the roof, whether it be lean-to or shed roofing, if on purlines and with struts; common span-roofing; curb roofing; span roofing with purlines and collar beams, strutted or otherwise, from walls or partitions; span roofing with framed principals, tie-beams, king-posts or queen-posts, straining beam, straining sill, struts, purlines, pole-plates, and so on or as the case may be, and this too for labour and nails. All the timbers are then taken, measuring every one to the extent of any tenon or tenons at its ends, in cubic quantities also, and as without labour. Bolts, bars, straps, stirrups, &c. are taken separately, and their dimensions noted from which to ascertain their weight. Gutter-boards and bearers are measured and valued by the foot superficial, according to thickness of the former. Rough boarding for lead on flats, and sound boarding for slates or lead, are taken superficially, and reduced into squares. Centring to vaults is measured on the periphery of the arch, or round back of the centre, for the breadth, by the length, and is valued by the square; to apertures in the thickness of walls, by the foot, and to camber-arches, by number, so much a piece. Quartering partitions are measured by the square for labour and nails, and the material is taken by the cubic foot. Battening to walls is also measured by the square, but the stuff is generally included with the labour, as in boarding. Cradling and bracketing is valued by the foot superficial, and with reference to the quantity of stuff required or worked up. Any planing that may have been necessary, and it will happen at times on beams, joists, &c. when it is not intended to have a ceiling under the floor, is charged by the foot on the surface, and any beading or other moulding by the foot

It sometimes happens that a superficial quantity for labour of considerable skill and tact to determine and to counteract and nails on framed timber cannot be obtained; in that case

Building. the timoer is measured by the cubic foot as framed, or with the labour of framing included with its own cost, &c. In this case, however, it is necessary to make a distinction between one quantity and another, as the labour employed upon an equal quantity of stuff in framing some parts of a roof is much greater than is required in most floors. Many things, such as strong door and window frames, that are to be worked into the walls, story-posts, brestsummers, &c. are always taken as framed timber, with any addition that may occur of wrought, rebated, beaded, &c., as the case may be.

> The price or value to be attached to the varieties of carpenter's work depends almost as much on the degree of hardness of the timber employed, as on its cost. What the timber itself should be charged at may be thus determined. To its price in the gross at the timber merchant's must be added the cost of carriage to the spot where it is to be employed, which will be so much the load of fifty cubic feet, or so much per foot; then to the cost of each cubic foot of timber add the price of four superficial feet of sawing, which will form a fair average for the variously sized scantlings, and one-eighth of the increased amount to it as an allowance for waste in cutting up and working. This gives the actual cost, to the builder, of the timber as it is worked up; and if it is to be charged as with no labour, his profit and remuneration for his own labour of superintending, &c., alone remain to be included. If, however, labour of any kind is to be charged with the stuff, it should be added first, and the builder's profit, &c., taken on both, or on the increased amount for the price per foot. The cost of labour depends so much upon such a variety of circumstances, that it is impossible to aid the inquirer materially in apportioning prices for the various operations. In this, as in other things, it is well, when the parties are not otherwise qualified to determine a scale of charges, to observe the time a man or a certain number of men are employed in executing so much work of a certain description, and compare the quantity by measurement with the time employed in executing it, or rather with the wages of the workmen for the time. In fixing a price for labour in carpenter's work, the size of the timbers, and the heights they have to be hoisted, together with such scaffolding and machinery for hoisting as may be found necessary, if the timbers be heavy, and the height and expense great, must be considered. As the timber used in shoring is not consumed, a charge is made for use and waste to the amount of one-third of its value if it be much cut up, and one-fourth if but little, in addition to the labour of setting up and taking down, whatever that may be.

> Joiner.—The principles of joinery also will be found in an article under that head in another part of this work; here we have merely to do with the modes of operation, and the tools employed by the workman, together with the manner of estimating or ascertaining the value of his work.

> The distinction between the operations of the carpenter and the joiner is shown at the beginning of the preceding section on the trade of the former. A man may be a good carpenter without being a joiner at all; but he cannot be a joiner without being competent, at least, to all the operations required in carpentry. It is, indeed, very truly remarked in the article Joinery, "that the rough labour of the carpenter renders him in some degree unfit to produce that accurate and neat work-manship which is expected from a modern joiner;" but it is no less true that the habit of neatness and the great precision of the joiner, make him a much slower and less profitable workman than the practised carpenter, in works of carpentry.

The joiner operates on battens, boards, and planks, with saws, planes, chisels, gouges, hatchet, adze, gimblets, and other boring instruments, which are aided and directed by chalked lines, gauges, squares, hammers, mallets, and a great many other less important tools: and his operations are principally sawing and planing in all their extensive varieties, setting out, mortising, dovetailing, &c. A great range of other operations, none of which can be called unimportant, such as paring,

gluing up, wedging, pinning, fixing, fitting, and hanging, and Building, many things besides which depend on nailing, &c., such as laying floors, boarding ceilings, wainscotting walls, bracketing, cradling, flering, and the like. In addition to the wood on which the joiner works, he requires also glue, nails, brads, screws, and hinges, and accessorily he applies bolts, locks, bars, and other fastenings, together with pulleys, lines, weights, white-lead, hold-fasts, wall-hooks, &c. &c.

Battens are narrow boards running from half an inch to an inch and a half or two inches thick, and from three to six or seven inches wide. A piece of stuff of too small a scantling to be a batten is called a fillet. The term board is applied to sawed stuff when its width exceeds that of a batten, and its thickness does not exceed two inches or two inches and a half. The term plank is applied to large pieces of stuff whose width is great in proportion to their thickness, and whose thickness nevertheless does not exceed three or four In London these terms are used in much more restricted senses than they are here described to mean, because of the fixed and regular sizes and forms in which stuff for the joiner's use is for the most part brought to market there. A batten, to a London joiner, is a fine flooring board from an inch to an inch and a half in thickness, and just seven inches wide. A board is a piece cut from the thickness of a deal whose width is exactly nine inches; and everything, almost above that width, and not large enough to be called a scantling of timber, is a plank.

The joiners' work for a house is for the most part prepared at the shop, where every convenience may be supposed to exist for doing everything in the best and readiest manner; so that little remains to be done when the carcass is ready, but fit, fix, and hang, that is, after the floors are laid. The sashes and frames, the shutters, back flaps, backs, backs and elbows, soffits, grounds, doors, &c., are all framed and put together, that is, wedged up and cleaned off, at the shop; the flooring boards are prepared, that is, faced, shot, and gauged with a fillister rebate; and all the architraves, pilasters, jamb linings, skirtings, mouldings, &c., are all got out, that is, tried up, re-

bated, and moulded, at the shop.

When the carcass of a building is ready for the joiner, the first thing to be done is to cut the bond timber out of the openings, set the sash frames, and fill them with old sashes or with oiled paper on frames, to exclude the weather, but admit light. The flooring joists are then proved with straight-edges, and any inequalities in them are removed with the adze; the flooring boards are next cut down to their places, and they are turned with their faces downwards until the ceilings are done; but first the pugging floors, if any are intended, are formed, and the pugged clay is put in on them. Floors are in ordinary cases either straight joint or folding, and are edge or face nailed. Folding floors are those in which three, four, or five boards are laid at a time, with their heading joints all on the same joist, and of course in the same straight line. In laying them, one board being firmly nailed to the joists at the extremity of the floor, another is laid parallel to it at the distance of the width of three or four others, or rather within their width, and these are then forced down and nailed, the forcing having brought all the joints up close. This is a bad mode, however, and should never been used. Straight joint flooring is when every board is laid separately, or one at a time, the heading joint or joints being broken or covered regularly in every case. Straight joint flooring may be with square joints, when it is entirely face nailed, or it may be dowelled or tongued, when it is side or edge nailed only. Dowelling is the driving pins of wood or iron half their length, into the edge of the last laid board, the outer edge of which has been skew-nailed, their other ends running into holes prepared for them in the inner edge of the next board, in the way the head of a cask is held together, and then its outer edge is skew-nailed in the same manner, and so on. Tongueing is effected by grooving both edges of every board, and fitting thin slips and tongues into them, as described in the article Joinery. The boards are forced together by pressure applied to the outer edge. The nail used in face-nailing floors is called a flooring brad; it has no head, but a mere tongue projecting on one side of the top of the nail, which is put in the direction of the grain, that it may admit of being punched in below the surface level, otherwise the superficial inequalities could not be reduced when the floor was completed, because of the proBuilding. jecting heads of the nails. For side or edge nailing, however, clasp-nails, nails whose heads extend across on two of the opposite sides, are used.

Another early operation the joiner has to attend to, is the fixing of the framed door and window and the narrow skirting Plate CXI. grounds (see fig. 35) to which the plasterers may float their work. The skirting grounds are generally dovetailed at the angles, and are well blocked out, so that they may not vibrate on being struck, or yield to pressure when the plasterer's straight-edge passes roughly over their surface; they must also be set with the utmost truth and precision. When the floors are cut down and the grounds fixed, the joiner's operations in a building should be suspended until the plasterers have finished, or nearly so, and then the floors may be laid. By deferring this operation until that period, the workmen of the two different trades are prevented from interrupting each other, and indeed injuring each other's work; and joiners always find employment in the shop preparing, as before intimated.

The preparation flooring boards receive, is planing on the face, shooting on the edges, and gauging to a thickness; the common fillister, or stop rebate plane, being used to work down to the gauge mark, from the back of every board, and about half an inch in on each edge. When a board is to be laid, it is turned on its face in the place it is to occupy, and the workman with his adze cuts away from the back over every joist down to the gauge rebate, so that on being turned over it falls exactly into its place, and takes the same level with all its fellows, which have been brought to the same gauge; then follows the process of laying as before described, and the result must, if the work be done well, be a perfectly even and level surface. The slight inequalities of surface which may occur are reduced with a smoothing-plane, the brads being previously punched below the surface if the floor be face-nailed. See the article Joinery, sections 35 and 36.

In getting out skirtings, if the work be of a superior description, the boards should be tried up as if for framing in every particular except bringing to a width, which need not be done. The face edges, however, must be worked with great precision, and moulded or rebated as the case may require. Rebating or tongueing will be necessary when the skirting consists of more than one piece, that the different pieces may be made to fit neatly and firmly together; and all but the lowest piece must of necessity be brought to a width, as well as tried up in other particulars. A skirting in a single width is called by that term; but when it is made up of more than one part it is designated a base: the lowest board is then called the skirting board, and the upper the base moulding or mouldings. (Figs. 31 and 35.) The reason why the skirting board is not brought to a width is, that the labour would be lost according to the ordinary mode of fixing it. The board is applied to its place with its lower edge touching the floor; but as the most perfectly wrought floors are found to have some slight unevenness of surface so close to the wall, a straight edge would not fit closely down to it in every part. The board is therefore propped up at one end or the other until the upper or faced edge is perfectly parallel with the average line of the floor, or rather to be perfectly level. A pair of strong compasses, such as those used by the carpenter, is taken, and opened to the greatest distance the lower edge of the skirting board is from the floor throughout its length; the outer edge, near the point of one leg of the compasses, is then drawn along the floor, whilst the point of the other, being kept vertically above it, is pressed against the face of the board, on which it marks a line exactly parallel to the surface of the floor, indicating, of course, every, even the slightest irregularity there may be in it. If the floor be not a very uneven one, the excluded part may be ripped off with the hand or the panel saw, which may generally be made to follow the traced or inscribed line exactly; if, however, the line be a very irregular one, having quick turns in it, the hatchet must be used. This operation is called *scribing*, and the result of it is evidently to make the skirting fit down on the floor with the utmost precision. Care must be taken, in performing the operation, that the upper edges of the skirtings be not only level, but that all which are in immediate connection be scribed to the same height, that their upper edges may exactly correspond. Sometimes skirtings are let into a groove in the floor, as indicated in the diagram, fig. 35, and thus a slight degree

of shrinking is made of less importance, and scribing rendered Building. unnecessary. Before skirtings are fixed, vertical blocks are put at short intervals, extending from the floor to the narrow grounds, and made exactly flush with and true to the latter, and are firmly nailed. These form a sound backing, to which the skirtings may be bradded or nailed; and so prevent them from warping or bending in any manner. If, however, the skirting be not very wide, and be sufficiently stout to stand without a backing, a fillet only is nailed along the floor as a stop for its lower edge; but this is rendered unnecessary if the skirting be tongued into the floor, as the tongue will answer every purpose of a stop. The ends of skirtings should be tongued into each other when it is necessary to piece them in length; and on returns or angles the end of one should be tongued into the returned face of the other in the square parts, and mitred in the oblique-angled or moulded

When a chair-rail or surbase is required, grounds similar to those for the base are fixed to range like them with the face of the plastering; the surbase itself must be wide enough to cover the grounds and the joints formed by them and the plastering, completely; it is in effect a cornice to the stereobate and the space intervening it and the base is generally understood to be wainscotted, though it is more frequently plastered.

In framing or framed work, the outer vertical bars which are mortised are called styles; and the transverse, those on whose ends the tenons are formed, are called rails. (Fig. 32.) In doors, particularly, the open spaces or squares formed internally by the rails and styles are divided in the width by bars parallel to the styles. These are tenoned into the rails, and are called mountings, or, vulgarly, muntins. The frame being formed by trying up, setting up, mortising, and tenoning, the inner or face edges of the styles, and of the highest and lowest rails, and both edges of the muntins and of the inner rails, are grooved with the plough to receive the edges and ends of the filling-in parts, or panels of the frame-work. Panels are either flat, raised, or flush. (Fig. 33.) Flat panels are no thicker than the grooves into which they are fitted, and consequently their faces are as much below the surface of the framing as the groove is in from each side of the styles and rails. Raised panels are thicker than the groove in the framing, but are not so thick as to reach the surface; nor is the panel thickened through its whole extent. It fits exactly into the groove, and thickens gradually for an inch or two, and then sets off at a right angle with the surface, increasing suddenly three or four sixteenths of an inch. A panel may be raised on one side only, or on both sides. Flush panels are rebated down from one face to the distance the plough groove is in from the surface of the framing; and the back of a panel thus rebated on one side is worked down to be even with the other edge of the groove. leaving a tongue to fit it exactly; for if it be required to make panels flush on both sides, it is generally effected by filling in on the back or flattened side with an extraneous piece. Framing is not, however, often finished in the manner above described, especially with raised and flush panels; mouldings are generally introduced, and are either struck or worked in the solid substance of the framing, or in separate pieces or slips, and laid in with brads. If a moulding be struck or laid in on one side only, and the other is left plain, the framing is described as moulded and square, a flat panel being in that case understood; if the panel be raised the framing will be described as moulded with a raised panel on one side, and square or flush on the other. It may be moulded with a flat panel, or moulded with a raised panel, on both sides; and the moulding may, as before intimated, be either struck in the solid, or laid in any of the preceding cases. Mouldings which are laid in round the panels of framing are neatly mitred at the angles, and bradded, to appear as much as possible as if they were struck in the solid. In nailing or bradding the mouldings, the brads should be driven into the frame-work, and not into the panels. With a flush panel, however, the moulding is always either a bead, or a series of beads called reeds: and is, in the case of a single bead, which is most common, always struck on the solid frame, and the work is called bead-flush; but reeds are generally struck on the panel in the direction of the grain, and laid in on the panel across it, or along the ends; this is termed reed-flush. Flush panels in inferior works have a single bead struck on their

Building. sides in the direction of the grain alone, the ends abutting plainly, as in the first diagram of a flush panel, and this is termed bead-butt, the fact that the panels are flush being in-The plainest quality of framing, in which it is square on both sides, is used in the fittings of inferior bed-rooms, inner closets, and the plainer domestic offices, but always internally; framing moulded on one or both sides, in rooms and places of a greater degree of importance, and in places where the work may be more generally seen; in some cases a flat panel may be enriched by a small moulding laid on its surface, leaving a margin between it and the larger moulding at its extremities; this may be done in drawing-rooms and apartments of that class, especially if they be in an upper story; and raised panels should be confined to the framed fittings of dining-rooms and other apartments on a ground or principal story. Framing with flush panels is almost restricted to external doors, &c., one side of a door being bead-flush, and the other flat and moulded, perhaps, or the face may be moulded with a raised panel, and the back-bead flush; and this for principal entrances. Bead-butt framing is found in external doors to offices, &c. Doors are made four-panelled for the most part when the panels are flat and the framing square, six-panelled when the latter is moulded. and six, eight, or even ten panelled when the framing is of the superior descriptions. Doors which are hung in two equal widths to occupy the doorway, and are hung to the opposite side posts or jambs of the frame, are said to be double-margined; that is, the styles or margins are repeated necessarily in the middle where they meet. Doorways are fitted with jamb linings, and architraves or pilasters. Jamb linings may be framed to correspond with the door on the outer faces; and when they exceed nine or ten inches in width they should always be so, or they may be solid. Narrow and plain jamb linings to inferior rooms are rebated on one side only, and the rebate forms the frame into which the door is fitted. To superior work they are rebated on both sides, as if it were intended to put a door on each side. The jambs are fixed to the inner edges of the grounds; and if they are wide, and not framed, backings are put across to stiffen them; and these backings are dovetailed into the edges of the grounds. Architraves and pilasters are variously sunk and moulded, according to the fancy of the designer. They are fixed to the grounds with their internal edges exactly fitting to the rebates in the jambs, and they form the enriched margin or moulding of the frame in which the door is set. Architraves are mitred at the upper angle, but pilasters have generally a console or an enriched block or cap resting on them, to which they fit with a square joint; both the one and the other either run down and are scribed to the floor, or rest on squared blocks or bases, which may be the height of the skirting board, or of the whole base.

The parts of the outside frame of a sash are distinguished by the terms applied to the similar parts of common framing. The upright sides are styles, and the transverse or horizontal ones, which are tenoned into the ends of the styles, are rails; but the inner frame-work or divisions for the panes are called merely upright and cross bars; the upright being the mortised, and the cross bars the tenoned, nevertheless, as with the outer frame-work. (Fig. 31.) Sashes are got out like common framing; the parts are tried up, set out, mortised and tenoned, exactly in the same manner, allowance being made in the length of the rails and all tenoned pieces, in the setting out, as in common framing also, for the portions of the mortised styles and upright bars, which are worked away in forming the moulding and rebate. The meeting rails of sashes which are in pairs, to be hung with lines, are made thicker than the other parts by the thickness of the parting bead, and they are bevelled or splayed off, the one from above and the other from below, that they may meet and fit closely. When the framework is completed, although it cannot be put together because of what has just been referred to, the rebate is formed by the sash fillister on the further part of the face edge, and the moulding struck on its hither angle. These things being done, the moulded edges are either mitred or scribed at the shoulders and haunches, and the sash may be put together. If sash bars are mitred at the joints, they require dowels in the cross bars to act as tenons; but if they can be scribed, dowelling is not necessary. Sashes are either hung upon hinges or hung with lines, pulleys, and weights. Fixed sashes are put into frames, of which every part may be solid but the stop, which must be

put in behind the sash to detain it. Sashes hung with hinges Building. require solid rebated frames; but there can be no stops to them except their own moveable fastenings, and the outer stop, which of course the rebate furnishes. Sashes hung with lines require cased frames to receive the pulleys and weights. The sill of the frame is made, as in the former cases, solid, is sunk and weathered, and is generally made of a more durable material than the rest of the frame; the sides in the direction of the thickness of the frame are of one and a quarter or one and a half inch board, very truly tried up, and grooved to receive a parting bead; for it must be obvious that sashes hung with lines to run vertically up and down within the height of the frame must be themselves in two heights, and must pass each other in two separate and distinct channels. The ends of these boards are fixed into the upper face of the solid sill below, and into a similar board parallel to the sill which forms a head above; and they are called pulley pieces, or styles, because they receive the pulleys, which are let into them near their upper ends. Linings from four to six inches in width, and from three-fourths of an inch to an inch in thickness, are nailed on to the edges of the pulley pieces, and to the sill and head above and below, inside and outside in the direction of the breadth of the sash frame, and are returned along the head in the direction of its length. The outside linings are made to extend within the pulley pieces about half an inch, to form a stop for the upper and outer sash; and the inside linings are made exactly flush with their inner faces. The casing is completed by fixing thin linings on to the outer edges of the outside and inside linings, parallel to the pulley pieces, to prevent any thing from impeding the weights. Thin slips called parting beads are fitted tightly into the grooves previously noticed in the pulley pieces, but they are not fixed, as the upper sash can be put in or taken out only by the temporary removal of the parting bead. An inner or stop bead is mitred round on the inside to complete the groove or channel for the lower sash; the stop bead covers the edge of the inside linings on the sides and head, and is fixed by means of screws, which may be removed without violence when it is required to put in or take out the sashes. A hole covered with a moveable piece, large enough to allow the lead or iron weight to pass in and out, is made in each of the pulley pieces, so that the sashes may be hung after the frames are set, and to repair any accident that may occur to the hangings in after-use. (Fig. 34.) It may be here remarked, that sash-frames require greater truth and precision from the workman than anything else in the joiners' work of a building; and unless the stuff employed be quite sound and perfectly seasoned, all the workman's care in operating will be thrown away. The fittings of a window which has boxed shutters consist of back linings, grounds, back, elbows and soffit, together with shutters and back flaps, and architraves or pilasters round on the inside to form a moulded frame. (Figs. 31 and 34.) Backlinings are generally framed with flush panels; they fit in between the inside lining of the sash frame and the framed ground, to both of which they are attached, and form the back of the boxing into which the shutters fall back. They are tongued into the inside lining by their inner edge, and on their outer edge the ground is nailed, and they are set at right angles to the sash-frame, or obtusely outwards, as the shutters may be splayed or not. The back is the continuation of the window fittings from the sash-sill to the floor on the inside; the elbows are its returns on either side under the shutters, and the soffit is the piece of framing which extends from one side of the window to the other, across the head, or from back lining to back lining. These are all framed to correspond with the shutters on the face; but, as they are fixed, their backs are left unwrought. Window shutters are framed in correspondence with the door and other framed work of the room to which they belong, in front, and generally with a flush panel behind: the back flaps are in one or two separate breadths to each shutter, according to the width of the window and the depth of the recess; they are made lighter than the shutters themselves; and they should, when shut to, present faces exactly corresponding with those of the shutters, both internally and externally. The shutters are hung to the sash-frame with butt hinges, and the back flaps are hung to their outer styles with a hinge called a back-flap, from its use. The shutters and their back flaps are hung in one, two, or more heights, as may be found convenient. moulded margin round the boxings of a window on the inner

Building. face are made to harmonize generally with the similar parts of the doors of the room or place to which it belongs. The fixing and hanging of window fittings or dressings are hardly less important, for the accuracy required, than the making and fixing of the sash-frame itself; the slightest infirmity or inaccuracy in any part will be likely to derange some essential operation. Sashes, it may be remarked, are never fitted until the frames are immoveably fixed, so that if there be any inaccuracy in the latter, the sashes are cut away or pieced out to make them fit; but, as they are intended to traverse, the fitting in that case can only apply to one particular position, and in every one but that there must be something wrong. Any incorrectness in the sash-frame, again, must throw the shutters and their back flaps out; indeed the sash-frame, though apparently a secondary part of the arrangement, is that which affects all the rest beyond anything else. When sashes have been fitted, a plough groove, wide and deep enough to receive the sash-line, is made in the outer edges of the styles, for about two-thirds of their length, at their upper ends. They are then primed and glazed, and when the putty is sufficiently set the joiner hangs them. He is furnished with sash-line, tacks, and iron or lead weights, which are generally made cylindrical, with a ring at one end, to which the line may be attached. A sash is weighed, and two weights are selected which together amount to within a few ounces of a counterpoise. The line is then passed through the pulley, which was previously fixed in the pulley style; the end is knotted to a weight which is passed in at the hole left for the purpose, and at a sufficient distance, which a common degree of intelligence will readily determine; the line is cut off and the end tacked into the groove in the style of the sash.

Glue is used principally in putting framed work together, but not at all in fixing; and even for the former purpose it is much less used by good workmen than by bungling hands. When the stuff is well seasoned, and the trying up, setting out, mortising, and tenoning, are well and accurately executed, there is no necessity for glue on the tenons and shoulders; the wedges alone need be glued, to attach them to the sides of the tenons, that their effect may not depend on mere compression. Joiners are generally furnished with a cramp, with which to force the joints of framing into close contact; it is either of wood acting by means of wedges, or of iron with a screw. too, is unnecessary with good work, every joint of which may be brought perfectly close without great violence of any kind. The cramp will sometimes give bad work the semblance of good, but it cannot make it really so. If any cracking and starting be heard in the joiner's work of a new building, it generally indicates one of two things; either the cramp has been required in putting the framing together, or, having been put together, it has been forced out of winding in fixing, and the constrained fibres are seeking to regain their natural position. A good workman does not require a cramp, nor will his work, if he has been supplied with seasoned stuff, ever require to be strained; and consequently the cracking and starting of joiner's work indicates unfit stuff or bad work, or perhaps both. It is true that glued joints will sometimes fly; but when they do, there need be no hesitation in determining the presence of both bad work, and stuff in an improper state.

Floors are measured and valued by the square of a hundred superficial feet; but anything beyond the mere flooring, such as the mitred borders generally put as a margin to the stone slab of a fire-place, is taken extra by the foot superficial, or running, as the additional work may be above or below three inches in width. The first important thing to note in measuring a floor is the thickness of the boards, by which to determine the cost of the principal material. A floor of boards unplaned on the face, and shot on the edges, laid folding, is the roughest that can be supposed; with the boards wrought or planed on the face, and laid in the same manner, will be the next in advance; and straight-joint flooring, in all its varieties, is the most troublesome, and consequently the most expensive in common and general use. Whether the boards be wide or narrow is a consideration to be noted, an equal surface being of course more rapidly covered with wide than with narrow boards; whether they be gauged, and if brought to a thickness throughout, or only rebate gauged, and cut down on the joints with the adze; in what manner the heading joints are formed and secured; how the longitudinal joints are executed, whether square, ploughed and tongued, or dowelled;

and whether the boards are face or edge nailed. Solid frames, Building as for outside doors, &c., are measured and valued by the cubic foot, labour being calculated upon the stuff according to the nature and extent of what may have been applied to it.

With trifling and unimportant exceptions, everything else in joiners' work that exceeds three inches in width is taken by the superficial foot; and the dimensions are taken on the finished and fixed work, so that allowances must be made for whatever waste may have been of necessity made. The stuff worked up by the joiner is always supposed to have been in planks and boards a certain number of quarters of an inch in thickness, so that whatever the finished work may stand, it is taken as of the thickness which in quarters of an inch it is next below; thus, if the styles of a door stand at even less than an inch and seven-eighths, it is taken as a two-inch door; for a piece of framing is always considered to be of the thickness of its outer frame-work, the description determining the substance of the panels. Framed grounds are measured round on the outside for the length; their width is not that of the frame, but of the styles and head as they actually are; and their thickness that of the stuff before it was planed at all. Narrow grounds are taken by the foot running, their width being noted in the description of them. Jamb linings are measured to the full length they may be of by their width, the thickness being noted, together with a description of the work on them,-if they are single or double rebated, if framed, and in what manner, &c.

The dimensions of a door are generally taken within the rebates in which it is to hang, with its thickness and description noted,-as of four, six, or eight panels, moulded on one or both sides, with flat or raised panels, &c.; if it be doublemargined, that is stated, and the amount of the lap or rebate in their meeting styles is added to the width, to increase the superficies by so much. The hinges with which a door is hung, and the lock or other fastenings which may be on it, are taken, with a description of their sizes and qualities, immediately after the door itself. If sashes are in a solid frame they are taken alone, but sashes in cased frames are measured in and with the frames. To the clear height between the sill and the head, three inches are added for the thickness of the sill, and four inches for the depth of the case at the head, for the height; and to the width between the pulley-styles is added eight, nine, or ten inches, as the case may be, for the breadth of the casing on each side, for the width; these give the superficies of the sashes and frame. The sashes and frame are described, with the thickness of the former, which determines that of the latter; the sill is described as sunk or merely weathered; the pulley-styles as of such a thickness; the pulleys, line, and stuff employed in the different parts of the frame, as of such and such qualities and sorts; and whether the sashes be single or double hung, with what fastenings, &c. The boxings for the shutters are taken in a superficial quantity, as square or splayed, if circular on plan, whether with a flat or quick sweep, or if circular-headed, and straight on plan. The back linings, the backs, elbows, and soffits, the shutters and the back flaps, are all measured by the superficial foot, according to their thicknesses and descriptions, the hinges and fastenings of the shutters and back flaps being numbered and noted independently of them. The capping to backs is taken by the running foot; and elbow cappings are numbered. Moulded architraves are taken superficially, the length by their girt, or by the run at such a girt. Skirtings are measured superficially at such a thickness, as scribed or tongued, as square or moulded, or rebated for base moulding, as the case may be. Base and surbase, and indeed all other moulding which girds at four inches and above, should be taken superficially; and mouldings which are of less girt may be taken by the run if they be taken independently of the other work, or that to which they belong, at all. A moulding projecting from the face of the work to which it belongs may be assumed as independent of it; whereas a receding one, if it be small, will merely add the character of moulded to the work, and if large will qualify all in immediate connection with it to be taken as a superficial quantity of moulding. All circular work, or work which diverges from a straight line, is noted and charged proportionally to the additional labour and waste of stuff involved; the shorter the radius of the arc, or quicker the sweep, the higher must be the proportioned charge. Things which have been bent to their flected form are less costly in proportion than

Stairs are measured by the superficial foot, the length of one step being taken by the breadth of a step and riser, increased by once the thickness of the former for a quantity, and this multiplied by the number of steps there may be of the same kind; that is, when the steps are flyers; for in winding steps the treads and risers are taken in separate dimensions, for greater accuracy. The thicknesses of the steps and risers are noted, as well as the mode in which they are worked; they have either rounded or moulded nosings, are housed into the string, or have returned nosings, the riser being mitred to the string or to cut brackets on the ends of the steps. Curtail ends to steps are numbered. The frame-work or bearers on which the stairs rest is included with the stairs themselves. Stringboards are taken according to their thickness and the quantity of work on them; the grooves or housings in them are numbered. The capping on a close string is taken by the run; but when the nosings of the steps are returned, the strings are said to be cut; and if there are any cut and mitred blocks, they are numbered. Stair skirting is taken as raking and scribed, and as straight, circular, ramped, or wreathed, by the foot superficial; wooden balusters are taken by the run, and the mortises or dovetails in which they are set are numbered; newels are taken by the run for the stuff and the fixing, and the turnings on them are numbered. Hand-rails are said to be merely rounded, or moulded; they are measured by the running foot; and a distinction is kept up between the straight, the circular, the ramps, the wreaths, and the scroll; nuts and screws in their joints are numbered.

All sorts of framing, whether it be fixed or hung-all linings above three inches in width—all sorts of ledged work, such as plain doors and shutters, partitions in lofts and stables, bracketing, cradling, &c.—must be measured superficially. All narrow linings, very narrow skirtings, staff beads, fillets, water trunks and spouts, legs, rails, and runners to dressers, groovings, flutings, reedings, cappings, &c., and any work on superficial quantities that does not pervade the whole, but is in itself peculiar, should be taken lineally, or by the running foot. Insulated parts, such as short, interrupted grooves, blocks, pateras, brackets, trusses, cantilevers, holes, mortises for articles taken lineally, mitres to cornices, heads and feet to flutes and reeds, &c., are numbered and charged at so much a piece. Ironmongery goods employed by the joiner are numbered under their different heads, and charged as fixed; that is, to the price of a lock is added a charge for the labour employed in fitting and fixing it, and whatever accessories it may have required which are not included in its own cost, such as screws, &c., to a rim or dead lock. To the price of hinges, however, only the cost of screws should be added, as the fixing of them is usually included in hanging the work to which they are attached.

The cost at which joiners' work can be executed can only be determined by calculation and observation. The cost of the materials employed may be readily determined by dissecting a piece of work and reckoning its contents; but the labour depends on so many contingencies, that very accurate observa-tion indeed is necessary to determine the quantity that may have been required to produce a certain result. In carpenters' work, the material forms the principal part of the charge; but in joiners' work the materials are for the most part of far less importance than the labour which has been expended on them. The stuff employed in a sash must be costly indeed to amount to as much as the labour of making the sash; whereas, in most doors, under ordinary circumstances, the materials may cost as much as the labour.

Sawyer.—The labour of the sawyer is applied to the division of large pieces of timber or logs into forms and sizes to suit the purposes of the carpenter and joiner. His working place is called a saw-pit, and his almost only important tool a pit-saw. A cross-cut saw, axes, dogs, files, compasses, lines, lamp-black, black-lead, chalk, and a rule, are all accessories which may be considered necessary to him.

Unlike most other artificers, the sawyer can do absolutely nothing alone: sawyers are therefore always in pairs; one of the two stands on the work, and the other in the pit under it. The log or baulk of timber being carefully and firmly fixed on the pit, and lined for the cuts which are to be made in it, the top-man standing on it, and the pit-man below or off from its end, a cut is commenced, the former holding the saw with his

Building. those which must have been worked in the solid or glued up in thicknesses.

Stairs are measured by the superficial foot, the length of one

Stairs are measured by the superficial foot, the length of one winding with the line to be cut upon, and that of the pit-man to cut down in a truly vertical line. The saw being correctly to cut down in a truly vertical line. The saw being correctly entered, very little more is required than steadiness of hand and eye in keeping it correctly on throughout the whole length. It is the custom to project so much of the log over the first transverse bearer as can be done without rendering it liable to vibrate or be insecure; and when all the cuts proposed are advanced up to that bearer, the end is slightly raised to allow the bearer to be passed out beyond the termination of the advanced cuts. The advantage of, or rather the necessity for, the moveable handle at the lower end of the saw is now evident, the top-man removing the saw readily from cut to cut from above, his mate having merely to strike the wedge in the box one way or the other, to fix or loosen it.

It is absolutely necessary that the top-man should stand in such a manner on the log or piece operated on, that a line down the centre of his body should fall exactly upon the line of the cut he is to work on, and be as exactly perpendicular to it and to the plane of the horizon. He must, therefore, when the cut is near the outer edge, be provided with a board or plank, one end of which may rest on something firm at a short distance from the log, and the other on or against it, to put the outer foot on, and so keep himself in such a position that he may always, and without constraint, see his saw out of winding, and so that a spectator standing on the fore-end of the pit may see the saw an imaginary line passing down the centre of the work-man's body, and the line of the cut in exactly the same vertical plane. The labour of the top-sawyer should consist solely in lifting the saw up by the handle as high as his arms can carry it, and that of the pit-man in drawing it down with a slight pressure or tendency onward, sufficient to make it bite into the timber as much as his strength will enable him to make it out away. The only assistance the pit-man should give in lifting the saw, is in holding it back that the teeth may not drag against the cut in the ascent; and all the top-man should do in cutting downward is to keep the teeth steadily and firmly in contact with the part to be eroded. Good workmen may work with a narrower or closer set to their saw than bad ones can, though the wider or more open set saw is more liable to make bad work. It works more slowly and consumes more stuff than the close set; but it is not so likely to hang in the cut with unnecessary pushing up of the pit-man and jerking down of the other, as if it were set more closely. A good top-man, nevertheless, is of much more importance, though he be badly mated, than the converse. Indeed the best possible pit-man could not work satisfactorily with a bad top-man, and therefore the latter is always considered the superior workman, and on him devolves the care of sharpening and setting the saw, &c. In the operations of the carpenter and joiner much depends on the manner in which the sawyers have performed their part. The best work on the part of the carpenter cannot retrieve the radical defects in his materials from bad sawing; and although the joiner need not allow his work to suffer, bad sawing causes him great loss of stuff and immense additional and otherwise unnecessary labour. Planks or boards, and scantlings, on coming from the saw-pit, should be as straight and true in every particular, except mere smoothness of surface, as if they had been tried upon the joiner's bench; and good workmen actually produce them so. Saw-mills, too, by the truth and beauty with which they operate, show the sawyer what may be effected; for though he can hardly hope to equal their effect, he may seek to approach it.

Sawyers' work is valued at so much the hundred superficial feet; the sawing on a board or squared scantling being once its length, by a side and an edge, or half the amount of its four sides. In squared timber, however, it is generally valued at so much per load of fifty cubic feet, four cuts to the load, any cuts exceeding that number being paid for at so much per hundred feet; in this case the length of the cut by its depth rives the superficial quantity of sawing in it. Pieces again of determined and equal length and breadth, such as the deals and planks commonly used for joiners' work in this country, admitting of a regulated scale, the sawing that may be required in them is valued at so much the dozen cuts.

Modeller.—The modeller copies, in a solid material, the drawings of designs which may have been prepared for enrichments, in whatever material they are to be cast, whether in

Building. plaster, in metals, or in composition of any kind, for the plasterer, smith. or decorator. The model is made in a finely tempered and plastic clay, or in wax; and the modeller works with his fingers, assisted by a few ivory or bone tools for finishing off neatly and sharply, and for working in parts which he cannot reach with his fingers. He is generally the best workman who can do most towards producing the required forms with his fingers unassisted by artificial tools, as a greater degree of ease and freedom almost always results from the use of the hands alone. The model being completed, it is moulded, that is, moulds are made fitting it exactly in every part, and fitting exactly to each other at the edges, and in these, casts are made to any extent that may be required.

The modeller having some pretensions to be considered an artist rather than a mere artificer, is for the most part paid according to his merits as such, rather than for so much time, according to the ordinary mode of determining the value of

artificers' works.

Carver and Gilder .- The carver is strictly an independent artist, whose business it is to cut ornaments and enrichments in solid and durable material, such as wood and stone, so that, like the modeller, he must be paid according to the taste and power he may exhibit in his works, rather than as a common artificer. Carving has, however, been in a great measure superseded by modelling and casting, so that the carver is hardly known in economic building except in connection with the gilder. Gilding may indeed be applied to castings as well as to carvings; but the former being, almost as a matter of course, less sharp and spirited in their flexures and details, as well as less firm in substance than the latter, castings can less bear to be further subdued by the application of foreign matters to their surfaces than carvings may.

Gilding is the application of gold leaf to surfaces, which require, however, to be previously prepared for its reception. The work is first primed with a solution of boiled linseed oil and carbonate of lead, and then covered with a fine glutinous composition called gold size, on which, when it is nearly dry, the gold leaf is laid in narrow slips with a fine brush, and pressed down with a piece of cotton wool held in the fingers. As the slips must be made to overlap each other slightly, to insure the complete covering of the whole surface, the loose edges will remain unattached; these are readily struck off with a large sable or camel-hair brush, fitted for the purpose; and the joints, if the work be dexterously executed, will be invisible. This is called oil gilding, and it is by far the best fitted for the enrichment of surfaces in architecture, because it is durable, and is easily cleaned, and does not destroy or derange the forms under it so much as burnished gilding does. This latter requires the work to be covered with various laminæ of gluten, plaster, and bole, which last is mixed with gold size, to procure the adhesion of the leaf. The most durable mode of gilding metals in common use is by amalgamation.

The surfaces generally operated on by the gilder are so diverse, that the real value of his work can be determined satisfactorily only by taking his time and the materials employed

and consumed in executing a piece of work.

Plumber.—Lead, as the name imports, is the material in and with which the plumber operates. The previous preparation, casting and milling of lead into sheets, pipes, &c., and the composition and uses of solder, will be found described under the head Plumbery.

The principal operations of the plumber are directed to the covering of roofs and flats, laying gutters, covering hips, ridges, and valleys, fixing water trunks, making cisterns and reservoirs, and laying on the requisite pipes and cocks to them, fixing water-closet apparatus, setting up pumps, and applying indeed all the hydraulic machinery required in economic building. His tools are knives, chisels, and gouges for cutting and trimming, rasps or files and planes for fitting and jointing, a dressing and flatting tool for the purposes its name expresses, iron hammers and wooden mallets for driving and fixing, ladles in which to melt solder, grozing irons to assist in soldering, a hand-grate or stove which may be conveniently moved from place to place, for melting solder and heating the grozing irons, a stock and bits for boring holes, and a rule, compasses, lines and chalk for setting out and marking, together with weighing apparatus, as the quantities of most of the materials used by the plumber must be either proved or determined by weight. A plumber is always attended by a labourer, who does the more

laborious work of carrying the materials from place to place, Building. helps to move them when they are under operation, melts the solder and heats the grozing irons, attends to hold the one or the other, as neither may be set down or put out of hand when in use, and assists in some of the minor and coarser operations. In boarding roofs, flats, and gutters for lead, clasp-nails or flooring brads should be used; and the first care of the plumber should be to punch them all in from an eighth to a quarter of an inch below the surface, and stop the holes carefully and completely with putty, or a chemical process will ensue on the slightest access of moisture if the iron heads of the nails come in contact with the lead, and the latter will, in the course of no long period, be completely perforated over every one of them. Neither should lead in surfaces of any extent be soldered, or in any manner fastened at the edges, without being turned up so as to make sufficient allowance for the expansion and contraction which it is constantly undergoing during the various changes in the temperature of the atmosphere. It may be taken, indeed, as a general rule, that solder should be dispensed with as much as possible. Like glue to the joiner, it is indispensable in many cases; but like glue also, it is in common practice made to cover many defects, and much bad work, that ought not to exist.

Sheet lead, whether cast or milled, is supplied of various weight or thickness; and it is always described as of such a weight in pounds to the superficial foot. This varies from four to ten or twelve, so that the weight to the foot being ascertained, the whole weight of any quantity of the same thickness may be determined by admeasurement. There are very few purposes, indeed, in building, in which lead of less than six pounds to the foot should be used, and very few in which the weight need to exceed ten. For roofs, flats, and gutters, under ordinary circumstances, eight pounds lead is a very fair and sufficient average; for hips and ridges, lead of six pounds to the foot is thick enough; and for flashings five-pound lead need not be objected to. Cast lead has been preferred for the former purposes, because its surface is harder, but milled lead is of more even thickness throughout, it bends without cracking, which is not always the case with cast lead, and it makes neater work. Sheets of cast lead run from sixteen to eighteen feet long and six feet wide; milled sheets are made of about the same width, and six or eight feet longer than cast sheets. Neither the one nor the other may be safely used on flats, or in gutters exposed to the wide range of temperature of our climate, in pieces of more than half the length and half the breadth of a sheet; that is to say, from eight to twelve feet long, and three feet wide, are the limits within which sheet lead will expand and contract without puckering and cracking, and to allow it to move freely it is laid with rolls and drips in such a manner that any extent of surface may be covered with the effect of continuity, though the pieces of lead forming the covering be of such small sizes as above stated. But all fixing, whether by soldering, or otherwise, is to be carefully avoided. A roll is a piece of wood made about two inches thick and two and a half inches wide, rounded on one edge, and fixed with that edge uppermost, so as to come four inches within half the width of a sheet, that the edges may be turned up and folded round and over it, being lapped by, or lapping the similar edge of the adjoining sheet (fig. 37). Lead sufficiently stout, dressed neatly and closely down to the boards under it, and over the rolls at its edges, will require no fastening of any kind, unless it be so light as to be moveable by the wind. Rolls occur for the most part in roofs and flats, and drips principally in gutters. The drip is formed in the first instance by the carpenter in laying the gutter boards a ca cording to an arrangement with the plumber. It is a difference made in the height of the gutter of two or three inches, where one sheet terminates in length, and meets another in continuation. The end of the lower is turned up against the drip, and that of the upper is dressed down over it, so as effectually to prevent the water from driving up under it. Gutters should have a current of at least an eighth of an inch to the foot, and in flats it should be rather more; ends and sides which are against a wall should turn up against it from five to seven inches, according to circumstances; and the turning up under the slates, tiles, or other roof covering, to a gutter, should be to the level of that against the wall at the least. The turning up against the wall should be covered by a flashing. is a piece of lead let into one of the joints of the wall above the edge of the gutter lead, and dressed neatly down over, to prevent water from getting in behind it. (Fig. 36.) Lead on

its own weight, must be held down by nails.

In making cisterns and reservoirs, unless they be cast, the sheets of lead must of necessity be joined by soldering; but the water they are intended to contain protects the lead from the frequent and sudden changes to which in other and more exposed situations it is exposed.

Water trunks and pipes are made of a certain number of pounds weight to the yard in length, to every variety of bore or calibre that can be required. Water trunks or pipes are fitted with large case heads above, to receive the water from the gutter spouts, and with shoes to deliver the water below; they are fixed or attached to the walls of buildings with flanges of lead, which are secured by means of spike nails. Service and waste pipes to cisterns, &c., are generally supported and

attached by means of iron holdfasts.

Plumbers' work is for the most part estimated by the hundredweight of a hundred and twelve pounds, though there are of course many things which must be taken in detail, by the pound weight, by number, and even by size. It has been already shown in what manner the quantity of lead consumed may be determined, whether it be in sheets or in pipes; the weight per superficial foot of the one, and per lineal foot or yard of the other, being known, and it is always ascertainable, the dimensions of the various parts or portions of the work readily give the total amount in hundredweights or tons. The waste of lead in working is very trifling, as cuttings all go to the melting pot again with little or no loss but that of refounding or casting; and even old lead is taken by the lead merchant in exchange for new, at a very trifling allowance for tare and the cost of reworking. Water-closet apparatus, pumps, cocks, bosses, ferules, washers, valves, balls, grates, traps, funnels, &c., can all readily be counted and noted according to their sizes and peculiarities; and so may the various requisite joints in pipes, and attachments of cocks, &c., to the pipes, which must also be taken in addition to the articles themselves. The prices of all these goods, from the sheets of lead and the pipes, to the smallest articles used by the plumber, may be ascertained from the wholesale merchants and manufacturers; an addition of thirty per cent. to these prime costs will, under ordinary circumstances, afford the builder or tradesman an ample profit, and payment with sufficient profit on them also, for labour, solder, and nails, excepting cost of carriage, and any other contingent expense, which must be added to the gross. materials may, however, be taken with a recognised profit added to the prime costs and the actual labour expended; and solder and nails worked up may be reckoned from observation, or account kept of the workman's time, &c.

These things are mentioned more particularly, because a nefarious custom has obtained in this country, and is still allowed to a very great extent, by which the plumber is permitted to take not only an extortionate profit on his goods, but actually to charge twice for labour and the accessories. There is nothing more common than to find in a plumber's account a charge for lead (meaning sheet-lead) and labour, at so much per hundredweight,-charges for pipe of a certain bore or diameter at so much per foot,—for so many joints in pipe of such a size,—that is, for the labour and solder consumed and expended in making them,—and so on through all sorts of things, the account winding up at length, or being interspersed from time to time, with so many pounds or hundredweights of solder, and so many days' work of plumber and labourer! The now prevalent custom of artificers' work being done by general builders by tender and contract, has considerably lessened the injury to the public from this abuse, and proved it to be really so by the moderate profits the same men will content themselves with if they make a tender, who would persist in charging at the old rate if they were instructed to do the work without being bound by a contract. Such too is the effect of custom on the courts of justice in England, that the abuse referred to has been protected by them, and probably would be so still, because it was the custom and had been allowed!

Smith and Founder.—The goods supplied by the smith are charged by the pound according to the quantity of labour on them, and the founder has generally an average charge for iron castings at so much per hundredweight or per ton. The working up or fitting and fixing of smiths'-work devolves for the most part on the carpenter in whose favour it is taken, generally, however, in combination with some of his own pecu-

Building. ridges and hips not being in sufficient masses to be secured by liar works; but founders' work commonly requires to be fitted Building.

and fixed by the smith.

Glazier.—The business of the glazier may be confined to the mere fitting and setting of glass; even the cutting of the plates up into squares being generally an independent art, requiring a degree of tact and judgment not necessarily possessed by the building artificer. (See the articles Glass, Manufacture of, and GLASS-CUTTING.) The glazier is supplied with a diamond cutting tool, laths, or straight-edges of various lengths, a square, a glazing-knife, a hacking-knife, hammer, duster, sash-tool, and rule; and his materials are simply glass,

putty, and priming or paint.

The glass is supplied by the glass-cutter in squares or plates, of the sizes and qualities required for the particular work to be executed. The putty is made by the glazier himself or by a labourer, of fine clean powdered chalk or whitening, and linseed oil, well mixed and combined, and kneaded to the consistence of dough. No more putty should be made at once than is likely to be worked up in the course of a day, as, the oil drying out, it becomes hard and partially set, and is there-fore less available for its purposes. Priming is a thin solution of white, with a little red, lead in linseed oil. When the sashes come to the glazier from the joiner, they have been fitted into their places, and only require to be glazed before they may be permanently set or hung. Supposing that no preliminary process is required, such as stopping (the result of bad joiners' work) and knotting (and knotty stuff should not be admitted in sashes), the sashes require to be primed. The priming is laid on every part of the sash except the outer edges of the styles and of the bottom and top rails, with the sash tool or painting brush, that is, if the sashes are intended to be painted; for if not, the rebates only must be primed. The object of this is to prepare the material of which the sash is composed for the reception of the putty, which would not otherwise attach itself so firmly as it does after this preparation. The priming being sufficiently dry, the workman cuts the panes of glass down into their places, making every one fall readily into the rebates without binding in any part; indeed the glass should fit so nicely as not to touch the wood with its edges any where, and yet hardly allow a fine point to pass between it and the sash-bar or rebate, the object being to encase it completely in putty, and yet that the putty should not be in greater quantity than is absolutely necessary. The glass being fitted or cut down, the workman takes the glazing-knife in his right hand, and a lump of putty in the palm of his left, the sash being laid on its face, that is, with the rebates upward, before him; with the knife he lays a complete bedding of putty on the returning narrow stops of the rebates, all round to every pane. This being done, the panes of glass are put in on it as they have been fitted, and every one is carefully rubbed down with the fingers, forcing the putty out below and around the edges of the glass, until they are nearly brought into contact with the wood or other material of the The rebates are then filled in with putty behind, the mass forming exactly a right-angled triangle, its base being the extent of the stop of the rebate, and its perpendicular the depth from the glass to the outer edge of the rebate; the third side or hypothenuse is neatly smoothed off, and the sash being then turned on its edge and held uprightly by the left hand, the protruded putty of the bedding is struck off with the knife, and the section of it neatly drawn. The sashes are now deposited on their faces, to allow the putty to set, and then they may be hung and painted. To very large squares, and to plate-glass, small nails called sprigs are used to retain the glass securely while the putty is still soft and yielding.

Lead-work, as it is termed, is the glazing of frames rather than of sashes with small squares or quarries of glass, which are held together by reticulations of lead; and these are secured to stout metal bars, which are fixed to the window frames. The leaden reticulating bars are grooved on their edges to receive the quarries, and are tied by means of leaden ribands or wires to the saddle bars, which, in their turn, are affixed to the stouter bars before mentioned, if the bay or

frame be so large as to require both.

Glazing is valued by the superficial foot, the squares or panes being measured between the rebates in which they are set. The value of plate-glass is very much effected by the sizes of the panes, every additional inch in extent of surface adding materially to the cost of production of the whole piece

Bukhara.

Building or plate; it must therefore be carefully noted according to its Common window glass is divided into best, magnitude. Builth. seconds, and thirds, and is charged higher as the panes increase in size, because for large panes the table cuts to waste more than in cutting small ones. In ordinary practice, panes containing two superficial feet and under are classed together; then from two feet to two feet six inches, and so on; and according to the quality of the article. Flatting, bending, grinding, staining, &c., are all subjects of separate and independent charge.

Lead lights are taken by the superficies generally of a hundred feet, lead and glass being included in the same charge, which, however, depends on the size of the quarries. Stay and saddle bars are taken separately, according to their num-

ber and magnitude.

Painter.—The processes of economical painting will be found described in an article under the head PAINTING. The real object of painting is to protect wood, metals, and stuccoes from being readily acted upon by the atmosphere, by covering their surfaces with a material which is capable of resisting it. A continued succession of moisture and dryness, and of heat and frost, soon effects the decomposition of woods, causes oxidation in most of the metals used for economical purposes, and destroys the generality of stuccoes if their surfaces be exposed nakedly to it. A solution of ceruse or white lead in linseed oil spread over them prevents these injuries in a great measure, and for a considerable period of time; and as the application of such an unction can be repeated without much trouble or expense as often as occasion may require, it may be said to furnish a protection against the cited contingencies. In addition to the utility of painting, it is also available as an ornament, by bringing disagreeably or diversely coloured surfaces to a pleasing and uniform tint, or by diversifying a disagreeable monotony of tint, to suit the taste and fancy; and this is done in a great measure by the addition of various pigments to the solution before mentioned.

The painter works with hog's-bristle brushes of various sizes, which, with the exception of pots to hold his colours, a grinding-stone and grinder or muller for grinding or triturating them, a pallet and a pallet knife, are almost his only implements. His materials are comparatively few also; but for some purposes these require a great variety of ingredients, the preparation and combination of which, however, devolves principally on the manufacturer or colourman, and not on the painter himself.

The first thing the workman has to attend to in painting wood-work, is to prepare its surface for the reception of paint, by counteracting the effect of anything that may tend to prevent it from becoming identified with the material. Thus, in painting pine-woods of any kind, the resin contained in the knots which appear on the surface must be neutralized, or a blemish will appear in the finished work over every resinous part. Inequalities or unevennesses of surface, too, must be reduced with sand-paper or pumice-stone, or made up with The necessary process for killing knots, just referred to, will generally leave a film, which must be rubbed down; and the heads of nails and brads having been punched in, will present indentations, which should be stopped. In painting or laying on the colour, the brush must be constantly at right angles to the face of the work, only the ends of the hairs, in fact, touching it. for in this manner the paint is at the same time forced into the pores of the wood and distributed equally over the surface; for if the brush be held obliquely to the work, it will leave the paint in thick masses wherever it is first applied after being dipped for a fresh supply into the pot, and the surface will be daubed but not painted. Painting, when Building properly executed, will not present a shining, smooth, and glossy appearance, as if it formed a film or skin, but will show a fine and regular grain, as if the surface were natural, or had received a mere stain without destroying the original texture. Imitative grainings, however, and the varnishes which are intended to protect them, and make them bear out, necessarily produce a new and artificial texture; and for this reason they are all to a greater or less extent disagreeable, how well soever the imitations may be effected.

As it must be presumed that all the wood submitted to the operations of the painter, which has passed through the hands of the joiner, was already well seasoned and properly dry, it is only necessary to say generally, that work should be free from moisture of any and every kind before paint is applied to it, or it will at the least prove useless, and probably injurious rather than beneficial. This remark applies alike to wood and to plastered work, both internal and external; that is, whether they be subjected to the more violent changes of the weather or not. Dampness or moisture in woods, and stopped in or covered up with paint, will, under ordinary circumstances, tend to their destruction; and in stuccoes it will spoil the paint, and most probably injure the plastering itself

Painters' work, on extended surfaces, is valued by the yard superficial, according to the number of coats, or the number of times the paint has been applied to the surface, and to the manner in which, and matter with which, it is finished. On skirtings, surbases, narrow cornices, reveals, single mouldings, sills, string courses, &c., it is measured by the foot run; sash-frames and the squares or panes of sashes, are numbered, the latter by the dozen; and so are other things which do not readily admit of being measured. Rich cornices, expensive imitations, &c., are taken by the foot superficial; and preparations before the work can be commenced are most fairly charged for by the time they occupy and the materials they consume. The work is taken, as one, two, three, four, or more times in oil, common colour; or so many times finished of a certain colour that is more expensive than what is called common; or as so many times, and flatted of such a colour, the flatting being an extra coat; or as painted so many times, and grained and varnished. Common colours are those which are produced by the addition of lamp-black, red-lead, or any of the common ochres to white-lead and oil; blues, greens, rich reds, pinks, and yellows, &c., being more costly, are taken as such. Unflatted white is a common colour; flatted, it classes with the rich colours. If the same surface be painted of two different tints, it is said to be in party colours, and an allowance is made in the price for the additional trouble of finishing in that manner. Carved mouldings and other enrichments having to be picked in with a pencil or small brush, that the quirks, &c., be not choked up, must be taken extra, by the run or by number; and if the picking in be in party colours, the labour is necessarily greater than if the work be plain.

What is termed decorating, is divided between the painter and the paper-hanger. Decorations must necessarily depend upon the taste and skill required or employed in producing them; and the remuneration must also of course be contingent. Decorative papers are paid for by the piece or yard, a piece being made in this country twelve yards long and twenty inches wide, and the hanging is charged at so much the piece. Borders are charged by the yard for the material, and by the dozen for hanging. Sizing and otherwise preparing the walls are considered beyond the charges for hanging. (W. H-G.)

BUILTH, or BUALT, a market-town of South Wales, county of Brecknock, 12 miles S.W. of New Radnor, pleasantly situated on the Wye, here crossed by an excellent bridge of six arches. It consists of two narrow, ill-formed streets, running nearly parallel to each other, and forming irregular terraces on the side of an acclivity rising from the river. On account, however, of its fine situation, and the salubrity of its air, it is much frequented. At the east end of the town are some remains of a castle, said to have been erected in the eleventh century by Bernard Newmarch,

lord of Builth. About a mile and a half N.W. of the town are three mineral springs—a saline, a sulphurous, and a chalybeate. Market-day Monday. Pop. (1851) 1158.

BUKHARA, BOKHARA, or BUKHARIA, a country and khanat of Asia, in Tookistan or Independent Tartary, lying between Lat. 34° and 41° N. and Long. 63° and 70° E. It is bounded on the north by Khokan, west by the khanat of Khiva, east by Koondooz, and on the south its boundary first follows the course of the Oxus, and afterwards proceeds along the sands on the left bank of that river. Its area is estimated at

Bukhara. 235,000 square miles; but, like the other states of Central Asia, the limits and extent of Bukhara cannot well be determined,-since they expand or contract according to the strength or weakness of its rulers. The cultivated parts of the country, however, are small in proportion to its extent: they lie chiefly along the banks of the rivers, and are separated by sandy plains unfit for culture, and only offering an asylum to the wandering tribes, who, to escape starvation, are continually obliged to shift their encampments. Bukhara may be generally described as a level country, with few elevations except on its eastern and southern frontiers. The mountains in the eastern part of the country are spurs of the Hindu-Koh, and are supposed by Burnes to attain the height of at least 18,000 feet. Those on the southern frontier seem to belong to the Paropamisan range. The principal rivers of Bukhara are the Amu or Oxus, the Zeraffshan, and the Kurshee. The Amu takes its rise, according to Lieut. Wood (an account of whose expedition to its source will be found in the Royal Geographical Society's Journal for 1840), from a crescent-shaped lake in Lat. 37. 30. N. and Long. 73. 50. E. This lake is 14 miles in length, with an average breadth of one mile, and is 15,600 feet above the level of the sea. The Amu flows from S.E. to N.W., and varies in width from 300 to upwards of 800 yards. The second river of the khanat is the Zer-affshan, which, though inferior to the Amu in the volume of its waters, is superior to it in the populousness and cultivation of its banks. It rises in the high lands east of Samarcand, and, passing north of that city and of Bukhara, forms a lake in the province of Karakool. This lake is about 25 miles in length, and surrounded on all sides by sand-hills. The Kurshee rises in the same high lands as the Zer-affshan, and passes through Shuhr-Subz and Kurshee, below which it is lost in the desert.

North of the Oxus, and from the base of the mountains of Bukhara, there is a succession of low, rounded ridges of limestone, oolite, and gravel, thinly overgrown with verdure, alternating with vast and hardened plains of argillaceous clay. There are no gold mines in Bukhara, but that metal is found among the sands of the Oxus in greater abundance, perhaps, than in any of the other rivers which flow from the Hindu-Koh. Sal-ammoniac is found among the hills near Juzzak, and salt is very plentiful. In the mountains to the east, near Sarvadi, are copious mines of fine coal and copper ore. The climate of Bukhara, at least in the cultivated parts, is salubrious and pleasant. In summer the thermometer seldom rises above 90°, and the nights are always cool. The frosts commence about the end of November, and continue till towards the end of April. The Amu is generally frozen over for some weeks in winter so as to be passable for caravans. In the desert the heat in summer exceeds 100° Fahr. Thunder-storms and earthquakes are not unfrequent, especially in the spring; and there are sometimes violent tornadoes, generally blowing from the N.W.

The population of Bukhara is composed of Tadjiks, Arabs, Uzbeks, Turkomans, Persians, Jews, &c. The population may be estimated at 2,000,000. Meyendorff estimates it at 2,478,000; Khanikoff at from 2,000,000 to 2,500,000; Burnes at less than 1,000,000; and Wolff at 1,200,000. The Tadjiks are the aborigines of the country, and are said to have come from the west, and settled on the banks of the Zer-affshan at a time when the country was uninhabited, and a jungle of reeds covered the place where the town of Bukhara now stands. Except in the town of Bukhara, where they constitute the majority of the population, there are few Tadjiks now in the khanat. They are mostly engaged in commerce, are peaceful or even cowardly in their disposition, and characterized by avarice, faithlessness, and deceit. They are usually tall, with handsome and regular features, fair complexion, and black eyes and hair. The number of Arabs, though inconsiderable, exceeds that of the

Tadjiks. They were the first intruders upon the aborigines, Bukhara. having conquered the country about the beginning of the eighth century, and compelled the inhabitants to adopt the Mohammedan faith. They inhabit the northern part of the khanat, and like their ancestors still continue to lead a wandering life, their chief occupation being the tending of their flocks. Their moral qualities seem to be of a higher character than those of the Tadjiks. The Uzbeks, the last people that conquered this country, are the most numerous, and are at present the dominant race in the khanat. They are divided into a number of tribes, of which the principal is that of Manghit. To it the reigning dynasty belongs. Some of the Uzbeks are nomadic in their habits, others are engaged in agriculture, or live in towns. They are more bold and straightforward in their manners than the Tadjiks, but, like them, avaricious and deceitful. There are a considerable number of Persians in Bukhara, most of whom have been brought captive from their native country. They are readily distinguished by the regularity of their features, and their bushy black hair. Although outwardly conforming to the faith and manners of the country, they cordially hate the Bukharians, and are ready to hail with joy any political revolution which might shake the power of the Uzbeks. The Jews, though long established in the country, form but a very inconsiderable part of its inhabitants. They are chiefly to be found in Bukhara, Samarcand, and some of the larger towns, where they have separate quarters assigned to them. Their privileges are very restricted. The Turkoman part of the population is wholly nomadic, and is chiefly to be found in the region south of the Oxus. The orchards in the neighbourhood of the larger towns are numerous, and highly cultivated. They produce grapes, figs, peaches, pomegranates, apricots, prunes, apples, pears, quinces, cherries, and almonds. The cultivation of cotton, tobacco, and lucerne, is extensively carried on, as is also that of the mulberry, beet, cabbage, carrots, radishes, onions, cucumbers, pease, beans, lentils, melons, and pumpkins. being of a saline nature, requires to be cultivated with some care, so that it is found to be much more profitably laid out in gardens than in fields; indeed, the returns from the former exceed by seven-fold the returns from the same quantity of the latter. Wheat, rice, barley, millet, and jowaree (Holcus saccharatus), are the principal kinds of grain grown here. This last is one of the most useful productions of the khanat, and as it is cheap and nutritious, it forms the chief subsistence of the poor.

The horses of Bukhara are numerous, but are more remarkable for strength and bottom than for symmetry or beauty. Asses are also very plentiful, and are large and sturdy. They are not only used for riding by the less wealthy, but also as beasts of burden. The camels, by means of which the entire traffic of Bukhara is carried on, are reared chiefly by the wandering tribes, particularly the Turkomans. They have a sleek coat as fine as that of a horse, and shed their hair in summer, from which a fine waterproof cloth of close and rather heavy texture is manufactured. The goats are about the common size, of a dark colour, and yield a shawl wool inferior only to that of Cashmere. The bulls and cows are miserably small, and in a very wretched condition. The rearing of sheep is much attended to, particularly by the Arabs. There is a peculiar breed, producing a jet-black Arabs. There is a peculiar breed, producing a jet-black curly fleece in much repute, and which is said to thrive only in the district of Karapul. The wild animals are few. Tigers of a diminutive species are found in the valley of the Oxus; wild hogs, herds of deer, antelope, and the wild ass, roam on the plains; and foxes, wolves, jackals, ounces, and occasionally tigers, are found in some parts. The scorpion is common, but its sting is seldom very virulent. All kinds of game are scarce. The most valuable insect is the silkworm, which is reared in all parts of the khanat where

Bukhara, there is water; every stream or rivulet being lined with spects beyond the performance of its prayers; but they have Bukhara, the mulberry. Each student purgreat pretensions and greater show." Each student purgreater show."

Bukhara owes its importance to its central position. Lying on the route between Europe and the richest part of Asia, it is the seat of a considerable trade. The government has established custom-houses, built caravanserais, and constructed cisterns along such caravan roads as are insufficiently supplied with water, but otherwise does nothing to encourage traffic; and the roads are, generally speaking, in a wretched condition. There are no privileges in favour of the merchants of one nation to the prejudice of those of another, except that Mussulmans payonly  $2\frac{1}{2}$  per cent., while all others pay 5 per cent. on the goods they import. Bukhara carries on an extensive trade with Russia by means of caravans, which travel by the following routes, viz., by the route of Khiva to the shores of and across the Caspian from and to Astrakan; by the route to and from Orenburg by land in 60 days, through Orghenje in Khiva; to and from Troidska in Tobolsk, by the route east of the sea of Aral in 49 days; and to and from Petropavslok in 90 days. From 5000 to 6000 camels are annually employed in this trade. Bukhara exports to Russia, besides cotton, which is the principal item, dried fruits, rice, raw and dyed silks, indigo, silk sashes, turquoises, shawls, and furs. It imports muslins, calicoes, chintzes, some silk stuffs, broad-cloth, brocades, hides, iron and other metals. The trade with Khiva employs only from 1000 to 1500 camels, and consists chiefly in exporting to Bukhara Russian goods, of which there is always an available surplus in the markets of Khiva. Three, and occasionally four caravans arrive annually from Meshid, in Persia, bringing cotton and silk stuffs, calicoes, chintzes, muslins, carpets, shawls, and turquoises; and receiving in return lamb-skins, cotton, rice, &c. From Herat and Cashmere it imports a considerable quantity of shawls; and Indian produce and English manufactures from Cabul. A brisk traffic is also carried on with Khohand, Tashkand, Kashgar, and Yarkand. The greater part of the goods brought into Bukhara are not consumed there, but are immediately exported to other countries. The central points of commerce are Bukhara, Samarcand, and Kurshee; and trade is principally conducted at the marts and fairs that are held in various parts of the country. Almost the only manufactures carried on in Bukhara are those of cotton goods, silks, leather, hardware, and jewellery. There is but one manufactory of castiron articles.

Bukhara has for ages been reckoned the centre of Mussulman erudition; and if we look at the number of its schools and the state of education among its people, we cannot but admit, that in that respect it ranks first among the states of Central Asia. About one-fourth of the population is said to be able to read and write. The primary schools are numerous in the capital, as well as in the other cities, and even villages. In Bukhara there is one in almost every street. They are founded either by private donations, or by the joint contributions of the inhabitants of the street by order of the emir. The course in these schools extends over about seven years. Those wishing to continue their studies then enter the medressehs or seminaries, in which they pursue a higher course of studies under one or two professors who have acquired the right to give lectures. Each establishment has a fixed number of students, according to the extent of the building. Fifteen, or even twenty years, are reckoned insufficient to go through a complete course in these institutions. They are principally exercised in subtle disputations upon theological subjects, which only tend to strengthen fanaticism and religious bigotry. Burnes says, "The students are entirely occupied with theology, which has superseded all other points; they are quite ignorant even of the historical annals of their country. A more perfect set of drones were never assembled together; and they are a body of men regardless of their religion in most re-

spects beyond the performance of its prayers; but they have great pretensions and greater show." Each student purchases the right to inhabit the *medresseh* from him whose place he takes, and receives a fixed annual allowance during his attendance. The number of *medressehs* is estimated by Khanikoff at not more than from 180 to 200, the elementary schools at ten times that number, and the number attending these institutions at between 150,000 and 160,000, or about one-sixteenth of the entire population.

The people are very superstitious, believing in witchcraft,

omens, spirits, the evil eye, &c.

The government is a hereditary despotism, the khan having the power of life and death over his subjects. The civil administration is in the hands of the clergy, and is founded on the Koran and the commentaries upon it. "When we place the vices of Bukhara in juxtaposition with its laws and justice, we have still much to condemn; but the people are happy, the country is flourishing, trade prospers, and property is protected." "There is no place in the whole of Asia where such universal protection is extended to all classes." So says Burnes; but it is impossible to peruse the accounts of other travellers without arriving at an opposite conclusion. Burnes himself narrates that the present khan paved his way to power by the murder of four of his own brothers. He afterwards murdered his vizier Kooshbeghi, with most of his relatives, though it was chiefly through their means that he had secured the throne. He also put to death the two English travellers Stoddart and Conolly, and evidently intended that Dr Wolff should share the like fate. These and numerous other cruelties show him to be a tyrant and a despot of the worst kind; and Meyendorff says that the principles of government are hypocrisy and extortion. The troops of the khan are estimated at about 40,000 men, but of these not more than one-third are completely armed. The languages in use are the Persian and Turkoman; the latter is spoken by the Uzbeks, and the wandering tribes south of the Oxus.

Bukhara was known to the ancients under the name of Sogdiana; and was too far removed to the east ever to be brought under the wide-spreading dominion of Rome. But it has shared deeply in all the various and bloody revolutions of Asia. It is mentioned by the earliest historical writers of Persia; and, about the year 856, Yacoob-bin-Leis is said to have been invested with the government of that province by the caliph. About twenty years later, it was conquered by Ismael, the first sovereign of the Sassanean dynasty, whose successors held it until the renowned Malek Shah, third of the Seljuk dynasty of Persia, passed the Oxus about the end of the eleventh century, and subdued the whole country watered by that river and the Jaxartes. In the year of the Hejira 594, A.D. 1216, Bukhara was again subdued by the celebrated Mahomed Shah Khauresme, who enjoyed his conquest but a short time ere it was wrested from him by the irresistible power of Ghenghis Khan in A.D. 1220. The country was wasted by the fury of this savage conqueror; but recovered some share of its former prosperity under Octai Khan, his son, whose disposition was humane and benevolent. His posterity retained the dominion of this country until about the year 1400, when Tamerlane with his mighty host bore down everything before him, and spread far and wide the terror of his arms. His descendants ruled in the country until about the year 1500, when it was overrun by the Usbeck Tartars, in whose possession it still remains.

BUKHARA, or Bokhara, the capital of the khanat of the same name, is situated at the distance of 6 or 7 miles from the left bank of the Zer-affshan in Lat. 39. 48. N. Long. 64. 26. E. It is 8 miles in circumference, of a triangular shape, and surrounded by a wall of earth about 20 feet high, which is pierced by 11 gates. It lies embosomed among gardens and trees, and few great buildings are to be seen from the

Bulk

Bull.

Bukkur || Bulgaria.

exterior; but when the traveller passes its gates he winds his way among lofty and arched bazaars, and sees each trade in its separate quarter of the city. Everywhere he meets with ponderous and massy buildings, colleges, mosques, and lofty minarets. About twenty caravanserais give accommodation to the merchants of different nations, and about 100 ponds and fountains, constructed of squared stone, furnish its numerous population with water. The city is intersected with canals shaded by mulberry trees, which serve to bring water from the river, but in summer are sometimes dry for months. The streets are so narrow that a laden camel fills up even the largest, and in the smaller ones two persons have difficulty in passing each other; they are extremely dirty and always crowded with camels, horses, and asses. With the exception of its public buildings, most of its houses are small and of only one story; yet there are many buildings of a superior class in the city. The common houses are built of sun-dried bricks on a framework of wood, and are all flat-roofed. The greatest of the public buildings is a mosque, which occupies a square of 300 feet, and is surmounted by a dome rising to one-third of that height. Attached to this mosque is a lofty minaret built of bricks, distributed in most ingenious patterns. The handsomest building of Buckhara is a college of the king Abdalla. There are 360 streets and lanes in the city, most of them unpaved, and all in a very wretched condition. There are likewise 360 mosques. The number of medressehs or colleges in Bukhara is estimated by Khanikoff at 103, but by Burnes at 366. The baths are numerous. The population is estimated by Meyendorff at about 70,000, and this estimate corresponds with those of Moorcroft and Khanikoff. Burnes, however, estimates it at 150,000, and Wolff at 180,000. About 4000 of the population are Jews.

BUKKUR, an island and fort of Scinde in the Indus, between the towns of Roree on the eastern, and Sukkur on the western bank. The island is a rock of limestone of an oval shape, 800 yards long, 300 wide, 1875 in circuit, and about 25 feet high. It is almost entirely covered by the fortress, the walls of which are double, and from 30 to 35 feet high. In the beginning of 1839 the British army crossed here on a bridge of boats. Lat. 27. 41. N. Long. 68. 52. E.

BUL (Sept. Baál), the name applied, in 1 Kings vi. 38, to the Hebrew month *Marcheshoûn*, which was the eighth of the ecclesiastical, and the second of the civil year of the Jews, and began with the new moon of our November.

BULAK. See CAIRO.

BULAM, or Bulama. See Bissagos.

BULARCHUS, a Lydian painter, the first who introduced, among the Greeks at least, different colours in the same picture. He flourished about B.C. 740. See PLINY.

BULB, that protuberant part of a plant which usually lies below the ground, emitting roots from its base, and producing a stem or leaf from its apex. It consists of imbricated scales, or of concentric layers, as in the onion, hyacinth, lily, &c. A tuber, properly speaking, differs from a bulb in being solid, as the potato.

BULGARIA, a province of European Turkey, extending from the mouth of the Danube, along that river till it meets the Timok above Widdin, on the borders of Servia. The Danube forms the whole of its northern, and the parallel chain of the Balkan its southern boundary. It is about 350 miles long, by from 60 to 100 broad. It has an area of about 33,000 square miles, and an estimated population of about 3,000,000.

This province was the *Mæsia Inferior* of the Romans, and derives its present name from the Bulgarii or Bulgares, one of the northern hordes who abandoned their dreary plains to seek a more propitious climate in the south. They left the Volga in the sixth century, and crossing the Danube near its mouth, established themselves in the inviting

country which lies between that river and the mountains, extending westward from the shore of the Euxine. Here they defied all the efforts of the Greeks of the lower empire to dispossess them; and their various and sanguinary conflicts form a considerable portion of the history of that period. They carried on many contests with the emperors of the East; but in the eleventh century they were at length confined within certain limits, and the country was reduced to the state of a province. On the decline of the Greek empire, however, it was finally brought under the Turkish yoke by Bajazet, when the Turks had established themselves in the neighbouring province of Rumelia, the ancient Thrace.

The country, except in the neighbourhood of the Danube and the Euxine, is mountainous; but the sides of the smaller hills afford excellent pasture, and the soil is exceedingly rich and fertile. It is irrigated by a number of rivers and streams, tributaries of the Danube. The climate is mild, and the productions are various and abundant, consisting of corn, hemp, flax, tobacco, &c. The vine is very extensively cultivated. The people have entirely laid aside the warlike character which distinguished their ancestors. The avocations of the greater number of them are pastoral, and their character corresponds with this mode of life.

The Bulgarians fabricate to a great extent several articles which are famous in Turkey; one is a coarse woollen cloth, and another rifle gun-barrels. But the employment most congenial to their rural habits is the preparation of the otto or attar of roses, much of which comes to England. Rose trees are very plentiful, and gardens are laid out for the purpose of cultivating them. Cattle, tallow, timber, hides, wine, and the other productions of the country, constitute their principal exports. The language of the people is a dialect of the Sclavonian, and bears a resemblance to the Russian. Only a few elementary books have been printed in this language, and it has never been reduced to grammatical rules. The books introduced are in Greek, but that language has made no progress amongst the people, who are consequently very illiterate. Their religion is Christianity, which they embraced on their arrival in the district. They belong to the Greek Church, subject to the Greek patriarch of Constantinople, who appoints their bishops. There is generally attached to every two or three villages a priest, who performs the duties of his vocation in each alternately; but, unless in a very few places, they are destitute of churches, schools, and books. The principal towns, such as Sophia, Shumla, Ternevo, &c., will be described as they occur alphabetically.

The Bulgarians have extended themselves beyond the limits which they originally occupied. They have crossed the chain of mountains, and now occupy almost exclusively a considerable portion of Rumelia.

BULK OF A Ship, the whole space in the hold for the stowage of goods.

BULK-Heads are partitions made athwart the ship with boards, by which one part is divided from the other; as the great cabin, gun-room, bread-room, &c.

BULL. See MAMMALIA, and AGRICULTURE.

Bull (Italian bolla, Latin bulla), among ecclesiastics, a letter written on parchment, sealed with lead, and issued by order of the pope, from the Roman rota or chancery. It is a kind of apostolical rescript or edict, and is chiefly in use in matters of justice or grace. If the former be the intention of the bull, the lead is hung by a hempen cord; if the latter, by a silken thread. It is this pendent lead or seal which is, properly speaking, the bull, and which is impressed on the one side with the heads of St Peter and St Paul, and on the other with the name of the pope and the year of his pontificate. The bull is written in an old round Gothic character, and is divided into five parts, the narrative of the fact, the conception, the clause, the date, and the salutation,

Bull

Bulleyn.

Bull.

in which the pope styles himself episcopus, servus servorum, or the servant of servants. This instrument has about it a cross, with some text of Scripture, or religious motto. Bulls are granted for the consecration of bishops, the promotion to benefices, the celebration of jubilees, &c., &c.

Bull in Cona Domini, a particular bull read in the pope's presence every year, on the day of the Lord's Supper, or Maundy Thursday, and containing excommunications and anathemas against heretics, and all who disturb or oppose the jurisdiction of the holy see. After the reading of the bull, the pope throws a burning torch in the public place, to denote the thunder of this anathema.

Golden Bull, a statute or enactment published A.D. 1356, by the Emperor Charles IV., and hence called Caroline, reputed to be the magna charta or the fundamental law of the German empire. It is called golden because it has a golden seal, in the form of a pope's bull, tied with yellow and red cords of silk; while on one side the emperor is represented sitting on his throne, and on the other the capitol of Rome. Till the publication of the golden bull, the form and ceremony of the election of an emperor were unsettled, and the number of the electors was not fixed. This solemn edict regulated the functions, rights, privileges, and precedence of the electors. The original, which is in Latin, on vellum, is preserved at Frankfort. This ordonnance, containing thirty articles or chapters, was approved by all the princes of the empire.

Silver Bulls were not usual, though instances of them

Leaden Bulls were sent by the emperors of Constantinople to patriarchs and princes; and they were also used by the grandees of the imperial court, as well as by the kings of France, Sicily, and other countries; and by bishops, patriarchs, and popes. It is to be observed that the leaden bulls of these last had, on one side, the name of the pope or bishop inscribed. According to Polydore Virgil, Pope Stephen III. was the first who used leaden bulls, about the year 772; but instances of them are to be met with as early as the times of Silvester, Leo I., and Gregory the Great. The latter popes, besides their own names, strike the figures of St Peter and St Paul on their bulls, a practice first introduced by Pope Paschal II. But why, in these bulls, the figure of St Paul is on the right, and that of St Peter on the left side, is a question which has occasioned many conjectures and disputes.

Waxen Bulls are said to have been first brought into England by the Normans. They were of two sorts, red and green, and were frequently used by the Greek emperors, who thus sealed letters to their relations.

Bull, George, bishop of St David's, was born at Wells in 1634, and educated at Exeter College, Oxford. The first benefice he enjoyed was that of St George's near Bristol, from which he rose successively to be rector of Suddington in Gloucestershire, prebendary of Gloucester, archdeacon of Llandaff, and in 1705 bishop of St David's. He died Feb. 17, 1710. During the time of the Commonwealth he adhered steadily, though with great prudence, to the forms of the Church of England; and in the reign of James II. preached very strenuously against the errors of Popery. His principal works are, A Defence of the Nicene Faith; Apostolical Harmony; Primitive Apostolical Tradition; besides which he wrote many others. His collected works were published in 1703 by the learned Dr Grabe, in 1 vol. folio.

Bull, John, a distinguished English composer and organist, was born in Somersetshire about 1563. In 1591 he was appointed organist in the Queen's chapel; in 1592 received his degree of Doctor of Music at Cambridge University; and in 1596 was made music-professor to Gresham College, London. As he was unable to lecture in Latin, according to the foundation-rules of that college, the executor.

tors of Sir Thomas Gresham made a dispensation in his favour by permitting him to lecture in English. He gave his first lecture on 6th October 1597. He afterwards visited France and Germany, and was everywhere received with the respect due to his talents. The absurd story told by Anthony Wood of Dr Bull's feat in composition at St Omer, is simply impossible. Honourable employments were offered to him by various continental princes; but he declined them, and returned to England, where he was appointed organist to James I. in 1607, and in the same year resigned his Gresham professorship. In 1613, he again went to the continent on account of his health; and, in the Netherlands, entered into the service of the archduke. According to some writers, he died in 1623 at Hamburg; according to others, at Lubeck. Little of his music has been published, and the opinions of critics differ much as to its (G. F. G.)

U

Bull-fight, a favourite amusement among the Spaniards and Portuguese, consisting in a kind of combat between an armed man or torreador and a wild bull, either on foot or on horseback. This sport the Spaniards received from the Moors, among whom it was celebrated with great pomp. Some think that the Moors might have received the custom from the Romans, and the latter from the Greeks. Dr Plot is of opinion that the Taupokaθαψίων ἡμέραι among the Thessalians, who first instituted this game, and of whom Julius Cæsar learned and brought it to Rome, were the origin both of the Spanish and Portuguese bull-fighting, and of the English bull-running. See Spain.

BULL-HEAD. See ICHTHYOLOGY, Index.

BULLA, a kind of ornament worn about the neck, much in use among the ancient Romans. Whittaker, in his History of Manchester (vol. i. p. 79), is of opinion that bullæ were originally formed of leather among all ranks of people; and it is certain that they continued so to the last among the commonalty. He also imagines that at first the bulla was intended as an amulet rather than an ornament. Pliny refers the origin of the bulla to the elder Tarquin, who gave one along with the prætexta to his son, because at the age of fourteen he had killed an enemy; and in imitation of him it was afterwards assumed by other patricians. Some, however, affirm that the bulla was given by that king to the sons of all the patricians who had borne civil offices; whilst others allege that Romulus first introduced the bulla, and gave it to Tullus Hostilius, the first child born after the rape of the Sabines. The form of the bulla was generally circular. As the wealth of the state and the riches of individuals increased, the young patrician distinguished himself by a bulla of gold, whilst the common people wore the amulet of their ancestors. The bulla was laid aside at the same time as the prætexta, and consecrated to the Lares. Bullæ were not only hung round the necks of young men, but also on the foreheads of horses, and were sometimes allowed even to statues; whence the phrase statuæ

Bulla was also the denomination given to divers other metallic ornaments made after the same form. Such were the decorations used by the ancients on their doors and girdles. The bullæ of doors were large-headed nails or studs, carefully brightened or polished. The doors of temples were sometimes adorned with golden bullæ. By such door-studs were indicated which days were fasti and which nefasti.

BULLEYN, William, a learned physician and botanist, born in the Isle of Ely about A.D. 1500, and educated at Cambridge. He travelled through various parts of England, Scotland, and Germany, chiefly with a view to improve his knowledge of plants; and on his return, in 1550, he was made rector of Blaxhall in Suffolk; but he afterwards removed to Durham, where he practised physic with considerable success. Here he contracted a great in-

5 p

Bumpkin.

Bullfinch timacy with Sir Thomas Hilton, governor of Tinmouth Fort. In 1560 he went to London, and soon after his arrival was accused by the brother of Sir Thomas of having murdered his friend and patron, who had died of a malignant fever while under Bulleyn's care. He was arraigned before the Duke of Norfolk, but honourably acquitted. This Hilton afterwards hired some villains to assassinate him; but failing in the attempt, he arrested him on an action for debt, and sent him to prison. During his confinement Dr Bulleyn composed several of those works which established his reputation as a medical writer. He died in 1576. Dr Bulleyn was well acquainted with the works of the ancient Greek, Roman, and Arabian physicians. He wrote, The Government of Health, 1558-59, 8vo, republished in 1595; A regimen against the Pleurisy, 8vo, Lond. 1562; Bulwark of Defence against all Sickness, Soreness, and Wounds, London, 1562, 1579, folio; A Dialogue both pleasant and pitiefull, wherein is a goodlie regimen against the fever pestilence, Lond. 1564, 8vo, 1569,

BULLFINCH. See Ornithology. BULL-FROG. See REPTILIA.

BULLIALDUS (the Latinized form of BOULLIAU, or BOUILLAUD), ISMAEL, an eminent astronomer, born at Loudun in France in 1605. He travelled in his youth for the sake of improvement; and afterwards published several works, among which are the following, viz.:-

1. De Natura Lucis, 1638, 8vo; 2. Philolaus, 1639, 4to; 3. Astronomia Philolaica, opus novum, in quo motus planetarum per novam et veram hypothesin demonstrantur, Loudun, 1645, folio; 4. Astronomiæ Philolaicæ Fundamenta clarius explicata et asserta adversus Zethi Wardi impugnationem, 1657, 4to; 5. De Lineis Spiralibus Demonstrationes, 1657, 4to; 6. Ad Astronomos Monita duo, 1667; 7. Ptolemmi Tractatus de Judicandi Facultate, 1667, 4to; 8. Opus Novum ad Arithmeticam Infinitorum, 1682, folio. Afterwards he became a presbyter at Paris, and died there in 1694.

BULLINGER, HEINRICH, born at Bremgarten in Switzerland in 1504, was an eminent Zuinglian minister, a great supporter of the Reformation, and employed in many ecclesiastical negotiations. His printed works are very numerous, and many of them were translated into English. They form ten vols. folio. Bullinger died at Zurich in

BULLION, uncoined gold or silver in the mass. The precious metals are so called either when smelted and not perfectly refined, or when refined and melted down in bars or ingots, or in any form uncoined, as in plate.

BULTI or BULTISTAN (called also LITTLE THIBET), a small state of Central Asia, north of Kashmir, lying between Lat. 34. 40. and 35. 30. N. and Long. 74. 40. and 76. 20. E., having an area of about 12,000 square miles, and an estimated population of 75,000. It is bounded on the north by Chinese Tartary, east by Ladakh or Middle Thibet, south by Deotsuh and other elevated desert tracts, and on the west by Astor and other small independent states. It consists chiefly of a valley having an average elevation of 6000 or 7000 feet above the sea, and through which flows the Indus in a north-westerly direction. It is surrounded by bare, rugged, and nearly inaccessible mountains, rising to the height of 6000 or 8000 feet. In winter the cold in the higher parts is intense. The soil is not fertile, but is carefully cultivated, and produces wheat, barley, millet, buckwheat, turnips, fruits, and some rice. The capital is

Iskardoh. (See Thornton's Gazetteer.)
BUMM, a town of Persia, in the province of Kirman, and 115 miles E.S.E. from the town of that name. It was formerly of great importance and magnificence, and is still a place of considerable strength, having a citadel, and being surrounded by a high and thick mud wall and a deep

BUMPKIN, a piece of timber projecting from each bow

of a ship to extend the clue of the fore-sail to windward; Bundeland also from each quarter, for the main brace-blocks.

BUNDELCUND, or the country of the Bundelas, an extensive province of Hindustan, bounded on the W. and N.W. by the dominions of Scindia; on the N.E. by the Jumna, dividing it from the Doab; on the E. by Rewa or Baghelcund; and on the S. by the Saugor and Nerbudda territories. It lies between Lat. 23. 52. and 26. 26. Long. 77. 53. and 81. 39., and contains an area of 18,089 square miles. The plains of Bundelcund are intersected by three mountain ranges, named respectively the Bindachal, Punna, and Bandair chains, the highest having an elevation in no place exceeding 2000 feet above the level of the sea. Beyond these ranges the country is further diversified by isolated hills of a remarkable character, rising abruptly from a common level, and presenting from their steep and nearly inaccessible scarps eligible sites for castles and strongholds, whence the mountaineers of Bundelcund have frequently set at defiance the most powerful of the native states of India.

The general slope of the country is towards the N.E., as indicated by the course of the rivers which traverse or bound the territory, and finally discharge themselves into the Jumna. The Sindh, rising near Sironj in Malwa, marks the frontier line of Bundelcund on the side of Gwalior. Parallel to this river, but more to the eastward, is the course of the Betwa. Still further to the east flows the Cane, followed in succession by the Baighin, Paisuni, and Tons. The province is further intersected by the tributaries of these rivers, but notwithstanding the large number of these streams, the depression of their channels, and height of their banks render them for the most part unsuitable for the purposes of irrigation,—recourse for which is constantly had to jheels and tanks. These artificial lakes are usually formed by throwing an embankment across the lower extremities of valleys, and thus arresting and accumulating the waters flowing through them. Some of these tanks are of great capacity; as, for instance, the Burwa Sagur, which is two miles and a half in diameter.

The mineral resources of this tract appear to be considerable. The most valuable of all fossils, diamonds, have been found, particularly near the town of Punna. The mines producing them are situated in a range of hills called by the natives Bund-Ahill, extending above twenty miles in length by between two and three in breadth, and are said to be partitioned into twenty-one divisions. Of these, the mines of Maharajepoor, Rajepoor, Kimmerah, and Guddaseah, contain the finest diamonds; and one dug from the last has been reputed the largest in the world. It was kept in the fort of Callinger, among other treasures of Rajah Himmut Bahadur. Several different rajahs are proprietors of the mines, each having the charge of his own, without any interest in the produce of the rest. In the reign of the emperor Acbar, the mines of Punna produced to the amount of L.100,000 annually, and were then a considerable source of revenue; but for many years they have not been nearly so profitable.

As already intimated, the country at a distance from the mountains is agreeably diversified with clusters of eminences or small hills, separate from each other, exhibiting a picturesque appearance; and the inhabitants invariably build their villages at the bottom of a hill. The arboreous vegetation consists rather of jungle or copse than forest, within which game abounds, and is preserved by the native chiefs. There are also within these coverts several varieties of wild animals, among which may be enumerated the tiger, leopard, hyena, wolf, wild boar, nilgaw (Antelope picta), and jackal.

The population is of various lineage. The Bundelasthe race who are always found in the capacity of chiefs, and who disdain to cultivate the soil—are represented

Bundel-

or morality. Among the Rajpoot Bundelas, rare examples of self-devotion are not indeed wanting, as instanced at Adjyghur upon its evacuation by the garrison, when besieged by the British. The removal of the family of the refractory zemindar who had occasioned hostilities having been directed, his father-in-law was desired to prepare the females of the family for it. Instead of doing so, however, he murdered the whole with their children, eight in number, and then put an end to his own life; and what was more extraordinary, the massacre to all appearance had been perpetrated with the consent of the victims; since those who watched without heard no noise to indicate that the sufferers had made resistance. Still, however, the Bundelas are stated to be infamous for treachery and cheating, and an Indian proverb avers, that "one native of Bundelcund commits as much fraud as a hundred Dhundees" (weighers of grain and notorious rogues). About Dhuttea and Jhansi they are a stout and handsome race of men, exhibiting an appearance of opulence and contentment. They commonly go armed with a bow and spear, both of which are of excellent quality; and they know very well how to use them. They testify no apprehension in engaging veteran troops. Owing to the intestine commotions which long pervaded this district, every man carried arms; and many, availing themselves of superior force, attacked and plundered travellers, or levied contributions from them on pretence of guarding the passes which they had necessarily to traverse among the hills. Besides the Rajpoots, there are the Brahminical Bundelas. The prevailing religion is Brahminism. One of its revolting observances, the practice of Suttee, formerly so prevalent, has at length been absolutely prohibited by the paramount power throughout the native states of Bundelcund.

Bundelcund is partly British and partly native territory. The British portion consists of the districts of Banda, Hummerpoor and Calpee, Jaloun, Jeitpore, Churgaon, and the ceded Pergunnalis of Duboi and Gurota, and comprises an area of 7181 square miles. The remainder, containing an area of 10,918 square miles, is distributed among thirty-three petty native states, the chief of which are Adjyghur, Bijawur, Churkaree, Chutterpoor, Dutteeah, Jhansi, Oorcha or Terree, Punnah, and Sumpthur. With these principalities the British government has entered into engagements, in which its supremacy is recognised by all. Some are tributary, others are exempt from pecuniary payment. The total population of the country, British and native, is returned at 2,260,714.

Chandra Varma, chief of the Chundel Rajpoots, appears to have established the earliest paramount power in Bundelcund towards the close of the ninth century. Under this dynasty the country attained its greatest splendour in the early part of the eleventh century, where its rajah, whose dominions extended from the Jumna to the Nerbudda, marched at the head of 36,000 horse and 45,000 foot, with 640 elephants, to oppose the invasion of Mahmood of Ghizni. In the year 1183, Parmal Deo, the twentieth ruler in succession from Chandra Varma, was overthrown by Pirthi Rajah, the ruler of Ajmere and Delhi; after which the country remained in ruinous anarchy until the close of the fourteenth century, when the Bundelas, a spurious offset of the Garwha tribe of Rajpoots, established themselves on the right bank of the Jumna. Early in the sixteenth century it is said that a Bundela, living in Benares, removed to a fort in the district of Oorcha, then governed by a rajah, whose confidence he speedily obtained. This Bundela had a daughter of exquisite beauty, of whom the rajah became enamoured, and demanded her in marriage. But her father, considering the proposal as a grievous insult from one whom certain circumstances now unknown prompted him to regard as his inferior in rank, he, in concert with his daughter, plotted a diabolical revenge. Acquiescence was given on the part

Bundel- as by no means conspicuous for lofty sentiments of honour of both; and the rajah was invited by his bride to the house of the Bundela, where the ceremony was to be performed. Here a magnificent entertainment was prepared, of which he partook plentifully along with his attendants; but it was soon succeeded by excruciating tortures; poison had been treacherously administered; and when the victims became incapable of defence, they were barbarously massacred. The Bundela then placed himself on the musnud of the rajah, which he enjoyed peaceably until his death. His great grandson, Birsing Deo, succeeded in further aggrandising the Bundela state, but he is represented to have been a notorious plunderer; and his character is further stained by the assassination of the celebrated Abul-Fazl, prime minister of Akbar, which is said to have been committed in compliance with the wishes of Jehangeer, the emperor's son, who was jealous of the Abul-Fazl's influence over his father. Jajhar Singh, the successor of Birsing Deo, having revolted against the court of Delhi, was driven into exile, and his country became incorporated with the empire. This arrangement, however, was merely temporary, and the struggles of the Bundelas for independence resulted in the withdrawal of the royal forces, and the admission of several petty states among the feudatories of the empire, on condition of military service. Descending to a later period, we find that this territory was invaded during the government of the rajah Chattersaul, about the middle of last century, by the chief of Furruckabad; and the rajah, to aid him in repelling the enemy, applied for support to the peishwa Sewai Bajerow. Success having attended them, he adopted Sewai Bajerow as his son, and partitioned Bundelcund between him and his own sons, allotting him a third of his dominions, the land revenue of which was estimated at about L.1,300,000 sterling; but under an express stipulation that his posterity should be protected by the peishwa in independent possession of the remainder. The rest of his male issue, said to exceed fifty, were in a state of dependence on their two brothers. In time this division opened the way to dissensions, a civil war ensued, and the consequent weakness of the chiefs afforded an opportunity for other invasions. Ali Bahauder, an illegitimate grandson of Bajerow, held a command in the army of Scindia, the noted Mahratta chief; and in the same army was the rajah Himmut Bahauder, who not only commanded a great body of cavalry, but was the spiritual head and military leader of a numerous sect of devotees, called Gosseins. In 1792 these two chiefs attempted the subjugation of Bundelcund. Their purpose, however, was but partially effected. An arrangement had been made with the peishwa, whereby he was acknowledged lord paramount of all the conquests effected in Bundelcund by Ali Bahauder, who engaged to obey him as his sovereign, and to pay him tribute. But the latter contrived to evade both conditions; and, after being occupied fourteen years in endeavouring to subjugate the country, died in 1802, during the blockade of Callinger, which, during ten years, he had fruitlessly endeavoured to capture. Ali was succeeded by his eldest son, Shumshere Bahauder, then absent at Poonah; and Himmut Bahauder, who, to retain his own influence, had for years been exciting disaffection among the different chiefs, now appointed a relation of Shumshere, the young rajah, regent of Bundelcund until his return. Almost immediately after the death of Ali Bahauder, the state of affairs assumed a totally different aspect by the flight of the peishwa from his capital to Bassein, and the treaty there concluded between that prince and the British government, by which the Bundelcund districts of Banda and Hummerpoor were transferred to the latter. Of the two chiefs who, while ostensibly yielding obedience to the peishwa, substantially held the ceded districts, Himmut Bahauder promoted the views of the British, while Shumshere made common cause with the Mahrattas against them. In September 1803, Colonel Powell crossed the river Jumna for the purpose of entering Bundelcund. Bunder
Abbas

Bunting.

and was joined by Himmut, with a body of thirteen or fourteen thousand men. The united forces, arriving on the banks of the river Cane, which passes the fort of Callinger and falls into the Jumna near the town of Oorcha, found the army of Shumshere on the opposite side. It was numerous, occupied a great extent, and was strongly posted; but after a short cannonade on both sides it precipitately retreated. Since this period military operations have occasionally been deemed indispensable to the firm establishment of the British power in Budelcund. In 1809 the fortress of Adjyghur was besieged by a British force. Three years later, the chief of the celebrated hill fort of Callinger having set the British authorities at defiance, it became necessary to invest the stronghold. This fort is built on a lofty rock, of great extent, and was formerly deemed by the natives to be impregnable. The walls are said to be six or seven miles in circuit; 170 pieces of cannon have been mounted on them; and a garrison of 5000 men was necessary for their defence. Nevertheless, its natural strength has enabled a smaller number to sustain long sieges; and the earlier invaders of Bundelcund have been compelled to retire, after unsuccessful blockades protracted during several years. The British force in attempting to take it by storm, was repulsed with great slaughter; but the garrison probably dreading a repetition of the assault, surrendered the place a few days afterwards. In 1817, by the treaty of Poonah, the British government acquired from the peishwa all his rights, interests, and pretensions, feudal, territorial, or pecuniary, in Bundelcuad. In carrying out the provisions of the treaty, an assurance was given by the British government that the rights of those interested in the transfer should be scrupulously respected; and the host of petty native principalities, by which the province is interlaced, is the best proof of the sincerity and good faith in which it

BÜNDER ABBAS. See Gombroon.

BUNEL, PIERRE, one of the most elegant writers of his time, was born at Toulouse in 1499, and died at Turin in 1546. He left behind him some Latin epistles, Epistolæ Ciceroniano Stylo Scriptæ, remarkable for the elegance and purity with which they are written. "Bunel," says Bayle, "was an honest man, the very person whom Diogenes wanted. His letters are written with the greatest purity, and contain curious facts." They were first published by Charles Stevens in 1551, and afterwards by Henry Stevens in 1581, a scarce edition. Another, but less correct edition, appeared at Toulouse in 1687, by J. Graverol.

BUNGALOW, the name given in India to a house or villa of a single floor. *Dah-Bungalows* are thatched houses constructed at the public expense, and placed at intervals, in many parts of India, for the accommodation of

travellers.

BUNGAY, a market-town in the county of Suffolk, 109 miles from London. It is a well-built town, comprising two parishes with their churches, and the ruins of an ancient monastery and of a castle. A considerable trade is carried on in corn, malt, flour, coal, lime, &c. by means of the river Waveney, which almost surrounds the town and common in the form of a horse-shoe, and which is navigable to the sea at Yarmouth. It has an octagonal market-house and cross, assembly rooms, savings-bank, baths, dispensary, alms-houses, and grammar-school with 4 scholarships at Emmanuel College, Cambridge. Market-day Thursday. Pop. (1851) 3841.

BUNKER HILL, a small elevation 110 feet high in the town of Charlestown, one mile north of Boston, in Massachusetts. One of the most celebrated battles in the war of American Independence was fought here on the 17th of June 1775. The British remained masters of the field after a long and bloody contest.

BUNTING. See Ornithology, Index.

grammar-school with 4 exhibitions of L.12 each at Christ's

flags and signals of ships.

BUNTINGFORD, a small market-town, with only a few hundred inhabitants, in the hundred of Edwinstree, county of Hertford, 31 miles north of London. It has a

College, Cambridge.

BUNYAN, JOHN, the most popular religious writer in the English language, was born at Elstow, about a mile from Bedford, in the year 1628. He may be said to have been born a tinker. The tinkers then formed a hereditary caste, which was held in no high estimation. They were generally vagrants and pilferers, and were often confounded with the gipsies, whom in truth they nearly resembled. Bunyan's father was more respectable than most of the tribe. He had a fixed residence, and was able to send his son to a village school where reading and writing were taught.

The years of John's boyhood were those during which the puritan spirit was in the highest vigour all over England; and nowhere had that spirit more influence than in Bedfordshire. It is not wonderful, therefore, that a lad to whom nature had given a powerful imagination and sensibility which amounted to a disease, should have been early haunted by religious terrors. Before he was ten, his sports were interrupted by fits of remorse and despair; and his sleep was disturbed by dreams of fiends trying to fly away with him. As he grew older, his mental conflicts became still more violent. The strong language in which he described them has strangely misled all his biographers except Mr Southey. It has long been an ordinary practice with pious writers to cite Bunyan as an instance of the supernatural power of divine grace to rescue the numan soul from the lowest depths of wickedness. He is called in one book the most notorious of profligates; in another, the brand plucked from the burning. He is designated in Mr Iviniey's History of the Baptists as the depraved Bunyan, the wicked tinker of Elstow. Mr Ryland, a man once of great note among the Dissenters, breaks out into the following rhapsody:-" No man of common sense and common integrity can deny that Bunyan was a practical atheist, a worthless contemptible infidel, a vile rebel to God and goodness, a common profligate, a soul-despising, a soul-murdering, a soul-damning, thoughtless wretch as could exist on the face of the earth. Now be astonished, O heavens, to eternity! and wonder, O earth and hell! while time endures. Behold this very man become a miracle of mercy, a mirror of wisdom, goodness, holiness, truth, and love." But whoever takes the trouble to examine the evidence will find that the good men who wrote this had been deceived by a phraseology which, as they had been hearing it and using it all their lives, they ought to have understood better. There cannot be a greater mistake than to infer from the strong expressions in which a devout man bemoans his exceeding sinfulness, that he has led a worse life than his neighbours. Many excellent persons, whose moral character from boyhood to old age has been free from any stain discernible to their fellow creatures, have, in their autobiographies and diaries, applied to themselves, and doubtless with sincerity, epithets as severe as could be applied to Titus Oates or Mrs Brownrigg. It is quite certain that Bunyan was, at eighteen, what, in any but the most austerely puritanical circles, would have been considered as a young man of singular gravity and innocence. Indeed, it may be remarked that he, like many other penitents who, in general terms, acknowledge themselves to have been the worst of mankind, fired up, and stood vigorously on his defence, whenever any particular charge was brought against him by others. He declares, it is true, that he had let loose the reins on the neck of his lusts, that he had delighted in all transgressions against the divine law, and that he had been the ringleade. of the youth of Elstow in all manner of vice. But when

Bunyan. those who wished him ill accused him of licentious amours, ✓ he called on God and the angels to attest his purity. No woman, he said, in heaven, earth, or hell, could charge him with having ever made any improper advances to her. Not only had he been strictly faithful to his wife; but he had, even before his marriage, been perfectly spotless. It does not appear from his own confessions, or from the railings of his enemies, that he ever was drunk in his life. One bad habit he contracted, that of using profane language; but he tells us that a single reproof cured him so effectually that he never offended again. The worst that can be laid to the charge of this poor youth, whom it has been the fashion to represent as the most desperate of reprobates, as a village Rochester, is that he had a great liking for some diversions, quite harmless in themselves, but condemned by the rigid precisians among whom he lived, and for whose opinion he had a great respect. The four chief sins of which he was guilty were dancing, ringing the bells of the parish church, playing at tipcat, and reading the History of Sir Bevis of Southampton. A Rector of the school of Laud would have held such a young man up to the whole parish as a model. But Bunyan's notions of good and evil had been learned in a very different school; and he was made miserable by the conflict between his tastes and his scruples.

When he was about seventeen, the ordinary course of his life was interrupted by an event which gave a lasting colour to his thoughts. He enlisted in the parliamentary army, and served during the decisive campaign of 1645. All that we know of his military career is that, at the siege of Leicester, one of his comrades, who had taken his post, was killed by a shot from the town. Bunyan ever after considered himself as having been saved from death by the special interference of Providence. It may be observed, that his imagination was strongly impressed by the glimpse which he had caught of the pomp of war. To the last he loved to draw his illustrations of sacred things from camps and fortresses, from guns, drums, trumpets, flags of truce, and regiments arrayed, each under its own banner. His Greatheart, his Captain Boanerges, and his Captain Credence, are evidently portraits, of which the originals were among those martial saints who fought and expounded in Fairfax's army.

In a few months Bunyan returned home, and married. His wife had some pious relations, and brought him as her only portion some pious books. And now his mind, excitable by nature, very imperfectly disciplined by education, and exposed, without any protection, to the infectious virulence of the enthusiasm which was then epidemic in England, began to be fearfully disordered. In outward things he soon became a strict Pharisee. He was constant in attendance at prayers and sermons. His favourite amusements were, one after another, relinquished, though not without many painful struggles. In the middle of a game at tipcat he paused, and stood staring wildly upwards with his stick in his hand. He had heard a voice asking him whether he would leave his sins and go to heaven, or keep his sins and go to hell; and he had seen an awful countenance frowning on him from the sky. The odious vice of bell-ringing he renounced; but he still for a time ventured to go to the church tower and look on while others pulled the ropes. But soon the thought struck him that, if he persisted in such wickedness, the steeple would fall on his head; and he fled in terror from the accursed place. To give up dancing on the village green was still harder; and some months elapsed before he had the fortitude to part with this darling sin. When this last sacrifice had been made, he was, even when tried by the maxims of that austere time, faultless. All Elstow talked of him as an eminently pious youth. But his own mind was more unquiet than ever. Having nothing more to do in the way of visible reformation, yet finding in religion no pleasures to supply the place of the juvenile amusements which he had relinquished, he began to apprehend that he

lay under some special malediction; and he was tormented Bunyanby a succession of fantasies which seemed likely to drive him to suicide or to Bedlam.

At one time he took it into his head that all persons of Israelite blood would be saved, and tried to make out that he partook of that blood; but his hopes were speedily destroyed by his father, who seems to have had no ambition to be regarded as a Jew.

At another time Bunyan was disturbed by a strange dilemma: "If I have not faith, I am lost; if I have faith, I can work miracles." He was tempted to cry to the puddles between Elstow and Bedford, "Be ye dry," and to stake his eternal hopes on the event.

Then he took up a notion that the day of grace for Bedford and the neighbouring villages was passed; that all who were to be saved in that part of England were already converted; and that he had begun to pray and strive some months too late.

Then he was harassed by doubts whether the Turks were not in the right, and the Christians in the wrong. Then he was troubled by a maniacal impulse which prompted him to pray to the trees, to a broomstick, to the parish bull. As vet, however, he was only entering the Valley of the Shadow of Death. Soon the darkness grew thicker. Hideous forms floated before him. Sounds of cursing and wailing were in his ears. His way ran through stench and fire, close to the mouth of the bottomless pit. He began to be haunted by a strange curiosity about the unpardonable sin, and by a morbid longing to commit it. But the most frightful of all the forms which his disease took was a propensity to utter blasphemy, and especially to renounce his share in the benefits of the redemption. Night and day, in bed, at table, at work, evil spirits, as he imagined, were repeating close to his ear the words, "Sell him, sell him." He struck at the hobgoblins; he pushed them from him; but still they were ever at his side. He cried out in answer to them, hour after hour, "Never, never; not for thousands of worlds; not for thousands." At length, worn out by this long agony, he suffered the fatal words to escape him, "Let him go, if he will." Then his misery became more fearful than ever. He had done what could not be forgiven. He had forfeited his part of the great sacrifice. Like Esau, he had sold his birthright; and there was no longer any place for repentance. "None," he afterwards wrote, "knows the terrors of those days but myself." He has described his sufferings with singular energy, simplicity, and pathos. He envied the brutes; he envied the very stones in the street, and the tiles on the houses. The sun seemed to withhold its light and warmth from him. His body, though cast in a sturdy mould, and though still in the highest vigour of youth, trembled whole days together with the fear of death and judgment. He fancied that this trembling was the sign set on the worst reprobates, the sign which God had put on Cain. The unhappy man's emotion destroyed his power of digestion. He had such pains that he expected to burst asunder like Judas, whom he regarded as his prototype.

Neither the books which Bunyan read, nor the advisers whom he consulted, were likely to do much good in a case like his. His small library had received a most unseasonable addition, the account of the lamentable end of Francis Spira. One ancient man of high repute for piety, whom the sufferer consulted, gave an opinion which might well have produced fatal consequences. "I am afraid," said Bunyan, "that I have committed the sin against the Holy Ghost." "Indeed," said the old fanatic, "I am afraid that you have."

At length the clouds broke; the light became clearer and clearer; and the enthusiast, who had imagined that he was branded with the mark of the first murderer, and destined to the end of the arch traitor, enjoyed peace and a cheerful confidence in the mercy of God. Years elapsed, however, before his nerves, which had been so perilously

Bunyan. overstrained, recovered their tone. When he had joined a Baptist society at Bedford, and was for the first time admitted to partake of the Eucharist, it was with difficulty that he could refrain from imprecating destruction on his brethren while the cup was passing from hand to hand. After he had been some time a member of the congregation, he began to preach; and his sermons produced a powerful effect. He was indeed illiterate; but he spoke to illiterate men. The severe training through which he had passed had given him such an experimental knowledge of all the modes of religious melancholy as he could never have gathered from books; and his vigorous genius, animated by a fervent spirit of devotion, enabled him not only to exercise a great influence over the vulgar, but even to extort the half contemptuous admiration of scholars. Yet it was long before he ceased to be tormented by an impulse which urged him to utter words

of horrible impiety in the pulpit.

Counter-irritants are of as great use in moral as in physical diseases. It should seem that Bunyan was finally relieved from the internal sufferings which had embittered his life by sharp persecution from without. He had been five years a preacher, when the Restoration put it in the power of the Cavalier gentlemen and clergymen all over the country to oppress the Dissenters; and, of all the Dissenters whose history is known to us, he was perhaps the most hardly treated. In November 1660, he was flung into Bedford gaol; and there he remained, with some intervals of partial and precarious liberty, during twelve years. His persecutors tried to extort from him a promise that he would abstain from preaching; but he was convinced that he was divinely set apart and commissioned to be a teacher of righteousness, and he was fully determined to obey God rather than man. He was brought before several tribunals, laughed at, caressed, reviled, menaced, but in vain. He was facetiously told that he was quite right in thinking that he ought not to hide his gift; but that his real gift was skill in repairing old kettles. He was compared to Alexander the coppersmith. He was told that, if he would give up preaching, he should be instantly liberated. He was warned that, if he persisted in disobeying the law, he would be liable to banishment, and that, if he were found in England after a certain time, his neck would be stretched. His answer was, "If you let me out to-day, I will preach again to-morrow." Year after year he lay patiently in a dungeon, compared with which the worst prison now to be found in the island is a palace. His fortitude is the more extraordinary, because his domestic feelings were unusually strong. Indeed, he was considered by his stern brethren as somewhat too fond and indulgent a parent. He had several small children, and among them a daughter who was blind, and whom he loved with peculiar tenderness. He could not, he said, bear even to let the wind blow on her; and now she must suffer cold and hunger; she must beg; she must be beaten; "yet," he added, "I must, I must do it." While he lay in prison he could do nothing in the way of his old trade for the support of his family. He determined, therefore to take up a new trade. He learned to make long tagged thread laces; and many thousands of these articles were furnished by him to the hawkers. While his hands were thus busied, he had other employment for his mind and his lips. He gave religious instruction to his fellow-captives, and formed from among them a little flock, of which he was himself the pastor. He studied indefatigably the few books which he possessed. His two chief companions were the Bible and Fox's Book of Martyrs. His knowledge of the Bible was such that he might have been called a living concordance; and on the margin of his copy of the Book of Martyrs are still legible the ill spelt lines of doggrel in which he expressed his reverence for the brave sufferers, and his implacable enmity to the mystical Babylon.

At length he began to write, and, though it was some

time before he discovered where his strength lay, his writ- Bunyan. ings were not unsuccessful. They were coarse, indeed, but they showed a keen mother wit, a great command of the homely mother tongue, an intimate knowledge of the English Bible, and a vast and dearly bought spiritual experience. They therefore, when the corrector of the press had improved the syntax and the spelling, were well received by the humbler class of Dissenters.

Much of Bunyan's time was spent in controversy. He wrote sharply against the Quakers, whom he seems always to have held in utter abhorrence. It is, however, a remarkable fact that he adopted one of their peculiar fashions: his practice was to write, not November or December, but

eleventh month and twelfth month.

He wrote against the liturgy of the Church of England. No two things, according to him, had less affinity than the form of prayer and the spirit of prayer. Those, he said with much point, who have most of the spirit of prayer are all to be found in gaol; and those who have most zeal for the form of prayer are all to be found at the alehouse. The doctrinal articles, on the other hand, he warmly praised, and defended against some Arminian clergymen who had signed them. The most acrimonious of all his works is his answer to Edward Fowler, afterwards bishop of Gloucester, an excellent man, but not free from the taint of Pela-

Bunyan had also a dispute with some of the chiefs of the sect to which he belonged. He doubtless held with perfect sincerity the distinguishing tenet of that sect, but he did not consider that tenet as one of high importance, and willingly joined in communion with pious Presbyterians and Independents. The sterner Baptists, therefore, loudly pronounced him a false brother. A controversy arose which long survived the original combatants. In our own time the cause which Bunyan had defended with rude logic and rhetoric against Kiffin and Danvers was pleaded by Robert Hall with an ingenuity and eloquence such as no polemical writer has ever surpassed.

During the years which immediately followed the Restoration, Bunyan's confinement seems to have been strict. But as the passions of 1660 cooled, as the hatred with which the Puritans had been regarded while their reign was recent gave place to pity, he was less and less harshly treated. The distress of his family, and his own patience, courage, and piety, softened the hearts of his persecutors. Like his own Christian in the cage, he found protectors even among the crowd of Vanity Fair. The Bishop of the diocese, Dr Barlow, is said to have interceded for him. At length the prisoner was suffered to pass most of his time beyond the walls of the gaol, on condition, as it should seem, that he remained within the town of Bedford.

He owed his complete liberation to one of the worst acts of one of the worst governments that England has ever seen. In 1671 the Cabal was in power. Charles II. had concluded the treaty by which he bound himself to set up the Roman Catholic religion in England. The first step which he took towards that end was to annul, by an unconstitutional exercise of his prerogative, all the penal statutes against the Roman Catholics; and, in order to disguise his real design, he annulled at the same time the penal statutes against Protestant nonconformists. Bunyan was consequently set at large. In the first warmth of his gratitude he published a tract in which he compared Charles to that humane and generous Persian king who, though not himself blessed with the light of the true religion, favoured the chosen people, and permitted them, after years of captivity, to rebuild their beloved temple. To candid men, who consider how much Bunyan had suffered, and how little he could guess the secret designs of the court, the unsuspicious thankfulness with which he accepted the precious boon of freedom will not appear to require any apology.

Bunyan.

Before he left his prison he had begun the book which has made his name immortal. The history of that book is remarkable. The author was, as he tells us, writing a treatise, in which he had occasion to speak of the stages of the Christian progress. He compared that progress, as many others had compared it, to a pilgrimage. Soon his quick wit discovered innumerable points of similarity which had escaped his predecessors. Images came crowding on his mind faster than he could put them into words, quagmires and pits, steep hills, dark and horrible glens, soft vales. sunny pastures, a gloomy castle of which the courtyard was strewn with the skulls and bones of murdered prisoners, a town all bustle and splendour, like London on the Lord Mayor's Day, and the narrow path, straight as a rule could make it, running on up hill and down hill, through city and through wilderness, to the Black River and the Shining Gate. He had found out, as most people would have said, by accident, as he would doubtless have said, by the guidance of Providence, where his powers lay. He had no suspicion, indeed, that he was producing a masterpiece. He could not guess what place his allegory would occupy in English literature; for of English literature he knew nothing. Those who suppose him to have studied the Fairy Queen might easily be confuted, if this were the proper place for a detailed examination of the passages in which the two allegories have been thought to resemble each other. The only work of fiction, in all probability, with which he could compare his Pilgrim, was his old favourite, the legend of Sir Bevis of Southampton. He would have thought it a sin to borrow any time from the serious business of his life, from his expositions, his controversies, and his lace tags, for the purpose of amusing himself with what he considered merely as a trifle. It was only, he assures us, at spare moments that he returned to the House Beautiful, the Delectable Mountains, and the Enchanted Ground. He had no assistance. Nobody but himself saw a line till the whole was complete. He then consulted his pious friends. were pleased. Others were much scandalized. It was a vain story, a mere romance, about giants, and lions, and goblins, and warriors, sometimes fighting with monsters, and sometimes regaled by fair ladies in stately palaces. The loose atheistical wits at Will's might write such stuff to divert the painted Jezebels of the court: but did it become a minister of the gospel to copy the evil fashions of the world? There had been a time when the cant of such fools would have made Bunyan miserable. But that time was passed; and his mind was now in a firm and healthy state. He saw that, in employing fiction to make truth clear and goodness attractive, he was only following the example which every Christian ought to propose to himself; and he determined to print.

The Pilgrim's Progress stole silently into the world. Not a single copy of the first edition is known to be in existence. The year of publication has not been ascertained. It is probable that, during some months, the little volume circulated only among poor and obscure sectaries. But soon the irresistible charm of a book which gratified the imagination of the reader with all the action and scenery of a fairy tale, which exercised his ingenuity by setting him to discover a multitude of curious analogies, which interested his feelings for human beings, frail like himself, and struggling with temptations from within and from without, which every moment drew a smile from him by some stroke of quaint yet simple pleasantry, and nevertheless left on his mind a sentiment of reverence for God and of sympathy for man, began to produce its effect. In puritanical circles, from which plays and novels were strictly excluded, that effect was such as no work of genius, though it were superior to the Iliad, to Don Quixote, or to Othello, can ever produce on a mind accustomed to indulge in literary luxury. In 1678 came forth a second edition with additions; and

then the demand became immense. In the four following Bunyan. years the book was reprinted six times. The eighth edition, which contains the last improvements made by the author, was published in 1682, the ninth in 1684, the tenth in 1685. The help of the engraver had early been called in; and tens of thousands of children looked with terror and delight on execrable copperplates, which represented Christian thrusting his sword into Apollyon, or writhing in the grasp of Giant Despair. In Scotland, and in some of the colonies, the Pilgrim was even more popular than in his native country. Bunyan has told us, with very pardonable vanity, that in New England his dream was the daily subject of the conversation of thousands, and was thought worthy to appear in the most superb binding. He had numerous admirers in Holland, and among the Huguenots of France. With the pleasures, however, he experienced some of the pains of eminence. Knavish booksellers put forth volumes of trash under his name, and envious scribblers maintained it to be impossible that the poor ignorant tinker should really be the author of the book which was called his.

He took the best way to confound both those who counterfeited him and those who slandered him. He continued to work the Gold-field which he had discovered, and to draw from it new treasures, not indeed with quite such ease and in quite such abundance as when the precious soil was still virgin, but yet with success which left all competition far behind. In 1684 appeared the second part of the *Pilgrim's Progress*. It was soon followed by the *Holy War*, which, if the *Pilgrim's Progress* did not exist, would be the best allegory that ever was written.

Bunyan's place in society was now very different from what it had been. There had been a time when many Dissenting ministers, who could talk Latin and read Greek, had affected to treat him with scorn. But his fame and influence now far exceeded theirs. He had so great an authority among the Baptists that he was popularly called Bishop Bunyan. His episcopal visitations were annual. From Bedford he rode every year to London, and preached there to large and attentive congregations. From London he went his circuit through the country, animating the zeal of his brethren, collecting and distributing alms, and making up quarrels. The magistrates seem in general to have given him little trouble. But there is reason to believe that, in the year 1685, he was in some danger of again occupying his old quarters in Bedford gaol. In that year the rash and wicked enterprise of Monmouth gave the government a pretext for prosecuting the nonconformists; and scarcely one eminent divine of the Presbyterian, Independent, or Baptist persuasion remained unmolested. Baxter was in prison: Howe was driven into exile: Henry was arrested. Two eminent Baptists, with whom Bunyan had been engaged in controversy, were in great peril and distress. Danvers was in danger of being hanged; and Kiffin's grandsons were actually hanged. The tradition is that, during those evil days, Bunyan was forced to disguise himself as a waggoner, and that he preached to his congregation at Bedford in a smock-frock, with a cart-whip in his hand. But soon a great change took place. James the Second was at open war with the church, and found it necessary to court the Dissenters. Some of the creatures of the government tried to secure the aid of Bunyan. They probably knew that he had written in praise of the indulgence of 1672, and therefore hoped that he might be equally pleased with the indulgence of 1687. But fifteen years of thought, observation, and commerce with the world had made him wiser. Nor were the cases exactly parallel. Charles was a professed Protestant: James was a professed Papist. The object of Charles's indulgence was disguised: the object of James's indulgence was patent. Bunyan was not deceived. He exhorted his hearers to prepare themselves by fasting and prayer for the danger which menaced

Bunyan. their civil and religious liberties, and refused even to speak to the courtier who came down to remodel the corporation of Bedford, and who, as was supposed, had it in charge to offer some municipal dignity to the Bishop of the Baptists.

Bunyan did not live to see the Revolution. In the summer of 1688 he undertook to plead the cause of a son with an angry father, and at length prevailed on the old man not to disinherit the young one. This good work cost the benevolent intercessor his life. He had to ride through heavy rain. He came drenched to his lodgings on Snow Hill, was seized with a violent fever, and died in a few days. He was buried in Bunhill Fields; and the spot where he lies is still regarded by the nonconformists with a feeling which seems scarcely in harmony with the stern spirit of their theology. Many puritans to whom the respect paid by Roman Catholics to the reliques and tombs of saints seemed childish or sinful, are said to have begged with their dying breath that their coffins might be placed as near as possible to the coffin of the author of the Pilgrim's Progress.

The fame of Bunyan during his life, and during the century which followed his death, was indeed great, but was almost entirely confined to religious families of the middle and lower classes. Very seldom was he during that time mentioned with respect by any writer of great literary eminence. Young coupled his prose with the poetry of the wretched D'Urfey. In the Spiritual Quixote, the adventures of Christian are ranked with those of Jack the Giant-Killer and John Hickathrift. Cowper ventured to praise the great allegorist, but did not venture to name him. It is a significant circumstance that, till a recent period, all the numerous editions of the *Pilgrim's Progress* were evidently meant for the cottage and the servant's hall. The paper, the printing, the plates, were all of the meanest description. In general, when the educated minority and the common people differ about the merit of a book, the opinion of the educated minority finally prevails. The Pilgrim's *Progress* is perhaps the only book about which, after the lapse of a hundred years, the educated minority has come

over to the opinion of the common people. The attempts which have been made to improve and to imitate this book are not to be numbered. It has been done into verse: it has been done into modern English. The Pilgrimage of Tender Conscience, the Pilgrimage of Good Intent, the Pilgrimage of Seek Truth, the Pilgrimage of Theophilus, the Infant Pilgrim, the Hindoo Pilgrim, are among the many feeble copies of the great original. But the peculiar glory of Bunyan is that those who most hated his doctrines have tried to borrow the help of his genius. A Catholic version of his parable may be seen with the head of the Virgin in the title page. On the other hand, those Antinomians for whom his Calvinism is not strong enough, may study the pilgrimage of Hephzibah, in which nothing will be found which can be construed into an admission of free agency and universal redemption. But the most extraordinary of all the acts of Vandalism by which a fine work of art was ever defaced was committed so late as the year 1853. It was determined to transform the *Pilgrim's* Progress into a Tractarian book. The task was not easy: for it was necessary to make the two sacraments the most prominent objects in the allegory; and of all Christian theologians, avowed Quakers excepted, Bunyan was the one in whose system the sacraments held the least prominent place. However, the Wicket Gate became a type of baptism, and the House Beautiful of the Eucharist. The effect of this change is such as assuredly the ingenious person who made it never contemplated. For, as not a single pilgrim passes through the Wicket Gate in infancy, and as Faithful hurries past the House Beautiful without stopping, the lesson which the fable in its altered shape teaches, is that none but adults ought to be baptized, and that the Eucha-

rist may safely be neglected. Nobody would have discovered Bunzlau from the original Pilgrim's Progress that the author was not a Pædobaptist. To turn his book into a book against Pædo-Buphonia. baptism was an achievement reserved for an Anglo-Catholic divine. Such blunders must necessarily be committed by every man who mutilates parts of a great work, without taking a comprehensive view of the whole.

BUNZLAU, the capital of a circle of the same name in the government of Liegnitz in Prussian Silesia. It is situated on the Bober, 24 miles W.N.W. of Liegnitz, and in 1849 had 6668 inhabitants. It has a hospital, orphan asylum, several churches and schools, and manufactures of linens, woollens, hosiery, earthenware, &c. In the market-place is a monument to the Russian general Kutusoff, who died there in 1813.

Bunzlau, Jung, or New Bunzlau, the capital of the circle of Bunzlau in Bohemia, stands on the left bank of the Iser, a tributary of the Elbe, 32 miles N.E. of Prague. It has considerable manufactures of cotton and woollen goods, leather, &c., and about 5100 inhabitants.

BUOY, a close empty cask, or a block of wood or cork, fastened by a rope to an anchor, and floating on the water, to show where the anchor is situated. Buoys are of various kinds: as can-buoys, in the form of a cone; nun-buoys, which swell in the middle, and taper to a point at each end; cable-buoys, empty casks, employed to buoy up the cable in rocky anchorage. Buoys are also used to indicate the position of rocks and shoals, or to mark a channel.

The *life-buoy*, of which there are various kinds, is used to throw overboard to preserve a person from drowning. The kind now commonly used in the navy consists of two hollow copper vessels connected together, between which there is fixed a hollow pole, with a port-fire fixed to its top. This apparatus, which is properly ballasted, is suspended so as to be ready for use at a moment's notice; and it is so contrived that by the act of letting it off the port-fire is ignited; thus enabling the person in the water to discern the buoy in the darkest night.

BUPALUS, a celebrated sculptor of the island of Chios, was the son, grandson, and great grandson of sculptors. Bupalus, and his brother Athenis, who was likewise a sculptor, flourished about B.C. 500, being contemporary with the poet Hipponax, whom they caricatured. (Pliny.) Augustus adorned many of the temples at Rome with their works, which were executed in the white marble of Paros. Bupalus is mentioned by Pausanias as a good architect as well as sculptor.

BUPHONIA, or DIPOLEIA, or DIPOLIA, a festival of great antiquity, celebrated annually on the acropolis of Athens, on the 14th of the month Scirophorion (June); on which occasion an ox was sacrificed in honour of Zeus (Jupiter). The origin of the Buphonia is related as follows: -In the reign of Erechtheus, at the celebration of the Dionysia, or according to the Scholiast on Aristophanes at the Diipolia, an ox ate the corn or cakes which had been prepared for the sacrifice; at which one Thaulon, or Baulon (or according to others the βουφόνος, one of the priests thus designated), was so incensed that he killed the animal, and immediately took to flight. The Athenians, dreading the resentment of the gods, and feigning themselves ignorant of the guilty person, brought the bloody axe before the judges, by whom it was solemnly arraigned, tried, found guilty, and condemned. In memory of this event a festival was instituted under the name of Buphonia, in which it was customary for the priest to fly, and judgment to be given respecting the slaughter of the ox. (Porphyrius, De Abstinent. ii.)

It may be observed, that this legend carries us back to that early period of Grecian history when it had not yet become customary to offer up living victims on the altars of the gods.

BURBOT. See ICHTHYOLOGY, Index.

BURCKHARDT, John Ludwig, celebrated for his extensive journeys in the East, was descended from an ancient family in Switzerland, who had been long established at Kirchgarten, near Lausanne. His father, John Rudolph, had been tried by a French military commission on a charge of having delivered up the tête du pont at Hunningen to the Austrians, and, though acquitted, received such treatment from the French republican authorities as made a lasting impression on his mind, and induced him to remove his family from the territories where their power predominated, and to establish them at Basle. He then entered into a Swiss corps in the service of England.

John Ludwig, the eighth son, was born at Lausanne in 1784. Having acquired the usual classical instruction at Neufchâtel, he was placed at the university of Leipzig; and, after a residence there of two years, he concluded his studies at Gottingen. During his residence at the latter seat of learning, his talents, application, and good conduct, had gained him the esteem and respect of the professors, but especially of the celebrated Blumenbach. When he resolved on proceeding to England, Blumenbach gave him a letter of introduction to Sir Joseph Banks, who, with the other members of the African Association to whom he was introduced, accepted his offer of travelling to explore the interior of Africa. After the plan of his journey had been settled, he diligently prepared himself for it by application to those studies which were most appropriate. He passed his time partly in London and partly at Cambridge in acquiring a knowledge of astronomy, chemistry, mineralogy, medicine, and surgery. He suffered his beard to grow, accustomed himself to the dress and manners of the East, inured himself to all kinds of hardships and privations, and diligently learned to read, write, and speak the Arabic language; in all which pursuits he was much assisted by Browne, who during his travels in Africa had acquired a perfect knowledge of the languages and customs of Mahommedan nations.

After these preparations, having received his instructions from the society, he left England, and in April 1809 reached Malta; whence he proceeded, in the following October, to Aleppo. Being determined to acquire the Arabic language in perfection, he appeared there as a Mussulman under the name of Sheihk Ibrahim Ibn Abdallah; and, during more than two years passed in that part of Asia, he had so perfected himself in the language as not to be distinguished from the natives, and acquired such accurate knowledge of the contents of the Koran, and of the commentaries upon its religion and laws, that after a critical examination, the most learned Mussulman entertained no doubt of his being really what he professed to be, a learned doctor of their law.

During his residence in Syria he visited Palmyra, Damascus, Lebanon, and the other parts of that interesting country, and thence repaired to Cairo in Egypt, with the intention of joining a caravan, and travelling to Fezzan, in the north of Africa. In 1812, whilst waiting for the departure of the caravan, he undertook a journey to the Nile, as far up as Mahass; and then, in the character of a poor Syrian merchant, he made a journey through the Nubian desert which Bruce had traversed, passing by Berber and Shendy to Suakim, on the Red Sea; whence he performed the pilgrimage to Mecca by way of Jidda. In this journey he endured privations and sufferings of the severest kind. He returned thence to Cairo in a state of great exhaustion; but in the spring of 1816, he travelled to Mount Sinai, whence he returned to Cairo in June, and there made preparations for his intended journey to Fezzan, and to explore the sources of the Niger. Several hindrances prevented his prosecuting this intention, till at length, in April 1817, when the long-expected caravan prepared to depart, he was

seized with an illness which ended his life. He had trom time to time carefully transmitted his journals and remarks, and a very copious series of letters; so that nothing which appeared to him to be interesting in the various journeys he made has been lost.

The communications from Burckhardt were laid, from time to time, before the public with appropriate maps; and much light has been thrown by them on the geography of the countries he visited, and on the manners, laws, religion, and commerce of their inhabitants. His Journey along the Banks of the Nile from Assouan to Mahass, on the Frontier of Dongola, was published in 1819, in 4to; and the volume also contained a description of a Journey from Upper Egypt through the Deserts of Nubia to Jidda in Arabia. To this is added an Appendix, with an Itinerary from the Frontiers of Bornou and by Bahr el Ghazal and Darfour to Shendy; and notices of the country of Soudan, west of Darfour, with vocabularies of the several languages.

In 1822 a volume was pullished containing a Tour from Damascus in the countries of Libanus and Anti-Libanus; a Journal of an Excursion into the Haouran in 1810; a Journey from Aleppo to Damascus in 1812; a Journey from Damascus into the Haouran in 1811; a Journey from Damascus through the Mountains of Arabia Petræa in 1812; and a Journal of a Tour in the Peninsula of Mount Sinai in 1816. In 1829 was published a posthumous volume of Travels in Arabia, in 4to (2 vols. 8vo); and in 1830 another volume, in 4to, entitled Manners and Customs of the Egyptians. (w. J.)

BURDEN, or BURDON (French bourdon, a drone), in Music, the drone, or bass, and the pipe or string which plays it; hence applied to that part of a song which is repeated at the end of every stanza. A chord which is divided so as to perform the intervals of music, when open and undivided, is also called the burden.

Burden, or Burthen (Saxon byrden, or byrthen), a fixed quantity of any commodity for transit.

BURDEN of a Ship, its contents, or the number of tons it will carry. See Tonnage.

BURDER, George, one of the founders of the London Missionary Society, was born in 1752. He was for twenty years minister of the West Orchard Chapel at Coventry. At the end of this period he removed to London, where for twenty-nine years he officiated at the Fetter Lane Chapel. For many years he performed gratuitously the duties of secretary to the London Missionary Society, and edited with much success the Evangelical Magazine. He is chiefly remembered now as the author of the Village Sermons, which appeared at intervals from 1799 to 1812, and were at last completed in six volumes. He edited many works, and among them the Pilgrim's Progress; Collin's Weaver's Pocket-Book, or Weaving Spiritualized; and Henry's Bible with Improvements. He died at London in 1832 in the eightieth year of his age.

BURDETT, SIR FRANCIS, Baronet, was born January 25, 1770. The rudiments of his education he received at Westminster School, whence he removed in due time to Oxford. He did not wait to graduate at that university, but in 1790 set out on a Continental tour, in the course of which he became strongly imbued with the revolutionary principles then dominant in France and other countries. On his return to England in 1793 he married the youngest daughter of Mr Coutts, a wealthy banker, with whom he received a large fortune. Through the influence of the Duke of Newcastle he was chosen M.P. for Boroughbridge, on which occasion he had as colleague Mr Scott, afterwards Lord Eldon. At the outset of his political career he was a zealous supporter of ultra-liberal measures. In 1802, after a protracted contest, he was elected M.P. for Middlesex, in opposition to the former member Mr Mainwaring. The election however was declared void, and in the subsequent

Burden || Burdett.

Burdwan canvass he was defeated. In 1806 he again stood for Middlesex and was again defeated, but when he stood for Westminster in the same year he was elected by a large majority. The obstinate violence with which he opposed the existing government hurried him into indiscretions, which ended in his committal to the Tower. The mob, with whom his popularity was unbounded, endeavoured to rescue him, and some lives were lost in the unsuccessful attempt. At the prorogation of parliament he was released, and lost no time in prosecuting the Speaker and the Sergeant-at-arms. His action however failed. On the occasion of the Manchester riots in 1809 he wrote a letter to his constituents, for which he was tried for libel, found guilty, and condemned to three months' imprisonment, and to pay a fine of L.1000. In 1837, he ceased to represent Westminster, and when he was returned for North Wiltshire he joined the conservative party, which he supported during the remainder of his political career. He died on the 23d of January 1844.

BURDWAN, a province of Hindustan, presidency of Bengal. It is bounded on the north by the British district of Beerbhoom; on the N.E. and E. by that of Nuddea; on the south by Hooghly and Midnapore; and on the west by Bancoorah. It lies between Lat. 22. 52.—23. 40. Long. 87. 21.—88. 23., is 70 miles in length from N.E. to S.W., and 60 in breadth in the direction of the opposite angles, and contains an area of 2224 square miles. district is perhaps the best cultivated and most productive of any similar extent of territory in India; while it appears like a garden in a wilderness, being surrounded by the jungles of Midnapoor in Orissa, of Pachete, and of Beerbhoom. Its products are grain, cotton, silk, sugar, and indigo, which it yields in great abundance, and of excellent quality. One of the most important objects of manufacture is the refining of sugar. The population has been estimated at 1,854,152. Several rivers traverse the province or form its boundaries, among which are the Hooghly, the Hadjee, the Bhagruttee and the Damooda. It is also intersected by the great trunk line of railroad from Calcutta to Rajmahal on the Ganges; and also by a branch from the main line extending from the town of Burdwan to the collieries at Raneegunge. The tract comprised within the province was acquired by the East India Company, under treaty with Meer Cossim in 1760, and confirmed by Shah Alum, emperor of Delhi in 1765. Burdwan, the principal place of the district, containing a population of upwards of 50,000 inhabitants, is situate in Lat. 23. 12. Long. 87. 56.

BURFORD, a market-town and parish of the hundred of Bampton, in the county of Oxford, on the river Windrush, 76 miles from London. It is celebrated as the place where an ecclesiastical synod was held in 685, to determine the time for celebrating Easter; for a battle between Cuthred, king of the West Saxons, and Ethelbald, king of the Mercians; and for a victory by Fairfax in 1649 over the army of Charles I. The church is a large and handsome fabric, with a lofty spire. The houses are, with few exceptions, irregular and ill built. There is very little trade. Market-day Saturday. Population of parish in 1852, 1819.

BURG, a walled town of Prussian Saxony, the capital of the circle of Jerichow I., in the government of Magdeburg. It stands on the river Ihle, on the railway from Berlin to Magdeburg, 14 miles N.E. of the latter. It has long been noted for its woollen manufactures, which still afford employment to a great part of its population. It has also several dye-works, and tobacco and snuff manufactories. Pop. (1849) 14,673.

BURGAGE is a form of tenure, both in England and Scotland, applicable to the property connected with the old municipal corporations and their privileges. The term is of less practical importance in the English than in the Scottish system, where it still holds an important place in the practice of conveyancing, real property being there gene-

rally divided into feudal-holding and burgage-holding. It is Bürger. usual to speak of the English burgage-tenure as a relic of Saxon freedom resisting the shock of the Norman conquest and its feudalism, but it is perhaps more correct to consider it a local feature of that general exemption from feudality enjoyed by the municipia as a relic of their ancient Roman constitution. The reason for the system preserving its specifically distinct form in Scottish conveyancing, is because burgage-holding was an exception to the system of subinfeudation which remained prevalent in Scotland when it was suppressed in England. While other vassals might hold of a graduated hierarchy of overlords up to the crown, the burgess always held directly of the sovereign. It is curious that while in England the burgage-tenure was deemed a species of soccage to distinguish it from the military holdings, in Scotland it was strictly a military holding, by the service of watching and warding for the defence of the burgh. In England the franchises enjoyed by burgesses, freemen, and other consuetudinary constituencies in burghs, were dependent on the character of the burgage-tenure. (See MUNICIPAL CORPORATIONS.) (J. H. B.)

BURGER, GOTTFRIED AUGUSTUS, a celebrated German poet, born January 1, 1748, at Wolmerswende, a village in the principality of Halberstadt, where his father was Lutheran minister. In his childhood he discovered little inclination to study: the Bible and the Canticles alone had any attraction for him; and his first attempts in versification were imitations of the Psalms. It is to this first direction of his studies that we are to attribute the biblical phrases, and the allusions to Christianity, which we find even in his amatory poetry. He was fond of solitude, and indulged in all the romantic sentiments which deserts and the gloom of forests inspire. From the school of Aschersleben, where his maternal grandfather resided, and which he quitted in consequence of receiving a severe chastisement for composing an epigram, he was sent to the institution at Halle. But at neither of these places did he make much progress, having a taste only for the lessons in prosody and versification. In 1764 Bürger, who was intended for the clerical office, began to attend the course of lectures given by the professors of the university. Klotz, a learned classical scholar, admitted him into the select number of the young men whose talents he took a pleasure in cultivating; but this society appears not to have produced the same favourable effect onthe moral character of Bürger as on his genius. His conduct prejudiced his grandfather Bauer against him; and it was with difficulty that he obtained from him some further assistance, with permission, in the year 1768, to repair to Göttingen to prosecute the study of the law. This change did not make him more regular in his studies; his morals became corrupted; and his grandfather withdrew his protection. Bürger contracted debts; and his situation would have become altogether desperate had not some friends interfered to assist him. An association, memorable in the annals of German literature, and into which Bürger was now admitted, had just been formed at Göttingen: it reckoned among its members Boje, Biester, Sprengel, Hölty, Müller, Voss, the two Counts Stolberg, C. F. Cramer, and Leisewitz. All of these were persons versed in Greek and Roman literature, and, at the same time, they all idolized Shakspeare. Bürger, in a great measure, owed his style to the enthusiasm which he showed, in common with his literary friends, for our great dramatist. The Reliques of Ancient English Poetry, published about this time by Dr Percy, gave an additional impulse to the direction which his mind had taken, and suggested to him some of his most admired productions. Of all his friends, Boje was the one who exercised the greatest influence over him in the choice and treatment of his subjects; and it is to his severe observations that the poetical stanza of Bürger owes a great part of that elegance and roundness which characterize it. To Bürger. the same friend he was indebted also for some improvement in his circumstances. On the recommendation of Boje he was appointed to the collectorship of Alvengleichen, in the principality of Calenberg. The following winter, some fragments of a ghost story, which he heard a peasant girl singing by moonlight, caught his imagination, and suggested his celebrated ballad of *Leonora*. This remarkable production at once established his reputation as a poet. About this time he married a Hanoverian lady, named Leonhart; but this union proved only a source of bitterness, as an unhappy attachment to her younger sister soon after sprung up in his heart. The loss of a sum of money, of which his grandfather had made him a present, was the first commencement of his embarrassments; the taking of a large farm, which he did not know how to manage, increased them. The dismissal from his place, in 1784, in consequence of suspicions (probably ill-founded) raised against the fidelity of his accounts, gave the finishing stroke to his misfortunes. He had a little before lost his wife, whose death was hastened by the culpable passion which Bürger cherished in his heart. Left with two children, and reduced to the inconsiderable emoluments of The Almanack of the Muses, which he had edited since 1779, he removed to Göttingen, with a view to giving private lessons there, and in the hope of obtaining a professor's chair in the department of belles-lettres. Five years later the title was conferred on him, but without a salary; and this was the only public recompense obtained during his whole life by a man who was one of the favourite authors of his nation, and who, while yet young, had achieved the highest reputation. Scarcely were the ashes of his wife cold when he espoused her sister, whose name his poems have made but too famous. She died soon after in childbed in the beginning of 1786. From that moment his own life only lingered on; and the fire of his genius seemed extinguished with the passion which had so long nourished it. He had scarcely strength enough, in the intervals of his dejection, to finish his Song of Songs, a sort of dithyrambic or nuptial hymn, intended to celebrate his second marriage, and which is a strange mixture of frantic passion, religious devotion, and the most bombastic expression. It was the last production of Bürger. Having studied the philosophy of Kant, he had an idea of deriving some advantage from it at Göttingen, where it had not yet been taught. He undertook to explain it in a course of lectures, which were attended by a great number of students. The satisfaction which the university expressed to him for two cantatas which he composed in 1787, on the occasion of the fifty years' jubilee of this illustrious institution, and his appointment to the situation of professor extraordinary, reanimated his spirits. Fortune appearing to smile on him once more, he formed the design of marrying again. During one of the moments when he was most occupied with this idea, he received a letter from Stuttgard, in which a young woman, whose style indicated a cultivated mind, and her sentiments an elevated and feeling heart, after describing to him with enthusiasm the impression which his poetry had made upon her, offered him her hand and heart. The information which he received respecting the character, the fortune, and personal accomplishments of his correspondent having excited his curiosity, he took a journey to Stuttgard, and brought back with him a wife who embittered and dishonoured the rest of his days. In less than three years he saw himself under the necessity of obtaining a divorce from her; and the ruin of his health aggravated the absolute disorder of his finances. Confined to a small chamber, the favourite poet of Germany wasted the remainder of his strength in translations for foreign booksellers; but sickness and grief soon deprived him even of this resource, and he must have died in a state of the most abject poverty, if the government of Hanover had not relieved his necessities. He died on the 8th of June 1794.

Bürger is only remarkable as a lyric poet; for after hav- Burgersdiing tried all the different species of this class of compositions, he has succeeded eminently only in the song and the ballad. We shall perhaps characterize his genius sufficiently by saying that his imagination is more fresh than rich,that he has more sensibility than elevation, more naiveté and good nature than delicacy or taste. His style is striking from its clearness and its energy, and an elegance which is rather the result of labour than of natural grace; he possesses, in short, all the qualities which please the multitude. Allowing the title of poet only to those whose writings were calculated to become popular, he early habituated himself to reject whatever appeared to him not sufficiently intelligible and interesting to all classes of readers. He is always clear and forcible; and if at certain times there appears a want of selection and care in the details, yet the sentiments are uniformly noble, and the moral purpose of the majority of his pieces is irreproachable. Some breathe the loftiest piety and the purest love of virtue. Wieland said of him (German Mercury, 1778), that in composing his poem entitled Mannerheuschheit (on Chastity), Bürger had deserved better of the present and future generations than if he had written the finest treatise of morality. This little piece has been inserted in most of the collections

of hymns for the use of the Lutheran church.

Three editions of Bürger's works have been published at Göttingen. The first two appeared in 1778 and 1789, in 3 vols. 8vo; and the third, after his death, was published by his friend Ch. Reinhard, in 4 vols. 1796. We must confine ourselves to a short notice of those for which their merit or singularity has procured the greatest degree of celebrity. 1. A translation, or rather an imitation, of the Vigil of Venus (Pervigilium Veneris). 2. Leonora, a romance; which belongs to the class which Burger himself called the epic lyric. Leonora was translated into Danish in 1788, six times into English, by Stanley, Pye, Spencer, Taylor, &c., and from English into French by De la Madelaine in 1811. The translation by Mr Spencer is accompanied with engravings after designs by Lady Diana Beauclerc. Two German composers have set it to music. 3. The Minister's Daughter of Taubenhain is the story of the seduction and tragical end of a young girl. 4. The Inhuman Huntsman. 5. The Song of the Brave; in which the heroism of a peasant, who saves a family from the fury of the waves, is related with admirable feeling. 6. The Song of Songs, conceived at the foot of the altar. This is a hymn or ode in praise of his second wife. 7. A Travestie of the Fable of Jupiter and Europa. 8. A translation in iambic verse, of some books of the Iliad. 9. An excellent Translation of Shakspeare's Macbeth. 10. Pieces of Poetry and of Rhetorical Prose. He had begun to write critical observations on his own works; but he has only left some fragments of this work. 11. He was editor of the Gottingen Almanack of the Muses, from 1779 to 1794. Vetterlein, Politz, and Engel, have published a selection of the poetry of Bürger, with notes; and celebrated composers, such as Schulz and Reichhardt, have set a great number of his songs to music. Bürger's third wife, whose name German biography has thought worthy to be associated with her husband's, on account of her taste for literature and particularly poetry, is author of several pieces in verse inserted in the collection. The one having for its title The Raillery of a Mother, is sufficient to prove her poetical

BURGERSDICIUS, or Burgersdyk, Francis, a celebrated Dutch logician, was born at Lier near Delft, in 1590. He studied at the University of Leyden, and after completing his academical career with great distinction there, travelled through Germany and France. On arriving at Saumur in the latter country he began to study theology, and was so successful, that while still a very young man he was appointed professor of philosophy in that town. This office he held for five years, at the end of which period he returned to Leyden, where he accepted the chair of logic and moral philosophy, and afterwards that of natural philosophy. His system of logic was at one time universally received, and even yet has not fallen wholly into disuse. His treatise entitled *Idea Philosophiæ Moralis* issued from the Elzevir press in 1644. Burgersdyk died at Leyden in 1629, in the thirty-ninth year of his age.

BURGESS, a term generally applied to a person holding some of the privileges conferred by the old municipal Burggrave. corporations. It came into peculiar use in England as the term for the parliamentary representation of a burgh. See MUNICIPAL CORPORATIONS.

Burgess, Daniel, a learned and witty dissenting divine of the seventeenth century, born at Staines in Middlesex, of which parish his father was minister. He was educated at Westminster school, and in 1660 was sent to Magdalen Hall, Oxford, but not being able conscientiously to subscribe the necessary formulæ, he quitted that university without taking his degree. In 1667, after taking orders, he was appointed by Lord Orrery to the head-mastership of a school recently established by that nobleman at Charleville in Munster, and soon after became private chaplain to lady Mervin, near Dublin. On his return from Ireland, he openly avowed his Presbyterian principles, and frequently preached in contempt of the severe laws against nonconformity. For these offences he was imprisoned, but soon regaining his liberty, he went to London, where he speedily collected a large congregation, as much by the somewhat fanatical fervour of his piety as by the ludicrous illustrations which he frequently employed in his sermons. Besides preaching, he gave instructions to private pupils, of whom the most distinguished was Henry St John, afterwards Lord Bolingbroke. He died in 1712.

Burgess, Right Rev. Thomas, bishop of Salisbury, was born at Odiham, in Hampshire, in 1756. He was educated at Winchester, and in 1775 he removed to Oxford, where he gained a scholarship at Corpus Christi College. Before graduating, he edited a reprint of Burton's Pentalogia. In 1781 he brought out an edition of Dawe's Miscellanea Critica, with numerous annotations, a work so favourably received on the continent that it was reprinted verbatim at Leipzig in 1800. In 1783 he became a fellow of his college, and two years later undertook a journey to Holland, where he prosecuted his researches for some time. On his return he was appointed chaplain to Shute Barrington, bishop of Salisbury, through whose influence he obtained a prebendal stall in the cathedral of that town. In 1789 he published his Considerations on the Abolition of Slavery, in which he advocated the principle of gradual emancipa-tion. From Salisbury he removed to Durham, where he effected much good among the poorer classes, by publishing and distributing suitable religious works. In 1803, he was promoted by his old schoolfellow Addington, then prime minister, to the vacant see of St David's, which he held for twenty years, and where he gave evidence of his philan-thropic disposition by establishing the Society for the promotion of Christian Knowledge, and founding the college of Lampeter, which he liberally endowed. In 1820 he was appointed first president of the Royal Society of Literature recently founded; and three years later was promoted to the see of Salisbury, over which he presided for twelve years, prosecuting his benevolent designs with unwearied industry. Not the least important among the many services which he rendered to the church, was the establishment of a Church Union Society for the assistance of infirm and distressed clergymen, to which he bequeathed L.3000. In the midst of his useful and laborious career, he was cut off by an attack of dropsy, February 19, 1837. A list of his works, which are very numerous, will be found in his biography by J. S. Harford. In addition to those already referred to, may be mentioned his "Essay on the Study of Antiquities;" "The first Principles of Christian Knowledge;" "Reflections on the Controversial Writings of Dr Priestley;" "Emendationes in Suidam et Hesychium et alios Lexicographos Græcos;" " The Bible, and nothing but the Bible, the Religion of the Church

BURGGRAVE (burg town, and graf or grave count), the hereditary governor of a castle or fortified town, chiefly

in Germany. The burggraves were originally the same as Burghbote castellans or comites castellani; but their dignity was considerably advanced under Rodolph of Hapsburg, when they began to rank with princes.

BURGHBOTE, in Old Laws, signifies contribution towards the building or repairing of castles or walls, for the defence of a borough or city. By a law of King Athelstan, the castles and walls of towns were to be repaired, and burghbote levied every year. No person was exempt from this service, and even the king could not exempt a man from burghbote; yet in after-times exemptions appear to have been frequently granted, insomuch that the word burghbote came to denote, not the service, but the exemption

BURGHBRECH (burgh and break), a fine imposed on a burgh for a breach of the peace.

BURGHMOTE, the court of a borough. By the laws of King Edgar, the burghmote was held thrice a-year; by those of Henry I. twelve times.

BURGKMAIR, Hans or Joun, a very celebrated enraver on wood, and believed to have been a pupil of A. Dürer, was born at Augsburg in 1472. Some of his works are dated as early as 1510. Professor Christ ascribes to him about 700 woodcuts, most of them distinguished by that spirit and freedom that we admire in the works of his supposed master. His principal work is the series of 135 prints, representing the triumphs of the Emperor Maximilian I. They are of large size, executed in *chiar-oscuro*, from two blocks, and convey a high idea of his powers. Several other of his pieces are mentioned by Strutt. Burgkmair was also an excellent painter in fresco and in distemper, specimens of which are in the galleries of Munich and Vienna, carefully and solidly finished in the style of the old German school. He died about 1559.

BURGLARY, or Nocturnal House-Breaking (burgi latrocinium), which by the ancient English law was called hamesucken (a word also used in the law of Scotland, but in a somewhat different sense), has always been looked upon as a very heinous offence. The definition of a burglar, as given by Sir Edward Coke, is, "he that by night breaketh and entereth in a mansion-house with intent to commit a felony." The offence and its punishment are under the provisions of the 7th Will. IV., and 1st Vict., c. 86, which require the night to be reckoned from nine in the evening until six in the morning, and applies the punishment of death where the offence is accompanied by personal violence, long transportation (now liable to be commuted to penal servitude), or imprisonment, being the punishments for the more mitigated form of the offence.

BURGOMASTER, BURGHERMASTER, BURGERMESTER, or BURGMEISTER, the chief magistrate of the great towns in Flanders, Holland, and Germany.

BURGOMASTER. See ORNITHOLOGY, Index.

BURGONET (French bourguignotte), an ancient kind of helmet, with a small visor, and without a gorget. It was first used by the Burgundians, hence its name.

BURGOS, an ancient province of Spain in the kingdom of Old Castile, comprehending the modern provinces of Burgos, Logrono, and Santander, and covering an area of 7644 square miles. The modern province is bounded north by the province of Santander; east by Alava, Navarre, and Soria; west by Palencia and Valladolid; south by Segovia. The territory of Burgos is elevated and mountainous, being intersected by several sierras; the slopes of which, however, are well stocked with game, and afford pasture for large herds of black cattle, horses, mules, sheep, and goats. It abounds in spacious and well-watered valleys, in which wheat, barley, oats, maize, rye, flax, and hemp, are grown for home consumption. The cultivation of the vine is little attended to; but the facilities for rearing bees give rise to a considerable traffic in honey and wax. The climate of

Burgos. Burgos is cold, damp, and variable, and the province from its elevation is exposed to severe storms from the N. and N.E. Pop. (1849) 234,022.

Burgos, the capital of the above province, stands on the slope of a hill the base of which is skirted by the river Arlanzon, in Lat. 42. 21. N. Long. 3. 43. W. It is a considerable town, consisting of about 1400 houses, originally girt into the form of a segment of a circle by a wall, some portions of which still remain. On the opposite bank of the river, and connected with the more ancient part of the town by three stone bridges, are the suburbs (Barrio de la Vega), tastefully laid out in pleasure-grounds; whilst lower down in the midst of the stream is an island furnished with seats and walks as a public promenade. The streets and squares are exceedingly irregular, although spacious and well built. The principal square is the Plaza Mayor, or Plaza de la Constitucion, in the centre of which is a bronze statue of Charles II. The most important public building is the cathedral, begun in 1221, but not completed till 1567. It is built in an irregular florid Gothic style, and contains eight chapels, the most famous of which is the Capilla del Condestable, containing the tombs of several of the Velasco family, the hereditary constables of Castile. Besides the cathedral there is the Hotel de Ville, the Palace of Velasco, the church of St Paul, and a beautiful Doric arch erected in honour of Fernando Gonzalez. There is a fine approach to the city through the massive gate of Santa Maria, surmounted by a statue of the Virgin and Child, with figures of Fernando Gonzalez, Charles I., the Cid, and Diego Porcelos, in the niches. The hospitals of Burgos are seven in number, and well supported; they are the Hospital San Juan (founded in 1479), the Hospital de la Conception, San Julian, San Quirce, Del Rey, Militar, and the Hospicio y Casa de Epositos. The educational wants of the district are supplied by four primary schools, which are liberally endowed from the municipal funds, and afford gratuitous instruction to upwards of 200 pupils. There is also a normal school and a Seminario Conciliar, in which the higher branches are taught. But the most important educational establishment is the Instituto Superior Burgalez, which has a staff of 21 professors, and annually enrols about 250 students. The professors give prelections on language. science, and the fine arts. Burgos is the see of an archbishop, who has for his suffragans the bishops of Pamplona, Palencia, Santander, and Tudela. It has several monasteries, amongst which may be mentioned the Monasterio de Fredesval, San Agustin, &c. About two miles distant from the town stands the Carthusian Convent, de Miraflores, built as a royal burying-place; whilst a little below the promenade of the Isla stands the Real Monasterio de las Huelgas, founded by Alonzo VIII., the abbess of which was invested with almost royal prerogatives, and held unlimited sway over more than 50 villages. Burgos is the official residence of a military staff, and is well provided with barracks and storehouses. The jurisdiction of its courts extends over the whole audienza, including Alava, Guipuscoa, Logrono, Santander, Soria, and Vizcaya.

Besides furnishing a mart for the agricultural produce of the neighbouring districts, it carries on a considerable export trade in linen and woollen stuffs, made in imitation of English goods. The principal articles of manufacture are hats, stockings, and leather goods. Recently a paper-mill has been started, which gives employment to 120 operatives

of both sexes. Pop. (1845) 14,790.

The history of Burgos cannot be carried back beyond the end of the ninth century. There is no trace of its existence during the occupation of Spain by the Romans. We find the nucleus of it existing in 884, when Diego Porcelos, at the command of Alfonso the Great, built a castle on the right bank of the Arlanzon to check the progress of the Moors. From that time forward we find it steadily increasing in importance, reaching the height of its prosperity

in the fifteenth century, when alternately with Toledo it was Burgunoccupied as a royal residence, but rapidly declining when the court was finally removed to Madrid. Being on one of the principal military roads of the kingdom, it suffered severely in the Peninsular War. It was unsuccessfully besieged by Wellington in 1812, but was surrendered to him in the opening of the campaign of the following year.

BURGUNDIONES, Bourgoundiones, Burgundii, a powerful race of Vandals or Goths, whose original territory lay between the Oder and the Vistula. Some of the ancient writers, however, state that they were descendants of the Roman garrisons who had been left in Germany by Drusus and Tiberius. They were driven out of their territory by the Gepidæ, and gradually proceeded westward till they settled in Gaul, where they organized the powerful princi-

pality of Burgundy.

BURGUNDIUS, or Bourgoigne, Nicholas, an eminent jurist, born in 1586 at Enghien in Hainault. In 1627 he was appointed professor of civil law at Ingoldstadt, and honoured with the dignity of Count Palatine. He studied with great care the manners and customs of the feudal times; and on this subject he is still consulted as one of the best authorities. A collective edition of his works appeared at Brussels in 1674. The best of these, the Historia Belgica ab anno 1558 ad annum 1567, is a detailed history of the Low countries for the nine years preceding the arrival of the Duke of Alva.

BURGUNDY, called also Burgundy Proper, or Lower Burgundy, formerly a province in the east of France, lying on the west of Franche-Comté, and on the south of Champagne. It now forms the departments of Côte d'Or, and Saône et Loire, with part of those of Aube, Yonne, and Upper Marne, under which several heads Burgundy will be found

BURHAMPOOR, a town of Hindustan, in the province of Bengal, situated on the east bank of the Bhagirathi or Cossimbazar river, five miles south from Moorshedabad. It is one of the military stations of the British government; and the cantonments, consisting of a grand square inclosing a fine parade-ground, command the notice of the traveller. Formerly the place proved unhealthy to the European constitution, and the extent of mortality which prevailed was painfully brought to view by the crowded state of the European burial-ground. At present, however, owing to the introduction of sanitary measures, the cantonment is represented to be inferior to none in Bengal for its salubrity. An air of grandeur and importance is communicated to the place by a number of stately buildings scattered over the neighbourhood. A government college is about to be established in the town. Lat. 24. 5. Long. 88. 17.

BURHILL, or BURGHILL, Robert, a learned historian and divine, born at Dymock in Gloucestershire in 1572. At the age of fifteen he entered Corpus Christi College, Oxford, of which he afterwards became a fellow. Shortly after taking orders, he received the living of Northwold in Norfolk, where he ultimately died in 1641, just before the outbreak of the civil war. His learning and judgment were deemed worthy of especial notice by the author of the Athence Oxoniensis; and were highly appreciated by Sir Walter Raleigh, who derived much assistance from Burhill, when engaged upon his History of the World, during his confinement in the Tower.

BURIAL, the interment of a deceased person. In almost all countries the rites of sepulture have been looked upon as a debt so sacred, that those who neglected to discharge them were thought infamous. Hence the Romans called them justa, and the Greeks νόμιμα, δίκαια, ὅσια, words implying the inviolable obligation which nature has laid upon the living to perform the obsequies of the dead. The Romans in the most ancient times appear to have buried their dead; but the practice of burning the body was early

diones Burial.

Burke.

Buridan.

Buriats adopted, and both burning and burying continued to be practised more or less until the introduction of Christianity. It is not surprising that the ancient Greeks and Romans were extremely solicitous about the interment of their deceased friends, since they believed that their souls could not be admitted into the Elysian fields till their obsequies had been performed; and that if they did not obtain the rites of burial they were excluded from the happy mansions for the term of a hundred years. For this reason it was considered as a duty incumbent upon all travellers who happened to meet with a dead body in their way, to cast dust or mould upon it three times; and of these, one portion at least was cast upon the head. (Horace, Ode 28, Book I.) The ancients likewise considered it as a great misfortune if they were not laid in the sepulchres of their fathers; for which reason the ashes of those who died in foreign countries were usually brought home and interred with those of their ancestors. But notwithstanding the great care in the burial of the dead, there were some persons whom they thought unworthy of the last office, and to whom therefore they refused it; namely, public or private enemies; such as betrayed or conspired against their country; tyrants, who were always looked upon as enemies to their country; villains guilty of sacrilege; such as died in debt, whose bodies belonged to their creditors; and offenders who had suffered capital punishment.

Of those who were allowed the rites of burial, some were distinguished by particular circumstances attending their interment. Thus persons killed by lightning were buried on the spot where they fell, which was ever after considered sacred. (See BIDENTAL.) Those who wasted their patrimony forfeited the right of being buried in the sepulchres of their fathers; and those who were guilty of self-murder were privately consigned to the earth without the accus-

tomed solemnities.

Among the Jews the privilege of burial was denied only to self-murderers, who were thrown out to rot upon the ground. In the Christian church, though good men always desired the privilege of interment, yet they were not, like the heathens, so concerned for their bodies as to think it any detriment to them if either the barbarity of an enemy or some other accident deprived them of this privilege. The primitive Christian church denied the more solemn rites of burial only to the unbaptized, to self-murderers, and to excommunicated persons who continued obstinate and impenitent in contempt of the censures of the church. See BURYING-PLACE; FUNERAL RITES.

BURIATS, BURATY, or BRATSKY, a tribe of Tartars, now brought under the jurisdiction of Russia, and widely dispersed throughout Siberia, in the government of Irkutsk, wherein their numbers are computed from the capitation tax at about 300,000. Their features are of a genuine Tartar cast, resembling those of the Kalmucks, though they are not quite so flat, the nose being somewhat higher, and the countenance more open. They themselves trace their origin to the Kalmucks, and not to the Moguls. They are pastoral in their habits, and depend for their subsistence chiefly on their flocks, but some of their number devote themselves to agriculture. The principal occupations of the men are riding and hunting; and they are dexterous archers as well as skilful horsemen. They have likewise made considerable progress in the working of iron, and in tanning. Many women of the tribe are occupied in this latter branch of industry, and display much ingenuity and taste in the art. They are esteemed honest and sincere, and both sexes are extremely courteous. They are very ignorant, and debased by the grossest paganism. The residence of this tribe is chiefly around the shores of the lake Baikal, and the rivers Angora and Lena.

BURIDAN, JEAN, a native of Bethune, in Artois, and one of the most celebrated philosophers of the fourteenth

century, flourished between 1338 and 1358. He taught Burigny in the university of Paris with great reputation, and wrote on logic, ethics, and Aristotle's metaphysics. Aventinus relates that he was a disciple of Ockam; and that, being expelled Paris by the intrigues of the realists, who were at that time more influential than the nominalists, he went into Germany, where he founded the university of Vienna; but that writer is clearly in error in attributing to Buridan the founding of this institution. Buridan was the author of the well-known illustration of the doctrine of free-will by the proverb of the ass between two bundles of hay—a sophism that long perplexed the schools.

BURIGNY, JEAN LEVESQUE DE, a learned French writer, was born at Rheims in 1691. In 1713 he went to Paris, and with two elder brothers pursued a systematic course of study extending over almost every department of human knowledge. The result of these labours was embodied in an Encyclopædia in twelve folio volumes, to which Jean contributed about one-half. In 1756 he was elected into the French academy, and in 1785 was rewarded with a pension by the king. His largest work, The Lives of the Popes, is not much esteemed now as an authority; but his biographies of Erasmus, Grotius, and Bossuet, are interesting and valuable. He died at Paris in 1785, aged ninety-

BURIN (French burin), a graver; an instrument of tempered steel, for engraving on copper. It is of a prismatic form, and the end is ground off obliquely so as to produce a sharp point. The expressions soft-burin, brilliant-burin, are used to characterize the manner of the

BURKE, EDMUND, an illustrious writer, orator, and statesman, was born in Dublin on the 1st of January 1730. His father was an attorney, first in Limerick, and afterwards in Dublin. Young Burke received the rudiments of his education at Castletown Roche. He was afterwards put under the tuition of Abraham Shackleton, a Quaker of some celebrity at Ballitore, in the county of Kildare. Committed to the care of a master so well qualified for the business of instruction, he applied to his studies with commendable assiduity, and in this seminary laid the foundation of his knowledge of the ancient languages, and probably also imbibed that love of liberty which so often pointed his oratory, inflamed his passions, animated his sentiments, and in his best days secured him an almost unequalled reputation.

Here several years of his life were spent; and the attachment of the master and the gratitude of the pupil reflect equal honour on both. The former lived to see his scholar attain a considerable degree of reputation; and the latter, on his part, was accustomed to spend a portion of his annual visit to Ireland at Ballitore. He also kept up an epistolary correspondence with him, which lasted till the death of his

tutor.

From this provincial seminary Edmund was sent to the university of Dublin. But here he does not appear to have distinguished himself much either by application or talents: his character as a student was merely negative. He received a degree, however, before he departed, and during this period he commenced author, by writing some political essays.

Mr Burke now addicted himself to other pursuits, particularly logic and metaphysics, and is said to have planned a refutation of the systems of Berkeley and Hume. But whilst thus employed in treasuring up the means of attaining a species of celebrity which far different avocations prevented his afterwards aspiring to, he was not inattentive to the grand object of obtaining a suitable settlement in life. His family was not opulent, and as he already panted after independence, he repaired to the metropolis, and enrolled his name as a student of the Inner Temple.

Burke.

It appears from his speeches, his writings, and his conversation, that he studied the outlines of our municipal jurisprudence with attention; but it may be doubted whether he ever entered deeply into the study of law. The versatility of his talents and his avocations were, indeed, but little calculated for that dull and plodding perseverance which can alone lead to an intimate knowledge of our laws; and even if he had been gifted with the necessary application, both time and opportunity were wanting; for it is well known that at this period of his life the res angusta domi did not permit the student to dedicate his attention solely to this, or indeed to any other single pursuit. The exhausted state of his finances called frequently for a speedy supply; and, instead of perusing the pages of Bracton, Fleta, Littleton, and Coke, he was obliged to write essays, letters, and paragraphs, for the periodical publications of the day. But if these pursuits diverted his attention from graver studies, they acquired him a facility of composition, and a command of style and of lancourse of his future life. About this period he became a candidate for a vacant chair in the university of Glasgow, but he was unsuccessful.

His health, however, became at length impaired, and a nervous fever ensued. This circumstance induced him to call in the aid of Dr Nugent, a countryman of his own, and a man of amiable manners, though not of extensive practice. This gentleman, who was himself an author, readily discovered the source of Mr Burke's malady, and, by removing him from books and business to his own house, soon effected a cure; an event which is said to have been hastened, if not entirely completed, by a physician of another kind, the accomplished daughter of Dr Nugent, whose delicate attentions to the invalid appear to have made a deep impression on his heart. In fact this lady afterwards became Mrs Burke; and the circumstance was particularly fortunate for him, as her disposition was mild and gentle, and she continued throughout a long series of years, and many vicissitudes of fortune, to soothe and tranquillize passions always violent, and often tumultuous.

After some time ostensibly spent in the study of law, Mr Burke seems to have determined once more to endeavour to distinguish himself as an author; and accordingly he took advantage of the death of a celebrated nobleman to compose a work after the manner of that distinguished writer, so that, by exaggerating his principles, he might be enabled to bring them into contempt; but this effort proved unsuccessful, and the treatise in question was for a long time consigned to oblivion, nor would it have ever been heard of, had it not been resuscitated by his future fame. But the success of another performance made ample amends for this disappointment. His Essay on the Sublime and Beautiful attracted a great degree of notice, and acquired him considerable celebrity as a man of letsaid to have received a present of a hundred pounds from his father; but his circumstances must have been greatly embarrassed about this time, as he was obliged to sell his books,-a measure which nothing but the extremity of distress could have forced a man of letters to resort to.

This work having an immediate relation to taste, excited a desire in Sir Joshua Reynolds, even then at the head of his profession, to become acquainted with Mr Burke; and a friendship ensued which continued uninterrupted during the life of the painter, and was unequivocally testified by a handsome bequest in his will. Dr now became the constant frequenter of two clubs, composed of some of the most celebrated men of that day.

Street, and consisted of Dr Johnson, Mr (afterwards Sir Burke. Joshua) Reynolds, Dr Goldsmith, Mr Topham Beauclerc. Dr Nugent, Sir John Hawkins, Mr Bennet Langton, Mr Chamier, Mr Garrick, and Mr Burke. The other assembled at the St James's Coffee-house, and, besides many of the above, included Mr Cumberland, Dr Douglas, bishop of Salisbury, Dr Bernard, dean of Derry, Mr Richard Burke, Mr William Burke, Mr Hickey, and others. Dr Goldsmith, who was Mr Burke's contemporary at Dublin College, was member of both, and wrote the epitaphs of those who composed the latter.

A literary work on a new plan, first suggested in 1750, and by some attributed to the Dodsleys, but by others to Mr Burke, became for some time a considerable source of emolument to him. This was called the Annual Register, a publication which soon obtained considerable celebrity, and of which he had for several years the superintendence.

But Mr Burke was at length called off from his literary guage, which proved eminently serviceable to him in the pursuits by avocations of a far different kind. A gentleman who afterwards obtained the name of Singlespeech Hamilton, having been appointed secretary to the lord-lieutenant of Ireland, invited his friend Mr Burke to accompany him thither, an offer which he readily accepted; and although he acted in no public station, and performed no public service, while he remained in that country, he was rewarded with a pension of three hundred pounds per annum, which the conduct of Mr Hamilton soon afterwards compelled him to throw up.

On his return to England he amused himself, as usual, with literary composition; and a series of essays written by him in a newspaper, which at the time enjoyed great celebrity, attracted the notice of the Marquis of Rockingham; in consequence of which Mr Fitzherbert, father of Lord St Helen's, introduced him to that nobleman. From this moment he became a public man, and dedicated his studies, his eloquence, and his pen, almost exclusively to politics. Meanwhile Lord Rockingham, having proved more compliant than the Earl of Chatham, came into power; and when seated on the treasury bench, he selected Mr Burke as his private secretary,—an office of no power, and very little emolument, but one which naturally leads to both. As it was now necessary that he should have a seat in parliament, although it can scarcely be supposed that he was legally qualified in point of property, he applied to Lord Verney, patron of Wendover, and was returned for that borough, which was then dependent on his lordship, being principally occupied by his tenants.

Having thus obtained a seat in 1765, he prepared to qualify himself for his new situation. He had all the necessary talents, and was only deficient in knowledge of the forms of business, and in facility of expressing his sentiments before a public audience. The first of these he mastered by sedulous attention; and as to the second, In addition to the profits of the publication, he is if we are to credit those who were intimately acquainted with him at this period of his life, he overcame all difficulties by a previous initiation elsewhere. In short, he had acquired celebrity at the Robinhood before he attempted to speak in the British senate, and vanquished an eloquent baker ere he began to cope with the greatest orators this nation has ever produced.

Holding a confidential place under the Rockingham administration, he of course supported all its measures. A former ministry, anxious to increase its influence by means of increased imposts, had conceived the idea of taxing America through the medium of a parliament in which Johnson also sought and obtained his friendship; and he she was not represented, and attempted to carry this into effect by means of the famous stamp act; but the Americans, alarmed at what they conceived to be a flagrant vio-One of these met at the Turk's Head Tavern in Gerrard lation of every principle of the English constitution, made

the repeal. Under the pretext, however, of vindicating the honour of the crown, they unfortunately proposed and carried the declaratory act, by means of which, although the original scheme was abandoned, the principle on which it had been built was asserted anew, and a foundation laid for all the miseries which afterwards ensued. But if the Rockingham administration deserved no great credit on this occasion, it is entitled to considerable praise on account of other parts of its conduct; for it repealed the cider act, procured a declaration of the House of Commons condemning the seizure of papers, and carried a resolution against general warrants. On retiring from office, however, they did not carry much popularity along with them; Lord Chatham and his friends, who in some measure monopolized the public favour, were intrusted with the management of affairs for a short time; and it is exhad not America been driven into open resistance.

It now fell to the lot of Lord North to enforce the scheme which the Grenville party had projected, which the Rockingham administration had by an unaccountable blunder at once recognised and annihilated, and which they afterwards manfully and at length successfully opposed. This forms the most brilliant epoch of Mr Burke's life. He was hostile to the expulsion of Mr Wilkes, an act which the House of Commons afterwards rescinded from its records. On the application of the dissenters for relief, he espoused their cause, and expressed his resentment in very animated terms against that misguided policy which permitted all those not within the pale of the establishment to enjoy liberty less by right than by connivance. But perhaps the noblest part of his conduct consisted in his steady and uniform opposition to the American war, and his marked hostility to the abettors of the struggle. His speech against the Boston Port Bill was one of the most brilliant specimens of oratory that had ever been displayed in the British senate; and on the 19th of April 1774, on a motion for the repeal of the tea duty, he discovered such talents, that an old and respectable member exclaimed, "Good God, what a man is this! How could he acquire such transcendent powers?" And when, in reply to another who had said that the Americans were our children, and it was horrible to revolt against their parent, the orator uttered the following passage, the whole but when children ask for bread, we are not to give them a stone. When those children of ours wish to assimilate with their parent, and to respect the beauteous countenance of British liberty, are we to turn to them the shameful parts of our constitution? Are we to give them our weakness for their strength; our opprobrium for their glory; and the slough of slavery, which we are not able to work off, to serve them for their freedom?'

The city of Bristol, the merchants of which had become rich by the commerce with America, were likely to suffer by its interdiction. This consideration alone rendered many of them hostile to the proceedings of the ministry; but nobler and more exalted motives actuated the bosoms of some, particularly the quakers, dissenters, and other sectaries, who were moved by zeal against oppression, and a love of liberty imprinted on their minds by a constitution which until then had remained inviolate. Gratified by the exertions of Mr Burke in behalf of civil and religious freedom, they put him in nomination for the city, and sent into Yorkshire to request his immediate personal attendance. After consulting with his patron concerning an offer so flattering and unexpected, accompanied at

Burke. such a spirited resistance to the measure, that it was aban- that he should be put to no expense whatever, he im- Burke. doned, and the Rockingham party readily consented to mediately set out for the west of England, and found that no less than three candidates had started before him. The first was Lord Clare, afterwards Lord Nugent, one of the former representatives, whose unpopularity was such that he soon discovered the necessity of resigning all his pretensions; and of the two others, Mr Cruger and Mr Brickdale, who remained in the field, the former, like Mr Burke himself, was averse to a rupture with America.

The new candidate did not appear on the hustings until the afternoon of the sixth day's poll, on which occasion he addressed the electors in a very able speech, admirably calculated for the occasion; expressing a modest diffidence of his own abilities, and a high opinion of the important trust they were assembled to confer; boldly declaring himself hostile to a contest with America; and asserting that England had been rendered flourishing by liberty and commerce, the first of which was dear to his heart, whilst the tremely probable that they would have sunk into neglect latter had been a favourite object of his studies, both in its principles and details. This harangue was well received by the electors; the contest proved propitious to his wishes; and when the sheriffs had notified, at the close of the poll, that he was elected, he delivered the most brilliant address on the occasion that had ever been heard

within the walls of the city.

Mr Burke returned from his new constituents to parliament with increased vigour, reputation, and zeal. The Earl of Chatham, notwithstanding his reputation for wisdom, having failed in an attempt to adjust the troubles of the colonies by means of a conciliatory bill introduced by him into the House of Peers for that purpose, the obstinacy of the ministry now became apparent to every one. But this circumstance, which would have appalled an inferior man, did not, however, discourage the member for Bristol from making a similar attempt in another place; and accordingly, on the 22d March 1775, he brought forward his celebrated thirteen propositions, which were intended to close the fatal breach, and heal all the differences between the mother country and her colonies. His plan, on this occasion, embraced not only immediate conciliation, by a repeal of the late coercive acts, but also the creation of an independent judicature, and the regulation of the courts of admiralty. The whole, however, was quashed by a large majority on the side of the minister who moved the previous question.

Mr Burke had hitherto chiefly distinguished himself in house was electrified: "They are our children, it is true; opposition to the measures of others; but in 1780 he himself stood forth as the original author of a scheme which soon engaged the attention of the public, and actually appeared big with the most important results. When he found ministers obstinately persisting in a disastrous war, and perceived that the people began to bend beneath the weight of the taxes for its support, it struck him as at once advantageous and politically expedient to attempt to diminish the public burdens and the number of adherents of the court. Accordingly, on the 11th of February, he brought in a bill for the regulation of his majesty's civil establishments, and of certain public offices; for the limitation of pensions, and the suppression of sundry useless, expensive, and inconvenient places; and for applying the monies saved thereby to the public service. This scheme was manifestly founded on the late reforms which had taken place in France; for, by an edict of the king, registered in the parliament of Paris, it appeared that he had suppressed no less than four hundred places in his household by one regulation. The orator judiciously adverted to this event, and endeavoured to make use of it as an incitement to a similar attempt here, calling in national rivalship by way of an inducement to consent to this sacrifice the same time with assurances most punctually fulfilled, on the part of the crown. To this bill the minority did

it was at length carried, it was much modified and altered.

Parliament was dissolved in 1780, but Mr Burke was not re-elected for Bristol. This is said to have made a deep impression on the mind of the orator; but it must have been obliterated by the important events which speedily ensued; for the minister now tottered on the treasury bench, being abandoned by many of his staunchest supporters, and but little confident in his own schemes, all of which had proved eminently unsuccessful. Meanwhile the opposition having increased to a considerable degree, unceasingly assailed him, until at length, on the 28th March 1782, Lord North assured the House of Commons that his administration was at an end.

The day had now arrived when the ministry and opposition were to change places, and Mr Burke, whose services had been so conspicuous, was made a privy counsellor, and invested with the lucrative appointment of paymaster-general of the forces. He was thus at length enabled to enforce his plan of political economy, tendered before in vain; and the board of trade, the board of works, the offices of third secretary of state, treasurer of the chamber, cofferer of the household, the lords of police in Scotland, the master of the harriers, the master of the stag-hounds, the six clerks of the board of green cloth, and the paymaster of the pensions, were abolished. But when the reins of government were confided to the hands of the Marquis of Lansdown, then Earl Shelburne, this event gave such offence to those who wished to place the Duke of Portland at the head of affairs, that Mr Fox, Lord John Cavendish, and Mr Burke, immediately resigned.

In the mean time the critical state of the English East India Company had long agitated the public mind, and become occasionally a subject of discussion in parliament. The seizure, imprisonment, and confinement of Lord Pigot, by a faction in the council of Madras—the conduct of Mr Hastings in respect to several of the native powers—and the grand question of sovereignty, relative to the territorial possessions of the Company in Asia—had all at different times excited the attention of the nation. Accordingly, when Mr Fox and his friends came into power, he brought in a bill to remedy the various abuses in the government of British India. Of this bill Mr Burke is well known to have been in a great measure the author; and when it was introduced into parliament, he defended its principles and provisions with all the zeal of a parent. Notwithstanding much opposition both within and without, this celebrated bill was carried triumphantly through the House of Commons; but in the House of Peers it experienced a far different fate, and with it fell the power and consequence of its authors, framers, and supporters.

In the course of the next year, 28th February 1785, he made a splendid speech relative to the nabob of Arcot's debts; and depicted one of his creditors, who had taken an active share in the late elections, "as a criminal who long since ought to have fattened the region kites with his offal; the old betrayer, insulter, oppressor, and scourge of a country (Tanjore), which had for years been an object of an unremitted, but unhappily an unequal struggle, between the bounties of Providence to renovate, and the wickedness of mankind to destroy." But there appeared to Mr Burke to be a still greater delinquent; and accordingly he resolved to sacrifice, if possible, the powerful offender himself at the shrine of national vengeance. This was Mr Hastings; and, soon after his arrival in England, the orator gave notice of his intentions. On the 17th of February 1785 he opened the accusation by a most elo-

Burke. not at first give much opposition; and indeed the mover quent speech, in which he depicted the alleged crimes of Burke. of it contrived to soften those features which appeared the ex-governor-general in the most glowing and animated harsh to them. But notwithstanding this, it did not prove colours. This trial, however, turned out in the event very successful during Lord North's administration; and when different from what had been expected; whilst the length of it failed not to involve both Mr Burke himself and his party in reproach.

During the debate on the commercial treaty with France, 23d January 1787, Mr Burke, then member for Malton, exhibited an undiminished versatility of talents, and pointed his ridicule with no common success at Mr Pitt, who, according to him, contemplated the subject with a narrowness peculiar to limited minds:—" He seems to consider it," said he, " as an affair of two little counting-houses, and not of two great nations. He seems to consider it as a contention between the sign of the fleur-de-lis and the sign of the old red lion, for which should obtain the best custom."

The next public event of importance in which we find Mr Burke engaged, occurred in consequence of his majesty's indisposition. On this occasion he took an active part in the debates of the House of Commons, and is supposed to have penned a letter for one, and a speech for another branch of the royal family. When Mr Pitt moved his declaratory resolutions relative to the provisional exercise of the royal authority, Mr Burke attacked him with much asperity of language, and was particularly severe on the manner in which the royal assent was to be given to all future acts of parliament. The men who held most of the high places under the government were treated as jobbers, old hacks of the court, and the supporters and betrayers of all parties; and he declared that it was a mock crown, a tinsel robe, and a sceptre from the theatre, lackered over and unreal, which were about to be conferred on the prince of Wales.

The opposition, diminished indeed by a few occasional desertions, had hitherto acted as a great public body, supposed to be united in general principles for the common welfare and prosperity of the state; but the French revolution thinned their ranks, dispelled their consequence, and, by sowing jealousy between the chiefs, spread consternation and dismay among their followers. It was on the 2d of March 1790, when Mr Fox moved for leave to bring in a bill to repeal the corporation and test acts, that this disunion became evident; and soon afterwards Mr Burke declared that his honourable friend and he were separated in their politics for ever.

The ministry now seemed anxious to provide for their new associate; and he, on his part, certainly appeared deserving of some remuneration at their hands, for he had abandoned all his old friends, and not a few of his old principles. In addition to this, his Reflections on the Revolution in France had afforded some degree of countenance, and even popularity, to the measures of administration; and, not content with his own exertions, he had enlisted his son on the same side, and even sent him to Coblentz. The royal munificence at length gratified his warmest wishes; for by a warrant, dated 24th September 1795, he received a pension, made to commence from the 5th January 1793, of L.1200 for his own life and that of his wife, on the civil list; whilst two other pensions of L.2500 a year for three lives, payable out of the four and a half per cent. fund, dated 24th October 1795, were made to commence from the 24th July 1793. Honours as well as wealth now seemed to await him, for he was about to be ennobled, when the untimely death of an only child put an end to his dreams of ambition, and contributed not a little to hasten his own, which occurred at his house at Beaconsfield on the 9th of July 1797.

Thus died, in the sixty-eighth year of his age, Edmund Burke, one of the greatest orators, statesmen, and athors

Burkitt of his age; a man whose name will long continue to be celebrated; and one who, had he fallen during the meridian of his fame and character, would have scarcely been considered as second to any man, either of ancient or modern

BURKITT, WILLIAM, a celebrated commentator on the New Testament, was born at Hitcham in Suffolk, July 25, 1650, and educated at Pembroke Hall, Cambridge. He was ordained by Bishop Reynolds; and his first clerical employment was at Milden in Suffolk, where he continued twenty-one years, first as curate, and afterwards as rector. In 1692 he was presented to the vicarage of Dedham in Essex, and there he resided to the time of his death, which happened in October 1703. Besides a Commentary on the New Testament, he wrote a volume entitled The Poor Man's Help and the Rich Man's Guide.

BURLÉIGH. See CECIL.

BURLESQUE, a species of composition, which, though a great engine of ridicule, is not confined to the ridiculous alone; for it is distinguishable into burlesque that excites laughter merely, and burlesque that excites derision or ridicule. A grave subject, in which there is no impropriety, may be brought down by a certain colouring so as to be ridiculous, as in Virgil Travestie; the author laughing at every turn in order to make his readers also laugh. The Lutrin is a burlesque poem of the other sort, laying hold of a low and trifling incident in order to expose the luxury, indolence, and contentious spirit of a set of monks. Boileau, the author, turns the subject into ridicule by dressing it in the heroic style, and affecting to consider it as of the utmost dignity and importance. Though broad ridicule is the poet's aim, he always carries a grave face, and never once betrays a smile. It is the opposition between the subject and the manner of handling that produces the ridicule; and therefore, in a composition of this kind, no image professedly ludicrous ought to be admitted, because such images destroy the contrast.

Though the burlesque that aims at ridicule produces its effects by elevating the style far above the subject, yet the

poet ought to confine himself to such images as are lively Burlington and readily apprehended. A strained elevation, soaring above the ordinary reach of fancy, makes not a pleasant impression. The mind is soon disgusted by being kept long on the stretch. Machinery may be employed in a burlesque poem, such as the Lutrin, Dispensary, or Hudibras, with more success and propriety than in any other species of poetry; for burlesque poems, though they assume the air of history, give entertainment chiefly by their pleasant and ludicrous pictures. It is not the aim of such compositions to raise sympathy, for which reason a strict imitation of nature is not necessary; and hence the more extravagant the machinery in a ludicrous poem the more entertainment it affords.

BURLINGTON. See Bridlington.

В

BURLINGTON, a city and port, capital of the county of Chittenden, in the state of Vermont, North America, is pleasantly situated on the east side of Lake Champlain, 31 miles W.N.W. of Montpelier. The town is regularly laid out, and contains many elegant houses, generally surrounded by gardens. The scenery in the vicinity is magnificent. Besides the Vermont University (a well-endowed institution, with a medical school and a library of 13,000 vols.), it has a court-house, county buildings, banks, &c. The harbour is protected on the west by a breakwater. In 1849-50, there were 342 vessels of 82,856 tons cleared, and 404 vessels of 99,435 tons entered, in the foreign trade. Burlington is connected by railways with Canada and the western states. Pop. 7505.

BURLINGTON, a city and port of entry, capital of the county of the same name in the state of New Jersey, on the east side of the Delaware, 16 miles N.E. of Philadelphia. It has a city-hall, lyceum, library, and many elegant houses. Pop. 5398. Registered shipping (1850) 7578 tons.

BURLINGTON, the capital of the Des Moines county, in the state of Iowa, North America, stands on the west bank of the Mississippi, 62 miles S.S.E. of Iowa city. It was laid out in 1833, and in 1850 had a population of 5129. It is the largest city in the state, and has a considerable trade.

## BURMAH.

A COUNTRY situated in the S.E. of Asia, in the region beyond the river Brahmapootra. It is possessed by the Burmese, the limits of whose dominions have been greatly contracted by British conquests. On the west, where it is conterminous with the British territories in India, Burmah is bounded by the province of Arracan, surrendered to the British by the treaty concluded with the Burmese in 1826, and by the petty states of Tipperah, Munnepore, and Assam, from which countries it is separated by lofty ridges of mountains; on the south by the newly acquired British province of Pegu; on the north by Assam and Thibet; and on the east by China. Its limits extend from Lat. 19. 25. to 28. 15.; and from Long. 93. 2. to 100. 40.; comprising a territory measuring 540 miles in length from north to south, and 420 in breadth, with an area of 96,000 square miles.

That portion of Asia in which Burmah is situated slopes from the central mountains towards the south; and as it approaches the Indian Ocean, it subsides into an extensive champaign country, which is overflowed in the rainy season by the swelling of the rivers. The Burmese territory is watered by three great streams, namely, the Irrawaddy, the Saluem, and the Kyen-dwen, a tributary of the Irrawaddy. These rivers have their sources in the northern chain of mountains in the interior, some of which are covered with perpetual snow; and they run in a southerly course to the Indian Ocean. The Irrawaddy and the Sa-

luem are large rivers, which overflow the flat country on

their banks during the season of the rains. Burmah, having been despoiled of Pegu, contains neither maritime districts nor alluvial plains, but is altogether an upland territory, bounded at its southern extremity by a frontier line at the distance of about 200 miles from the mouths of the Irrawaddy. From this point the country begins to rise, and thence for about 300 miles farther it may be considered hilly and elevated: beyond this it is wild and mountainous. To the W. and N.W. it is divided from Arracan, Munnepore, and Assam, by mountainous ridges often of great elevation.

Though inferior in point of fertility to the low-lying tracts Natural of which Burmah has been stripped, the upland country is far producfrom being unproductive. The chief crops are rice, maize, tions. millet, wheat, various pulses, palms, the sugar-cane, tobacco, cotton, and indigo. The sugar-cane appears to have been long known to the Burmese; but though the climate and soil are extremely favourable, it is not generally cultivated, and the art of manufacturing sugar is scarcely known. A cheap and coarse sugar is obtained from the juice of the Palmyra palm, which abounds in the tract south of the capital, where numerous groves of this tree are to be seen. The cocoa and areca palms are not common. The tea plant is cultivated in the hills by some of the mountain tribes at the distance of about five days' journey, and by others in still greater perfection at the distance of about ten days' journey, from Ava. The leaves are elliptical, oblong, and serrated, and there is little

Aspect of the country.

Burmah. doubt of its being the genuine tea plant of China. It is been extracted from the earth by the ignorant and lazy in- Burmah. Cotton is grown in every part of the kingdom and its dependencies, but chiefly in the dry lands and climate of the upper provinces. Indigo is an indigenous product, and is universally cultivated, but in a very rude manner. It is still more rudely manufactured, and is wholly unfit for ex-

In the cultivation of fruits the Burmese are careless and unskilful. The most common fruits are the mango, the orange, the pine, the custard apple, the jack, the papaya fig, and the plantain. Most of these fruits grow spontaneously in the congenial soil and climate of the country. In horticulture and gardening the ignorance of the Burmese is remarkable. Though green vegetables and fruits form a great portion of their diet, they are at no pains to cultivate them, but are content with gathering those which grow spontaneously in the forests and marshes, such as the young shoots of the bamboo, wild asparagus, the succulent stems of a variety of aquatic plants, and other shrubs which would not be deemed fit for food in any other country. They are strangers to all the ordinary garden vegetables, such as peas, carrots, cabbages, turnips, mustard, cresses, radishes, &c. Even melons, cucumbers, and the egg-plant, so generally cultivated in India, are here little attended to. yam and the sweet potato are grown, but not extensively; and the common potato is unknown. Onions are produced; and capsicum, which, after salt, is the most ordinary condiment used by the Burmese, is cultivated everywhere.

The forests of Burmah abound in the finest trees. Among these the teak holds a conspicuous place. The finest teak forest is that of Sarawaddy, but many others exist in the provinces, and Ava the capital is supplied from a place distant fifteen days' journey. Almost every description of timber known in India is produced in the Burmese forests.1 Varnish is another useful forest product, which is employed by the Shans and the Burmese in their manufacture of lacquer ware. Stick-lack of an excellent quality is obtained in

the woods.

Minerals.

Burmah is rich in minerals, and produces gold, silver, copper, tin, lead, antimony, amber, coal, petroleum, nitre, natron, salt, limestone, and marble, noble serpentine, sapphire, and other precious stones. Gold, carried down from the higher grounds by the mountain streams, is found in the sands of different rivers; and is also found towards Lao on the eastern frontier. Silver mines, too, are wrought towards the Chinese frontier, at a place called Bor-twang, about twelve days' journey from B'hamo, which is 250 miles north by east from Ava. The mountainous districts of Lao contain almost all the other metals; but such is the rude state of the people, that they are ignorant of their value; and it is doubtful whether the copper, tin, and lead, which are seen in the market of Ava are produced in the Burmese territories, or are imported from China. Iron is found abundantly in the eastern country of Lao, and it is wrought, though with little advantage. Owing to ignorance and the want of proper machinery, about 30 or 40 per cent. of the metal is lost in the process of forging. The mountains near the capital contain lime in great abundance and of remarkable whiteness; and statuary marble, equal to the best Italian specimens, is found about 40 miles from Ava, on the eastern bank of the Irrawaddy. Mines of amber are wrought, and their produce must be abundant, judging from the price of this article, which at Ava does not exceed four shillings per pound. Nitre, natron, and salt are found in the neighbourhood of the capital, and in the upper provinces. Coal has also been discovered, and there is little doubt that it is extensively diffused. It has not, however,

singular, however, that the natives never infuse it as they do habitants, who are content to use in its stead wood, which the Chinese tea, but eat the leaf prepared with oil and garlic. is scarce and dear. Petroleum, which is used by all ranks among the Burmese for burning in lamps, and also for smearing wood as a preservative against insects, is found near the village of Re-nan-gyaong, on the banks of the Irrawaddy. Here are about eight or ten pits or wells, the general depth of which is from 210 to 240 feet; some of them are deeper, and one is sunk to the depth of 300 feet. The shaft is of a square form, about three feet in diameter, and is formed by sinking a wooden frame. The liquid appears to boil up from the bottom like an abundant spring, and is extracted in buckets, and sent to all quarters of the country In those parts where its price is raised by a long land-carriage until it comes into competition with Sesamum oil, the latter is preferred.

The precious stones which are produced in the Burmese territories are chiefly of the sapphire species and the spinelle ruby. They are found at two places, about five days' journey in a S.E. direction from the capital, in the beds of rivulets or small brooks, from which they are separated by washing. The varieties of the sapphire found there are, the blue or oriental sapphire, the red or oriental ruby, the purple or oriental amethyst, the yellow or oriental topaz, besides different varieties of chrysoberyl and spinelle. The crown, as in all despotic countries, lays claim to the produce of these rivers; and all the stones that exceed the value of L.10 are accordingly sent to the treasury. No stranger is ever permitted to approach the spots where these precious stones are found. Noble serpentine is exported in considerable quantities to China, where it is used for rings and amulets.

The country of the Burmese, abounding in forests, affords Animals. extensive shelter to the wild animals. The elephant, and the rhinoceros with a single horn, are found in all the deep forests of the country. The tiger and the leopard are numerous, as are also the wild hog, and several species of deer, such as the Indian roe and the axis. It is remarkable that no species of antelope is seen. It is said there are neither wolves, jackals, foxes, nor hyenas, in any of the tropical countries east of Bengal.

Of birds, the wild cock is common, and is seen in coveys in all the forests of the country. There are also peacocks,

varieties of pheasants, partridges, and quails.

The domestic animals of the Burmese are the ox, the buffalo, and the horse. Oxen are used for draught in the upper country, and buffaloes in the southern parts of Burmah. They are of a good description, and, ranging in the luxuriant pastures of the plains, they commonly appear in high order. The care of these animals is the only point to which much attention is paid in the rural economy of the Burmese. The buffalo is confined to agricultural labour, and the ox alone is used as a beast of burden or of draught. The Burman horses are rarely more than thirteen hands high; the full-sized horse being unknown in the tropical countries of Asia east of Bengal. Horses are never used but for riding, and only in the upper mountainous districts. Elephants are kept for the pleasure of the king, some of them of fine quality, and of a white colour. The dog, as in most other parts of the East, is neglected, and is seen prowling about the streets a prey to famine and disease. Cats are numerous; and about the capital a few goats and sheep, of a puny race, are kept more for curiosity than for use. A few asses are also seen, which are brought from China. The camel is not known even in the upper country, where it would be found extremely useful.

From their resemblance in features and form, the Bur-Population. mese appear to be of the same race as the inhabitants of

Burmah. the countries that lie between Hindustan and China. They may be generally described as of a stout, short, active, but well-proportioned form; of a brown but never of an intensely dark complexion, with black, coarse, lank, and abundant hair, and a little more beard than is possessed by the Siamese. The population of the country has been variously estimated and grossly exaggerated by the ignorance of Europeans, who have raised it to 17,000,000, 19,000,000, and even 33,000,000. There is no enumeration of the inhabitants in any part. Mr Craufurd, on the best data that he could procure, rated the inhabitants at 22 to the square mile, which, under the now contracted limits of the empire. would give a total population of 2,112,000.

Political institutions.

The Burmans appear to be inferior to the Hindus, and and judicial still more to the Chinese, in arts, manufactures, and industry, and in all the institutions of civil life. Their government is a pure despotism, the king dispensing torture, imprisonment, or death, according to his sovereign discretion. One of his customary titles is lord of the life and property of all his subjects; and they frequently find to their cost that this is no vain title. The chief object of government seems to be the personal honour and aggrandizement of the monarch; and the only restraint on the exercise of his prerogative is the fear of an insurrection. He is assisted in his administration by a public and a privy council. All questions, before they are submitted to the public advisers of his majesty, are debated in the privy council, which consists of four, to which are attached deputies, secretaries, and other officers, who carry messages, report from time to time the proceedings of the council to the king, and are in reality privileged spies. The pay-master-general is an officer of high importance; the other officers of distinction are the king's armour-bearer and the master of the elephants, who however have no share in the administration of public affairs. The king may order any of those great officers to be punished at his pleasure; and Mr Craufurd mentions, that during his residence at Ava, the favourite minister, on a complaint from some of the women of the court, was, by an order from the king, seized by the public executioner, and laid at the side of the road for two hours under the burning sun, with a weight upon his breast; and after undergoing this disgraceful punishment, continued to discharge his high functions as before. The country at large is ruled by provincial governors; and is divided into provinces, townships, districts, villages, and hamlets. The civil, military, judicial, and fis-cal administration of the province is vested in the governor, who exercises the power of life and death, though in all civil cases an appeal lies from his sentence to the chief council at the capital. In all the townships and villages there are judges with a subordinate jurisdiction. Each of the three towns composing the capital has a governor, and these governors are assisted by a sort of head constables. known to all strangers "as the busy, corrupt, and mischievous agents of the local authorities." But from a mere dry detail of the provincial administration and judicial institutions of the Burmese, their extreme inefficiency can scarcely be known. No Burmese officer ever receives a fixed salary. The higher class is paid by an assignment either of land or of the labour and industry of a given portion of the inhabitants, and the inferior magistrates by fees, perquisites, and other emoluments; and hence the most shameful extortion and bribery prevails amongst all the functionaries of the Burmese government, from the highest to the lowest. Justice is openly exposed for sale; and the exercise of the judicial functions is found to be so lucrative, that the two executive councils have by their encroachments deprived the regular judge of the greater part of his employment. So notoriously corrupt are all the judges among the Burmese, that a lawsuit is considered by all prudent men as a serious calamity.

The criminal code of the Burmese is barbarous and severe, Burmah, and the punishments inflicted are shocking to humanity. Gang robbery, desertion from the king's service, robbing of temples, and sedition or treason, are considered the most heinous crimes, and are cruelly punished, the criminal being in some cases embowelled, or thrown to wild beasts. In these cases they generally meet death with oriental indifference; and it is related of one woman who was adjudged to the latter punishment, that she deliberately crept into the cage of the tiger, and making an obeisance to the animal, was immediately killed by a single blow of his fore-paw, and dragged into the inner recesses of his den. For minor offences, fines, whipping, and imprisonment are the punishments adjudged. In important cases torture is applied both to principals and witnesses; and the jailors often torture their prisoners in order to extort money from them. The English and Americans who, during the war of 1824, were thrown into prison, were frequently tortured, and were compelled to pay fines to the jailor in order to procure milder treatment. The trial by ordeal is sometimes resorted to, as well as other superstitious modes of procedure, which denote the lowest state of barbarism. But the administration of justice among the Burmese, however vexatious and expensive, is far from efficient; and the police is as bad as can possibly be conceived. Hence the country is overrun with pirates and robbers, and a general laxity, negligence and corruption, pervade every branch of the internal administration.

Among the Burmese, society is distinguished into seven classes, which have each peculiar privileges. These are the royal family, the public officers, the priesthood, the rich men, the cultivators and labourers, slaves and outcasts. There are no hereditary honours under the Burmese government, as all the public functionaries may be dismissed from their offices, and deprived of their rank at the caprice of the sovereign. Any subject, with the exception of a slave or outcast, may, however, aspire to the first offices in the state, to which, in reality, persons of very mean origin do frequently attain. The Burmese are extremely punctilious and strict in maintaining the various orders and distinctions of society. The great officers of government hold the first rank after the king and the princes of the blood, and are distinguished by a chain or badge, which is the order of nobility, and of which there are different degrees, distinguished by the number of strings or small chains which compose the ornament. Three of open chain work mark the lowest rank; three of neatly-twisted wire the next; there are then six, nine, twelve, and finally twenty-four, which the king alone is entitled to wear. But every article possessed by a Burman for use or ornament—his ear-rings, cap of ceremony, horse-furniture, the material of his drinking-cup, if it be of gold or any other metal, the colour and quality of his umbrella (an article in general use, and one of the principal insignia of rank), whether it be of brown varnished paper, red, green, gilded, or plain white, the royal colour, all indicate the rank of the person; and if any of the lower orders usurp the insignia of a higher class, he may be slain with impunity by the first person who meets him; and so exclusive is the aristocratical spirit of the higher orders, that such a usurpation would be sure of punishment.

When a merchant acquires property he is registered by a royal edict under the name of Thuthé, or "rich man," which gives him a title to the protection of the court, while it exposes him also to regular extortion. The priesthood form a separate order, who are interdicted from all other employment, and are supported by voluntary contributions. They are distinguished by the yellow colours in their dress, which it would be reckoned sacrilege in any other person to wear; and a formal complaint was made, during the conferences with the British previous to peace, because some of their camp followers were seen dressed in yellow clothes.

vow of chastity, but may at any time quit their order. The free labouring population consist of proprietors or common labourers; and they are all considered the slaves of the king, who may at all times call for their services as soldiers, artizans, or common labourers. Hence a Burman, being the property of the king, can never quit the country without his especial permission, which is only granted for a limited time, and never to women on any pretence. The British and others who had children by Burmese women during a residence in the country experienced the greatest difficulty, even with the aid of heavy douceurs, in taking them along with them. There are two classes of slaves; namely, those who have mortgaged their services for a debt, and who are used as slaves until the debt is paid; and prisoners of war, who are always reduced to slavery. The class of outcasts consists of the slaves of the pagodas, the burners of the dead, the jailers and executioners, who are generally condemned criminals, lepers, and other incurables, who are held in great abhorrence, and treated with singular caprice and cruelty. They are condemned to dwell alone, and in a state of disgrace; and any man who is infected with leprosy, however high his rank, is forced, by continual bribes to the officers of justice, to purchase an exemption from the penalties which attach to him. Prostitutes are also considered as outcasts, but not women of loose character, chastity not being in any repute among the Burmans. The women in Ava are not shut up as in many other parts of the East, and excluded from the sight of men: on the contrary, they are suffered to appear openly in society as in Europe. In many other respects, however, they are exposed to the most degrading treatment. They are sold for a time to strangers; and the practice is not considered shameful, nor the female in any respect dishonoured. They are seldom unfaithful to their new master; and many of them have proved essentially useful to strangers in the Burmese dominions, being generally of industrious and domestic habits, and not addicted to vice.

Finance and taxes.

Manufac-

tures and

commerce.

The taxes from which the public revenue arises are in general rude and ill-contrived expedients for extortion, and are vexatious to the people at the same time that they are little productive to the state. One of the most common is the impost levied upon the proprietors of the soil by families according to a loose estimate of their supposed means, and rather resembles a property than a land tax. Nearly all the cultivated land of the kingdom is assigned to favourites of the court or to public functionaries in lieu of stipends or salaries, or is appropriated to the expenses of public establishments, such as war-boats, elephants, &c.; and this assignment conveys a right to tax the inhabitants according to the discretion of the assignee. The court favourites who receive these grants generally appoint agents to manage their estates; they pay a certain tax or quit-rent to the crown, and their agents extort from the cultivators as much more as they can by every mode of oppression, often by torture. Besides this stated tax, extraordinary contributions are levied by the council of the state directly from the lords and nobles to whom the lands are assigned, who in their turn levy it from the cultivators, and generally make it a pretence for plunder and extortion. Taxes are also laid on fruit-trees, on the teak forests, on the petroleum springs, on mines of gold and recious stones, on the fishery of ponds, lakes, rivers, and salt water creeks, on the manufacture of salt, on the eggs of the green turtle, and on esculent swallows' nests. There are no transit duties, nor any duties at fairs or markets; and as the consumption of wines, spirits, opium, and other intoxicating drugs, is forbidden by law, they cannot of course be subject to any tax.

In the useful arts the Burmese have not made any great advances. The whole process of the cotton manufacture is performed by women, who use a very rude species of loom,

Burmah. There is also an order of nuns or priestesses, who make a and are much inferior in dexterity to the Indian artisans Burmah. No fine linen is ever made at home; and the home manufacturer, even in the interior of the country, cannot withstand the competition of British cotton goods. Silk cloths are manufactured at different places; the finest at Ava or Amarapura, from raw Chinese silk. The common coarse unglazed earthenware, which is manufactured in Ava, is of an excellent quality; and a better description of pottery is also made. They are entirely ignorant of the art of making porcelain, which is imported from China. Iron ore, as already mentioned, is smelted; but the Burmans cannot manufacture steel, which is brought from Bengal. Coarse articles of cutlery, including swords, spears, knives, also muskets and matchlocks, scissors, and carpenters' tools, are manufactured at Ava. Gold and silver ornaments are produced in every considerable place in the country, but in a decidedly rude and clumsy manner. About 40 miles from Ava, on the eastern bank of the Irrawaddy, is an entire hill of pure white marble. Here are sculptured marble images of Gautama or Buddha. The marble is of the finest quality; but the workmanship is rude, and displays neither taste nor fancy. Since Burmah was deprived of its harbours and maritime districts, its commerce has been extremely limited. The trade of the country centres chiefly in Ava, the capital. The imports are rice, pickled and dried fish, and foreign commodities imported from Bengal, the Asiatic Archipelago, and Europe. Petroleum, which, as already mentioned, is a great article of internal consumption: saltpetre, lime, paper, lacquer ware, cotton and silk fabrics, iron, cutlery, some brass ware, terra japonica, sugar, and tamarinds, are given in exchange. One of the most important branches of the trade of Ava is that carried on with the Chinese province of Yunan. The principal marts of this trade are Midé, six miles to the N.E. of Ava; and B'hamo, the chief place of a province of the same name, bordering on China. It is carried on at annual fairs. The Chinese caravan, setting out from the western province of Yunan at the close of the periodical rains, generally reaches Burmah in the beginning of December, after a journey of six weeks over difficult and mountainous roads, on which only horses, mules, and asses can travel. No part of the journey is by water; from which it would appear that the upper streams of the Irrawaddy, near to the Chinese frontier, are not navigable. The principal fair is, however, held at B'hamo, comparatively few traders arriving at Ava. The articles imported from China are wrought copper; orpiment or yellow arsenic from the mines in Yunan, of a very fine quality, which finds its way into western Asia, and into Europe through Calcutta; quicksilver, vermilion, iron pans, brass wire, tin, lead, alum, silver, gold and gold-leaf; earthenware, paints, carpets, rhubarb, tea, honey, raw silk, velvets and other wrought silks; spirits, musk, verdigris, dry fruits, paper, fans, umbrellas, shoes, and wearing apparel. The metals are chiefly produced in the province of Yunan, which, though poor, is rich in minerals. The tea, which is coarse and black, is supposed to be from the same province. The articles sent to China consist of raw cotton, by far the most considerable article of export; feathers, chiefly of the blue jay, for ornamenting the dresses of ceremony of the Chinese mandarins; esculent swallows' nests, ivory, rhinoceros' and deers' horns; sapphires, used for buttons to the caps of the Chinese officers of rank, and noble serpentine, with a small quantity of British woollens.

The progress and civilization of a country may be generally very accurately measured by the state of its currency; and that used by the Burmese is of the rudest description. For the smaller payments lead is employed; and for the larger payments gold or silver, but principally the latter. These are not coined into pieces of any known weight and fineness; and in every payment of any consequence the metal must be weighed and generally assayed, for which

Religion.

History.

Burmah. a premium is paid to the bankers or money-changers of 2½ per cent, besides 1 per cent which they say is lost in the operation. These bankers are said by Symes to be workers in silver; and every merchant has one with whom he lodges his cash, and who receives on this account a commission of 1 per cent. The want of a more convenient currency must tend greatly to embarrass the operations of trade. The high rate of interest for money-which is 25 per cent., and 60 per cent. when no security is given—is another proof of the low state of commerce among the Burmese.

The Burmese, as may be supposed, are entirely ignorant of literature and science. Their astronomy and astrology they have borrowed from the Hindus. They are ignorant of navigation; and in their voyages to Calcutta, during the fine season, they creep along the coast, never losing sight of it. Morality is at a low ebb among them, and their rulers have no conception of either the excellence or utility of good faith. "They would," says the Rev. Mr Judson, the American missionary, "consider it nothing less than folly to keep a treaty if they could gain anything by breaking it." fidelity observed by the British government in fulfilling the stipulations of the late treaty stupified the Burmans. They knew not what to make of it, but some of them have now begun to admire it. "I heard many make use of expressions like the following: 'These Kulas (English), though they drink spirits and slay cattle, and are ambitious and rapacious, have a regard for truth and their word, which is quite extraordinary; whereas in us Burmesc there is no truth.' first circumstance in the conduct of the British which struck them with surprise was the return of Dr Sandford on his parole; and next, Sir A. Campbell's returning six lacs of rupees offered him after the money was in his power."

The Burmese are not votaries of Brahma, but sectaries of Buddha, who is universally considered by the Hindus as the ninth Avatar, co-descent of the Deity in his capacity of preserver; and the rites doctrines, and priesthood are nearly the same as in other countries where Buddhism prevails. Neither Christianity nor Mahommedanism has made any progress. Foreigners enjoy religious toleration, but the Burmese rulers view any attempt to convert the natives to the Christian or any other foreign faith as an interference with their allegiance, and they discourage all such schemes. An American mission was settled in the country under the conduct of Mr Judson before mentioned, who brought to the execution of this perilous service zeal and sound discretion; but it entirely failed of success, not from any bigotry on the part of the natives, but from the opposition of men in power. On the war breaking out with the British, the missionaries were imprisoned, and narrowly escaped with their lives. They are now prosecuting their missionary labours in the British province of Martaban.

The ancient history of Ava is very imperfectly known; the more early records relating chiefly to dynasties of which little more is given than their names. We learn from the Portuguese navigators that about the middle of the sixteenth century four powerful states ruled over those countries which lie between the S.E. province of British India, Yunan in China, and the Eastern Sea, namely, Arracan, Ava, Pegu, and Siam. By the help of the Portuguese the Burmans subdued the Peguans, and maintained their supremacy over them throughout the seventeenth and during the first forty years of the eighteenth century, when the Peguans revolted, and a war ensued, in the course of which, by the aid of arms procured from Europeans, they gained several victories over the Burmans, and having taken their capital Ava, and made the king prisoner, they reduced the whole country to submission. Alompra, who had been left by the conqueror in charge of Monchaboo, an inconsiderable village, planned the deliverance of his country. He attacked the usurpers at first with small detachments; but when his forces increased, he suddenly advanced, and took

possession of the capital in the autumn of 1753. In 1754 Burmah. the Peguans, anxious to recover their lost conquests, sent an armament of war-boats against Ava; but after an obstinate and bloody battle they were totally defeated by Alompra. In the districts of Prome, Donabew, Loonzay, &c. the Burmans revolted, and succeeded either in expelling or putting to the sword all the Pegu garrisons in their towns. In 1754 Prome was besieged by the king of Pegu, who was again defeated by Alompra in a severe battle, and the war was transferred from the upper provinces to the mouths of the navigable rivers, and the numerous creeks and canals which intersect the lower country. In 1755 Alompra defeated in a general battle Apporaza the king of Pegu's brother, after which the Peguans were driven from Bassein and the adjacent country, and were forced to withdraw to the fortress of Syriam, distant twelve miles from Rangoon. Here they enjoyed a brief repose, Alompra being called away to quell an insurrection of his own subjects, and to repel an invasion of the Siamese; but returning victorious, he laid siege to the fortress of Syriam and took it by surprise, when the garrison were mostly put to the sword, the Europeans being made prisoners. In these wars the French sided with the Peguans, the English with the Burmans. Dupleix, the governor of Pondicherry, had sent two ships to the aid of the former; but the master of the first was decoyed up the river by Alompra, when his vessel was taken, and he, along with his whole crew, was massacred. The other escaped by being accidentally delayed, and carried accounts of this disaster to Pondicherry. Alompra was now master of all the navigable rivers; and the Peguans, being entirely shut out from foreign aid, were finally subdued. In 1757 the conqueror laid siege to the city of Pegu, which finally capitulated, on condition that the king should govern the country, but that he should do homage for his kingdom, and should also surrender his daughter to the victorious monarch. Alompra, with Asiatic perfidy, never contemplated the fulfilment of the earlier of these conditions; and having succeeded in obtaining possession of the town, through the imbecility of the king, abandoned it to the fury of his soldiers. In the following year the Peguans endeavoured to throw off the yoke, but they were overthrown in a decisive engagement near Rangoon; and Alompra arriving soon after, quelled the rebellion. He afterwards reduced the town and district of Tavoy, and finally undertook the conquest of the Siamese. His army advanced to Mergui and Tennasserim, both which towns were taken; and he was besieging the capital of Siam when he was taken ill. He immediately ordered his army to retreat, in hopes of reaching his capital alive; but he expired on the way, in 1760, in the fiftieth year of his age, after he had reigned eight years. He was succeeded by his oldest son Namdojee Praw, whose reign was disturbed by the rebellion of his brother Shembuan, and afterwards by one of his father's generals. By his vigour he succeeded in quelling these revolts; and he afterwards turned his arms against the refractory Peguans, whom he reduced to subjection. He died in little more than three years, leaving one son in his infancy. On his decease the throne was seized by his brother Shembuan. He was intent, like his predecessors, on the conquest of the adjacent states; and he accordingly made war in 1765 on the Munnipore Cassayers, and also on the Siamese, with partial success. In the following year he renewed the war with the latter, defeated the Siamese, and, after a long blockade, obtained possession of their capital. But while the Burmans were extending their conquests in this quarter, they were invaded by a Chinese army of 50,000 men from the province of Yunan. This army was hemmed in by the skill of the Burmans; and being reduced by the want of provisions, it was afterwards attacked and totally destroyed, with the exception of 2500 men, who were sent in fetters to work in the Burmese capital at their several trades. In the meantime the Siamese revolted from the Burmese

Burmah. voke; and while the Burman army was marching against them, the Peguan soldiers who had been incorporated in it rose against their companions, and commencing an indiscriminate massacre, pursued the Burman army to the gates of Rangoon, which they besieged, but were unable to capture. In 1774 Shembuan was engaged in reducing the marauding tribes. He took the district and fort of Martaban from the revolted Peguans; and in the following year he sailed down the Irrawaddy with an army of 50,000 men, and, arriving at Rangoon, put to death the aged monarch of Pegu along with many of his nobles, who had shared with him in the offence of rebellion. He died in 1776, after a reign of twelve years, during which he had extended the Burmese dominions on every side, having reduced to a state of vassalage the petty states in the neighbourhood, and the uncivilized tribes in the western hills, as well as those in the mountainous tracts to the east of the Irrawaddy. He was succeeded by his son, a youth of eighteen, who proved himself a bloodthirsty despot, and was put to death by his uncle Mindragee Praw in 1782, who ascended the vacant throne, and in 1783 sent a fleet of boats against Arracan, which was conquered, and the rajah and his family were made prisoners. Cheduba, Ramnee, and the Broken Isles soon afterwards

> The Siamese who had revolted in 1771 were never afterwards subdued by the Burmans. They retained their dominion over the sea-coast as far as Mergui; and in the year 1785 they attacked the island of Junkseylon with a fleet of boats and an army. But they were ultimately driven back with loss; and a second attempt by the Burman monarch, who in 1786 invaded Siam with an army of 30,000 men, was attended with no better success. In 1793 peace was concluded between these two powers, the Siamese yielding to the Burmans the entire possession of the coast of Tennasserim on the Indian Ocean, and the two important seaports of Mergui and Tavoy.

> In 1795 the Burmese were involved in a dispute with the British in India, in consequence of their troops to the amount of 5000 men entering the district of Chittagong in pursuit of three robbers who had fled from justice across the frontier. Explanations being made, and terms of accommodation offered by General Erskine, the commanding officer, the Burmese commander retired from the British territories, when the fugitives were restored, and all differences for the

time amicably arranged.

But it was evident that the gradual extension of the British and Burmese territories would in time bring the two powers into close contact along a more extended line of frontier, and in all probability lead to a war between them. It happened, accordingly, that the Burmese, carrying their arms into Assam and Munnepore, penetrated to the British border near Sylhet, on the N.E. frontier of Bengal, beyond which were the possessions of the chiefs of Cachar, under the protection of the British government. The Burmese leaders, arrested in this manner in their career of conquest, and flushed with past success, were impatient to measure their strength with their new neighbours. It appears from the evidence of Europeans who resided in Ava, that they were entirely unacquainted with the discipline and great military resources of the Europeans. They imagined that, like the other nations in the East, they would fall before their superior tactics and valour; and their cupidity was inflamed by the prospect of marching to Calcutta and of plundering the country. With such dispositions, it was not to be supposed that causes of quarrel would long be wanting. Petty acts of aggression were first committed. At length their chiefs, throwing off the mask, ventured on the open violation of the British territories. They attacked a party of sepoys within the frontier, seized and carried off British

subjects, and at all points their troops, moving in large Burmah. bodies, assumed the most menacing positions. In the south encroachments were made upon the British frontier of Chittagong. The island of Shaparee, at the mouth of the Naaf river, had been occupied by a small guard of British troops These were attacked on the 23d September 1823, during the night, by the Burmese, and driven from their post with the loss of several lives; and to the repeated demands of the British for redress no answer was returned. Other outrages ensued; and at length, in February 1824, war was

declared by the British government.

Hostilities having commenced, the British rulers in India, with their usual boldness and energy, resolved to carry the war into the enemy's country; and with this view an armament was fitted out under the orders of Commodore Grant and Sir Archibald Campbell, which entered the Irrawaddy river, and anchored off Rangoon on the 10th May 1824. After a feeble resistance this great seaport of the Burmese surrendered, and the troops were landed. The place was entirely deserted by its inhabitants, the provisions were carried off or destroyed, and the invading force took possession of a complete solitude. On the 28th May, Sir A. Campbell ordered an attack to be made on some of the nearest posts of the enemy, which were all carried after a feeble defence. Another attack was made on the 10th June on the stoccades at the village of Kemmendine. Some of these, being too strong to be attacked by escalade, were battered by artillery; and the shot and shells struck such terror into the Burmese that they fled from their works in the utmost precipitation. It soon, however, became apparent, that the expedition had been undertaken with very imperfect knowledge of the country, and without adequate provision for securing supplies. The devastation of the country, which was part of the defensive system of the Burmese, was carried into execution with unrelenting rigour, and the invaders were soon reduced to great difficulties. The health of the men rapidly declined, and their ranks were fearfully thinned by disease. Enraged by the defeats hitherto sustained, the monarch of Ava sent large reinforcements to his dispirited and beaten army; and early in July an attack was commenced on the British line, but proved unsuccessful. On the 8th, the British general directed an assault to be made on the enemy's entrenched positions, in which the armament on the river co-operated with the land force. The enemy were beaten as formerly at all points; and their strongest stoccaded works, battered to pieces by a powerful artillery, were in general abandoned by their defenders. Towards the end of August an attack was made on the British position by the prince of Sarawaddy, which was quickly repelled. But with this exception, the enemy having learned by fatal experience the necessity of caution, had allowed the British to remain unmolested in their quarters during the months of July and August. This interval of leisure was employed by Sir A. Campbell in subduing the maritime provinces of the Burmese to the east, namely, Tavoy, Mergui, and the whole coast of Tennasserim, which quickly submitted to the British arms. This was an important conquest, as the country proved to be salubrious, and afforded convalescent stations to the sick, who were now so numerous in the British army, owing to severe duty, and to the incessant rains and privations of every kind to which they were exposed, that scarcely 3000 soldiers fit for duty could be mustered in the lines. The climate of Mergui proved to be so healthy that the sick who had been languishing for months at Rangoon rapidly recovered. An expedition was about this time sent against the old Portuguese fort and factory of Syriam, at the mouth of the Pegu river, which was taken; and in October the province of Martaban was reduced under the authority of the British.

Burmah.

The rainy season terminated about the end of October; and the court of Ava, alarmed by the discomfiture of its numerous armies, resolved on recalling the veteran legions which were employed in Arracan, under their renowned leader Maha Bandoola, in vain attempts to penetrate the British frontier. Relinquishing his plans of offensive war, Bandoola, with his army, hastened by forced marches to the defence of his country; and by the end of November an army of 60,000 men had surrounded the British position at Rangoon and Kemmendine, for the defence of which Sir Archibald Campbell had only 5000 efficient troops. On the 1st December the enemy in great force made repeated attacks on the post of Kemmendine, nowise daunted by the heavy broadsides which were poured from the shipping in the river. These attacks were invariably repulsed by the steadiness of the troops—the last, which was made after dusk, with great loss; and the fire rafts which had been set affoat for the destruction of the shipping, were towed by the sailors to the shore, where they occasioned no injury. Several encounters took place with the enemy on the succeeding days; and on the 7th the army of Bandoola was completely routed in a general attack by Sir A. Campbell. The fugitives retired to a strong position on the river, which they again entrenched; and here they were attacked by the British on the 15th, who, surmounting every obstacle, carried the stoccaded ramparts at the point of the bayonet, and drove the enemy in complete confusion from the field. After this defeat the remnant of the Burmese army retreated to Donabew.

Sir Archibald Campbell, thus victorious in every encounter, now resolved to advance on Prome, about 100 miles higher up the Irrawaddy river. Having provided the means of transport, and having succeeded in acquiring the confidence of the inhabitants, many of whom had returned to their homes, and were found extremely useful to the army, he moved with his force on the 13th February in two divisions, one proceeding by land, and the other, under General Cotton, destined for the reduction of Donabew, being embarked on the flotilla. Sir Archibald Campbell, taking the command of the land force, continued his advance till the 11th March, when intelligence reached him of the failure of the attack upon Donabew. He instantly commenced a retrograde march; on the 27th he effected a junction with General Cotton's force, and on the 2d April carried the entrenchments at Donabew with little resistance, the enemy being panic struck by the death of the general-in-chief, Maha Bandoola, who was killed by the explosion of a bomb. Sir A. Campbell, resuming his march to Prome, entered that place on the 25th, the Burmese flying at his approach, after setting fire to the town. Here he remained during the rainy season to refresh his troops, exhausted by privations and severe service. On the 17th September an armistice was concluded between the contending armies for one month. In the course of the summer General Morrison had conquered the province of Arracan; in the north the Burmese were expelled from Assam; and the British had made some progress in Cachar, though their advance was finally impeded by the thick forests and jungle with which the country was covered.

The armistice between the Burmese and Sir A. Campbell having expired on the 17th October, the army of Ava, amounting to 60,000 men, advanced in three divisions against the British position at Prome, which was defended by 3000 Europeans and 2000 native troops. But the science, courage, superior equipment, and high discipline of the British still triumphed over the undisciplined hordes of the Burmese army, who being hastily brought together, and inexperienced in war, were unable to withstand the close encounter of their veteran adversaries. After several actions, in which the Burmese were the assailants and were partially successful, Sir A. Campbell, on the 1st December,

attacked the different divisions of their army, which were Burmah, imprudently separated from each other, and which, notwithstanding the entrenchments by which they were protected, were, in the course of four days, successively driven from all their positions and dispersed in every direction. The Burmese retired on Meaday and afterwards on Mellone, along the course of the Irrawaddy, where they occupied, with 10,000 or 12,000 men, a series of strongly fortified heights and a formidable stoccade. On the 26th they sent a flag of truce to the British camp; and a negotiation having commenced, peace was proposed to them on the fol-lowing conditions: 1st, The cession of Arracan, together with the provinces of Mergui, Tavoy, and Yea; 2d, The renunciation by the Burmese sovereign of all claims upon Assam, and its contiguous petty states; 3d, The company to be paid a crore of rupees as an indemnification for the expenses of the war; 4th, Residents from each court to be allowed, with an escort of fifty men. It was also stipulated that British ships should no longer be obliged to unship their rudders and land their guns as formerly in the Burmese ports. This treaty was agreed to and signed, but the ratification of the king was still wanting; and it was soon apparent that the Burmese had no intention to send it, but were preparing to renew the contest. On the 19th January, accordingly, Sir A. Campbell attacked the enemy's position at Mellone and carried it, the Burmese troops abandoning their defences in complete disorder. Another offer of peace was here made, which was found to be insincere; and the fugitive army resolved to make at Pagahm-Mew a final stand in defence of the capital. They were attacked and overthrown on the 9th February 1826; and the invading force being now within four days' march of Ava, Dr Price, an American missionary, who with other Europeans had been thrown into prison when the war commenced, was sent to the British camp with the treaty ratified, the prisoners of war released, and an instalment of 25 lacs of rupees. The war was thus brought to a successful termination, and the British army evacuated the country.

For some years the relations of peace continued undisturbed. Probably the feeling of amity on the part of the Burmese government was not very strong; but so long as the prince by whom the treaty was concluded continued to hold the reins of power, no attempt was made to depart from its main stipulations. That monarch, however, was obliged in 1837 to yield the throne to a usurper who appeared in the person of his brother. This latter personage, at an early period, manifested that hatred of British connection which was almost universal at the Burmese court, and which probably had been shared by the deposed ruler, though he had the prudence to conceal it. For several years it had become apparent, that the period was approaching when war between the British and the Burmese governments would again become inevitable. The British Resident finding his presence at Ava agreeable neither to the king nor to himself, removed in the first instance, under instructions from his government, to Rangoon. Ultimately it became necessary to forego even the pretence of maintaining relations of friendship, and the British functionary was properly withdrawn altogether from a country where his continuance would have been but a mockery. The state of sullen dislike which followed was after a while succeeded by more active evidences of hostility. Acts of violence were committed on British ships and on British seamen, who had proceeded to Burmese ports in the exercise of their lawful calling, and in a friendly spirit; their only purpose being the prosecution of their trade. As the tame submission of the British government to such treatment would have been utterly incompatible with either the national interest or the national honour, remonstrance was made, backed in the only way by which remonstrance could, under such circumstances, be rendered effectual, by a small naval force. The officers

Burman, on whom devolved the duty of representing the wrongs of their fellow-countrymen, and demanding redress, proceeded to Rangoon, the governor of which place had been a chief actor in the outrages complained of; but so far were they from meeting with any signs of regret, that they were treated with indignity and contempt, and compelled to retire without accomplishing anything beyond blockading the ports. A series of negotiations followed; negotiations conducted on one side in a spirit of sincerity, on the other with no feelings but those of rancour and duplicity. Nothing was demanded of the Burmese beyond a very moderate compensation for the injuries inflicted on the masters of two British vessels, an apology for the insults offered by the governor of Rangoon to the representatives of the British government, and the re-establishment of at least the appearance of friendly relations, by the reception of a British agent by the Burmese government. But notwithstanding the severe lessons formerly received, the obduracy of that government led to the refusal alike of remuneration for past

wrongs, though the sum required was of very trifling amount, of any expression of regret for the display of gratuitous insolence, and of any indication of a desire to maintain friendship for the future. Another Burmese war was the result; and as in the former, though success was varying, the British finally triumphed. The chief towns in the lower part of the Burmese kingdom fell to them in succession. The city of Pegu, the capital of that portion which, after having been captured, had again passed into the hands of the enemy, was recaptured and retained, and the whole province of Pegu was, by proclamation of the governor-general, declared to be annexed to the British dominions. No treaty was obtained or insisted upon—the British government being content with the tacit acquiescence of the king of Burmah without such documents; but its intention was declared, that any active demonstration of hostility by him would be followed by retribution. And thus in 1853 closed the war forced on the British government in the previous (D. B-N.) (E. T.)

BURMAN, CASPAR, the son of the famous theologian of Utrecht, Francis Burman, was born in that city about the beginning of the eighteenth century. Of his works, none of which are of much importance, the best known are his Hadrianus VI., published at Utrecht in 1727, and his Trajectum Eruditum, a biographical history of the eminent scholars and philosophers of his native town. He died in 1755.

BURMAN, Francis, a learned biblical critic of the seventeenth century, was born at Leyden in 1632. At the age of twenty-three he became pastor of the Dutch congregation of Hanau in Germany, but in 1661 returned to Leyden as sub-rector of the College of Orders. From Leyden he removed to Utrecht, where he taught theology with much acceptance till his death in 1679. His works, which are very numerous, consist chiefly of commentaries on some of the Old Testament, and are written in Dutch, Latin, and German.

Burman, Francis, a celebrated theologian and sacred poet of Holland, was born at Utrecht in 1671. He studied in his native city under Grævius, and afterwards removed to Leyden, where he made great attainments in mathematics and philosophy. In 1698 he became pastor of Coodom in Friesland, and four years later accompanied the Dutch embassy sent to London to congratulate Queen Anne on her accession to the English throne. On his return to Holland he accepted an invitation to become pastor of Enckhuysen-where he remained for two years. At the end of that period he removed to Amsterdam and resided there for ten years, teaching and preaching with much success. In 1714 he was elected to a theological chair at Utrecht, where he died after a short illness in 1719. Of his numerous works, we may specify his Burmannorum pietas, in which he vindicates the memory of his father from the charge of Spinozism alleged against him by Philip Limbourg of Amsterdam; and his Theologus, Utrecht, 1715.

BURMAN, John, a distinguished Dutch physician, son of the preceding, born at Amsterdam in 1706. He studied the physical sciences at Leyden with such success, that in 1738 he was appointed professor of botany at Amsterdam in room of the celebrated Ruysch. His merits as a botanist were such, that Linnæus, who was under many obligations to him, called a genus of plants after his name, Burmannia. His dissertation de Chylopoiesi was published at Leyden in 1728, and his Thesaurus Zeylanicus at Amsterdam in 1737. At this latter city he died in 1780.

BURMAN, Peter, a philologer and critic of high reputation, was born at Utrecht on the 26th June 1668. His father, Francis Burman, professor of divinity in that university, was the son of a German clergyman, whom the destruc-

tive war of the Palatinate had driven from Frankenthal; his mother was Mary the daughter of Abraham Heydan, professor of divinity in the university of Leyden. Thus he was doubly connected with men of letters, and various members of the same family distinguished themselves by their writ-While he was yet in the eleventh year of his age, he had the misfortune to lose his pious and learned father; but this loss, great as it certainly was, appears to have been in a very considerable degree supplied by the assiduity, prudence, and piety of his mother. He was educated in the public school of Utrecht, where his progress must have been very rapid, for at the age of thirteen he became a student in the university. For several years he attended the lectures of Grævius, a professor of great learning and eminence, who ably blended Greek with Latin erudition, and to whose private friendship, joined to his public instructions, Burman seems to have been in a great measure indebted for that strong predilection which he continued to evince for philological studies. Here, among other departments of literature, he assiduously cultivated Latin composition, and he gradually attained to no mean proficiency both as an orator and a poet.

Burman's original destination was for the legal profession; and after having devoted some years to literature, he next applied himself to the study of the law. The university of Utrecht was then highly distinguished as a school of jurisprudence, and among other great names, it could boast of Noodt, one of the ablest civilians of modern times. He attended the lectures of this professor, and likewise those of Van Muyden and Van de Poll, who both taught the municipal as well as the civil law; nor did he neglect the lectures of H. Cocceii on the feudal law, and on the treatise of Grotius De Jure Belli ac Pacis. A further proof of his assiduity he exhibited in a dissertation De Vicesima Hæreditatum, which he publicly defended with

It is a common practice for the more liberal and inquisitive students of Holland and Germany to pass from one university to another, and the practice has an obvious tendency to improve the youthful mind, by removing local prejudices, and by introducing a new current of refined thought. Burman accordingly spent a year at Leyden, where he studied philosophy under Volder, but in the mean time did not neglect his favourite pursuits of classical erudition. He attended the lectures of the younger Gronovius on some of the Greek writers, together with those of Ryckius on Tacitus. Of this Latin historian, the latter professor was about that period engaged in preparing a new edition, with a separate volume of animadversions. Returning to the university of Utrecht, he continued to

instructions and advice. In the month of March 1688 he took the degree of doctor of laws, having previously written and defended a learned dissertation De Transactionibus. "The attainment of this honour," as Dr Johnson has remarked, "was far from having upon Burman that effect which has been too often observed to be produced in others, who, having in their own opinion no higher object of ambition, have elapsed into idleness and security, and spent the rest of their lives in a lazy enjoyment of their academical dignities. Burman aspired to further improvements, and, not satisfied with the opportunities of literary conversation which Utrecht afforded, travelled into Switzerland and Germany, where he gained an increase both of fame and learning.

But having made choice of a profession, it had now become necessary to enter upon a new course; and on his return to his native city, he applied his talents and learning to the practice of the law. We are informed that he pleaded various causes with much force and eloquence; nor will this account appear improbable to those who are acquainted with the vigour and decision displayed in his ordinary strain of composition. On the first of December 1691 he was appointed receiver of the tithes which were originally paid to the bishop of Utrecht: this was an office of considerable credit, and was usually bestowed upon persons of some distinction. While engaged in these occupations, he married Eve Clotterboke, the daughter of a burgomaster of Briel, much commended for her beauty and accomplishments. She became the mother of ten children, eight of whom died at an early age, and only two sons survived their father. This learned advocate might have risen to great eminence in his profession; but as the love of letters was his predominant passion, he gladly availed himself of an opportunity of leaving the bar and returning to the university. A recommendation from his friend Grævius to the magistrates of Utrecht procured him the professorship of eloquence and history, to which was afterwards added the professorship of the Greek language, and that of politics. His first appointment was that of an extraordinary professor, or of a professor extra ordinem. He took possession of his chair on the 10th of December 1696; and on that occasion pronounced an oration De Eloquentia et Poetice. His academical labours, which were thus so various, must likewise have been very formidable; but being a man of an excellent capacity, and of unwearied application, he ably performed whatever he had undertaken, and gradually acquired a high and merited reputation. His lectures attracted a numerous auditory, and his multifarious publications rendered his name familiarly known wherever ancient learning was successfully cultivated. The most serious labours of his life were devoted to the illustration of few rivals.

Soon after his appointment to the professorship, he published a collection of letters from learned men, and chiefly relating to topics of learning: "Marquardi Gudii

Burman. cultivate the friendship of Grævius, and to profit by his bibliotheca auctiores; curante Petro Burmanno." Ultra- Burman. jecti, 1697, 4to. About the same period he prepared an edition of Phædrus. Amst. 1698, 8vo. This edition was twice reprinted; and after an interval of nearly thirty years, he published the same poet with a new commentary. He next produced "Q. Horatius Flaccus. Accedunt J. Rutgersii Lectiones Venusinæ." Traj. Batav. 1699, 12mo. Burman has prefixed a dedication and preface, but the only notes which occur are those of Janus Rutgersius, who died in the year 1625, after having established no mean reputation as a scholar by the publication of his Varia Lectiones. These editions were followed by a learned dissertation, entitled " Zeus Karascarns, sive Jupiter Fulgerator in Cyrrhestarum Nummis." Traj. Bat. 1700, 4to. Resuming the illustration of the Latin poets, he now prepared an edition of Valerius Flaccus. Ultraj. 1701, 12mo. This edition includes the notes of N. Heinsius, who had himself published the text in 1680; but after a long interval, Burman edited the same poet with more ample illustrations, which were partly derived from various other critics. Leidæ, 1724, 4to. He was chosen rector of the university in 1703, and again in 1711.

Grævius, one of the chief ornaments of the university of Utrecht, died in the year 1703, and his grateful pupil honoured his memory by a funeral oration, which is ably and affectionately written, and contains an interesting sketch of his life and character. His great and valuable collection of writers on Roman antiquities is well known among scholars. He engaged in a more extensive undertaking, a collection of writers on the history and antiquities of Italy; and after his decease, the charge of inspecting its progress devolved upon Burman, who contributed nine different prefaces. "Thesaurus Antiquitatum et Historiarum Italiæ." Lugd. Bat. 1704-25, 45 tom. fol. The book is described in the title as "tomis x. vel voluminibus xlv. distinctus;" each volume consisting of several parts, which amount to the size of volumes. Burman likewise wrote the preface to an edition, undertaken by Grævius, of Gruter's "Inscriptiones Antiquæ totius Orbis Romani." Amst. 1707, 2 tom. fol.

His next literary enterprise was an edition of a prose writer, Petronius Arbiter. Traj. ad Rhen. 1709, 4to. The learned editor was attacked in an anonymous publication, consisting of a few pages, and bearing the title of "Burmanniana, sive Calumniarum Petri Burmanni in Collegas et Populares Specimen." Amst. 1710, 12mo. These calumnies are collected from his annotations on Petronius. His most elaborate edition was very unfavourably noticed by Le Clerc, who by the freedom of his strictures in various publications, more particularly in his different Bibliotheques, had excited the resentment of many eminent members of the republic of letters. Of grammarians and verbal critics he spoke with habitual contempt, and thus the Roman classics, and in this department he had but increased the offence that was merely personal. Some of his philological mistakes had been exposed by Perizonius, but he was attacked by Burman in a more ferocious manner. His literary delinquencies were fiercely discussed in the preface to Petronius; and his contemptuous review et doctorum Virorum ad eum Epistolæ; quibus accedunt of the edition was followed by a volume entitled "Le ex bibliotheca Gudiana clarissimorum et doctissimorum Gazettier Menteur, ou Mr. Le Clerc convaincu de Men-Virorum, qui superiore et nostro sæculo floruerunt, et songe et de Calomnie, par Pierre Burman." Utrecht, Claudii Sarravii, Senatoris Parisiensis, Epistolæ ex eadem 1710, 12mo. Whatever may have been the extent of the

¹ Bibliothèque Choisie, tom. xix. p. 351.—Le Clerc commences his review in the following terms: "Je ne mets pas ici cette edition," pour en rendre compte au public. Il n'y a rien qui mérite son attention." The rest of the article is written in the same strain of disparagement, nor has the author confined himself to his adversary's literary character. The subsequent passage refers to his morals: "Je ne parlerai pas de l'imprudence qu'il y a è parler ainsi, pendant un procès, où une fille l'accuse de l'avoir débauchée." P. 365. The learned professor has adverted to this charge, but, as it appears to us, not in such clear and direct terms of disavowal as might naturally have been expected from a man conscious of his innocence. (Burman, Gazettier Menteur, p. 24.) Le Clerc ascribes to him a satire against himself, published the year 1703, in the form of a Latin dialogue between Spudæus and Gorallus; and the manner in which Burman speaks of it seems to justify his suspicions. manner in which Burman speaks of it seems to justify his suspicions,

Burman. provocation, and it was by no means inconsiderable, the he had so often praised; and, as a real proof of his re- Burman. not equalled by his learning.1 "Chrestomathia Petronio-Burmanniana; sive Cornu-copiæ Observationum eruditissimarum et ante plane inauditarum, quas vir illuminatissimus, rerum omnium, et multarum præterea aliarum, peritissimus, Petrus Burmannus congessit in Petronium Arbitrum, scriptorum sanctissimum. Accessit Specimen Latinitatis novæ, Romanis incognitæ, e Notis Petri Burmanni ad Petronium." Florentiæ, 1734, 8vo. Although the work thus bears the imprint of Florence, the typography is apparently Dutch. Another edition of Petronius appeared after the death of the indefatigable editor. Lugd. Bat. 1743, 4to. Le Clerc had published his unfortunate edition of Menander and Philemon in the year 1709; and in the course of the ensuing spring Dr Bentley, under an assumed name, transmitted his Emendationes to Burman, who lost no time in communicating to the public such a morsel of criticism. Traj. ad Rhen. 1710, Svo. Under his own name, he prefixed a preface of thirty-four pages, in which he assailed Le Clerc with extreme virulence, and enumerated many errors which the author had left unnoticed. Not satisfied with relieving his spleen in this manner, he added a poetical address to the Manes of the injured poets, in which he endeavoured to condense the esreader may be enabled to judge from a brief specimen

> Scilicet hæc nostris servata informia seclis Prodigia, et nullis monstra pianda sacris.

Burman soon afterwards published a compendium entitled "Antiquitatum Romanarum brevis Descriptio." Ultraj. 1711, 8vo. His early study of jurisprudence was not without its advantages in those departments of literature to which he devoted himself with such persevering energy. His knowledge of the civil law he found of frequent use in illustrating the Latin classics; and he published an elaborate and valuable work which bears a refe-Romani Dissertatio." Ultraj. 1714, 8vo. Of this dissertation the original sketch had appeared in 1694; and he lived to publish an edition greatly improved, and combined with his Jupiter Fulgerator. Leidæ, 1734, 4to.

of visiting Paris, not only for the sake of conferring in person, upon questions of literature, with the learned men of that place, and of gratifying his curiosity with a more familiar knowledge of those writers whose works he admired, but with a view more important, of visiting the libraries, and making those enquiries which might be of advantage to his darling study. The vacation of the university allowed him to stay at Paris but six weeks, which he employed with so much dexterity and industry, that he had searched the principal libraries, collated a great number of manuscripts and printed copies, and brought back a great treasure of curious observations. In this visit to Paris he contracted an acquaintance, among other learned men, with the celebrated Father Montfaucon, with whom he conversed, at their first interview, with no other character than that of a traveller; but their discourse turning upon ancient learning, the stranger soon gave such proofs of his attainments, that Montfaucon declared him a very uncommon traveller, and confessed his curiosity to know his name; which he no sooner heard, than he rose from his seat, and, embracing him with the utmost ardour, expressed his satisfaction at having seen the man whose productions of various kinds

spirit of this work is not to be commended. Burman's gard, offered not only to procure him an immediate adedition was long afterwards attacked in a separate volume, mission to all the libraries of Paris, but to those in remotwritten by some anonymous author, whose animosity was er provinces, which are not generally open to strangers, and undertook to ease the expenses of his journey by procuring him entertainment in all the monasteries of his order. This favour Burman was hindered from accepting by the necessity of returning to Utrecht, at the usual time of beginning a new course of lectures, to which there was always so great a concourse of students, as much increased the dignity and fame of the university in which he taught."

When his talents and learning had thus procured him a high and well-earned reputation, the death of Perizonius left a vacancy in the professorship of history, the Greek language, and eloquence, in the university of Leyden; and Burman had the honour of being nominated the successor of a man who had occupied a very conspicuous place among the scholars of the age. He was distinguished by the acuteness of his intellect, and the solidity of his judgment: he was equally skilled in Greek and Roman literature, and with his critical skill he united a masterly knowledge of the most abstruse departments of ancient history. Burman, who was no unworthy successor, took possession of his chair on the 2d of July 1715, and then pronounced an inaugural oration, "De publici Humanioris Disciplinæ Professoris proprio Officio et Munere." He was sence of his vituperation. Of the spirit of this effusion the afterwards appointed professor of the history of the United Provinces, and likewise of poetry; and to all these functions was finally added the office of keeper of the university library. He was twice chosen rector of the university, namely, in 1719 and in 1731.

In the midst of these academical toils, which would have been more than sufficient for a person of ordinary application, he still found leisure for the preparation of elaborate editions of Latin classics, and, among the rest, for an edition of Velleius Paterculus. Lugd. Bat. 1719, 8vo. It was reprinted after the death of the editor. Lugd. Bat. 1744, Svo. From this ancient historian he made a tranrence to law as well as history, " De Vectigalibus Populi sition to an ancient rhetorician, and completed an edition of the works of Quintilian. Lugd. Bat. 1720, 3 tom. 4to. The last volume is occupied with the declamations ascribed to that writer, and with those of Calpurnius Flaccus. A pompous edition of Quintilian was afterwards produced "In 1714," says Dr Johnson, "he formed a resolution by Capperonnier (Paris, 1725, fol.); and as Burman thought himself treated with less than due respect, he took an ample revenge in a work entitled "Petri Burmanni Epistola ad Claudium Capperonnerium, Theologum Licentiatum, Diaconum Ambianensem, et Græcæ Linguæ Professorem, de nova ejus M. Fabii Quinctiliani de Institu-tione Oratoria Editione." Leidæ, 1726, 4to. Among other branches of learning, the Parisian professor has betrayed his ignorance of the Roman law, and on this account is severely chastised by his unrelenting adversary. But in the mean time Burman had superintended an edition of Justin, which is without a commentary, but contains an excellent preface. Lugd. Bat. 1722, 12mo.

His editorial labours were next bestowed upon a modern author, whose fame is nearly classical. An elaborate edition of Buchanan had been published by Ruddiman in the year 1715. The value of his annotations was very generally acknowledged, but the narrow and pitiful prejudices of a Jacobite frequently entangled his judgment; and every subject which bore to politics any reference, however remote, was viewed through a dim medium. The political tendency of his preface and notes was so far from being agreeable to the admirers of Buchanan, that a Whig

¹ "In qua voluit errorum graviorum arguere Burmannum, ipse, dum repehendere voluit, gravissime sæpe lapsus, risum præbuit." (Fabricii Bibliotheca Latina, tom. ii. p. 160. edit. Ernesti.)

press purpose of vindicating their favourite author in a new edition of his works. Their efforts however proved abortive, and the task of editorship devolved into more able hands. Arrested by the frequent and wide variation between the author and his jure divino editor, Burman had nearly been induced to relinquish his undertaking, and to advise his printer Langerak to procure assistance from Scotland, where the authenticity of the facts could best be ascertained. Of the new edition projected at Edinburgh he was likewise apprized; though it does not appear, as some writers pretend, that the associated critics made him a voluntary offer of private assistance. The printer however urging him to proceed without waiting for this vindicatory edition, he at length republished the works of Buchanan, together with Ruddiman's preface, notes, dissertation, and other appendages. The annotations which he himself subjoined are almost entirely philological. His other engagements did not permit him to undertake the task of correcting the press; and accordingly his edition is somewhat less accurate than that of his predecessor. The general value of Ruddiman's labours he acknowledges in terms of due respect; but he occasionally rejects his particular opinions in a manner which that learned man was disposed to regard as contemptuous; and some of his expressions relative to British literature, and to the native country of Buchanan, were such as could not easily be forgotten. Two years afterwards, when Ruddiman edited the Latin poems of Dr Pitcairne, he eagerly embraced an opportunity of asserting the honour of his native country; and the same topics were yet fresh in his recollection when he resumed his long labours at the venerable age of eighty-one.

Of the epistolary correspondence of literary men, Burman was a curious and diligent collector. At a much earlier period of his life he had published the epistle of Gudius and other scholars; and he now prepared a more ample and voluminous work, which appeared under the title of " Sylloge Epistolarum a Viris illustribus scriptarum." Leidæ, 1727, 5 tom. 4to. This collection, which forms a great repository of literary anecdote and critical disquisition, is occasionally illustrated with the notes of the editor. In the course of the same year, he completed the printing of a work which holds a very distinguished place among his learned labours, namely, his edition of the works of Ovid. Amst. 1727, 4 tom. 4to. Like several of his other editions of the classics, it contains not merely his own notes, but likewise those of various commentators. Ovid was evidently one of his favourite authors, and he has bestowed much care and attention in the adjustment of the text, as well as in its illustration. With regard to the text, his chief guide is Nicolaus Heinsius, a most able critic in Latin poetry. Burman had formerly published a small edition without a commentary. His next edition, cum notis variorum, was that of the "Poetæ Latini Minores." Leidæ, 1731, 2 tom. 4to. This curious collection was succeeded by an edition, equally elaborate, of the works of Suetonius. Amst. 1736, 2 tom. 4to. After another short interval followed "M. Annæi Lucani Pharsalia, cum commentario Petri Burmanni." Leidæ, 1740, 4to. In the preface to this publication, he speaks of Bentley with some degree of asperity. They were both men of great eminence in classical literature; and although they were both of the same irascible temper, the friendly relations between them had been of long duration. Some suspicions

Burman. association was speedily formed at Edinburgh for the ex- their having each projected an edition of Lucan at a much Burman. earlier period; and the breach had been rendered irreparable, by Burman's decisive measure of subjoining Dr Hare's Epistola Critica to his fourth edition of Phædrus.2

But the labours of this indefatigable scholar were now drawing to a close. His health had originally been vigorous, and those who have the slightest acquaintance with his history must be aware that he was capable of enduring great and continued toil. His temperate mode of living, and his attention to bodily exercise, long contributed to preserve a healthful constitution; but a scorbutic disease, incidental to that climate, having supervened, he found himself unable to take his usual walks, or other recreation, and was at last afflicted with many painful symptoms of a decayed frame and shattered nerves. While he languished in a state of hopeless decay, he had the honour of receiving a letter from Bignon, keeper of the royal library at Paris, accompanying a copy of the printed catalogue, transmitted to him by his majesty's command. This mark of royal favour might possibly cast a faint gleam of earthly comfort on his bed of sickness; but he now required consolation from a higher source, and with a due mixture of fervour and humility he appears to have approached the fountain of living waters. His religious opinions had either been misunderstood or misrepresented; and he felt a commendable solicitude to remove this erroneous impression, by the most unequivocal declaration of his hopes in the mercy of God through the mediation of Jesus Christ. In this devout frame of mind he closed a long and active life, on the 31st day of March 1741, in the seventy-third year of his age.

At the period of his death, he had made great progress in a new edition of Virgil, and it was afterwards completed by his learned nephew, who bore the same name with himself. Amst. 1746, 4 tom. 4to. To the younger Burman we are likewise indebted for the collective edition of his poems, which appeared under the following title: " Petri Burmanni Poematum libri quatuor, nunc primum in lucem editi, curante Petro Burmanno Juniore." Amst. 1746, 4to. His orations were collected by another editor, Nicolaus Bondt: "Petri Burmanni Orationes, antea sparsim editæ, et ineditis auctæ. Accedit Carminum Appendix." Hagæ Comitis, 1759, 4to. Of the Latin language Burman possessed a masterly knowledge, and in verse as well as prose he writes with vivacity and energy; but he is less scrupulous in his diction than some more recent members of the same university, especially Ruhnkenius and Wyttenbach. He is entitled to the praise of a skilful versifier; and his elegiac poems are sufficient to evince that he had, not studied Ovid in vain. His orations, which are eighteen in number, had been delivered on various occasions of academical solemnity, and several of them contain a large infusion of verse. The collection is closed by a funeral oration, written by his colleague, H. Oosterdyk Schacht, from which we have borrowed most of our notices respecting his personal history; but our account of his writings is necessarily derived from other sources. In this enumeration of his posthumous works, it remains to be mentioned that his annotations on Claudian were printed in his nephew's edition of that poet.

The character of Burman is ably and impartially delineated by Dr Johnson. "He was a man of moderate stature, of great strength and activity, which he preserved by temperate diet, without medical exactness, and by allotting proportions of his time to relaxation and amuseand jealousies had however intervened, in consequence of ment, not suffering his studies to exhaust his strength, bu

that omits will find at last that time may be lost, like money, by unseasonable avarice. In his hours of relaxation he was gay, and sometimes gave way so far to his temper, naturally satirical, that he drew upon himself the ill-will of those who had been unfortunately the subjects of his mirth; but enemies so provoked he thought it beneath him to regard or to pacify; for he was fiery, but not malicious, disdained dissimulation, and in his gay or serious hours preserved a settled detestation of falsehood. So that he was an open and undisguised friend or enemy, entirely unacquainted with the artifices of flatterers, but so judicious in the choice of his friends, and so constant in his affections to them, that those with whom he had contracted familiarity in his youth had for the greatest part his confidence in his old age.

" His abilities, which would probably have enabled him to have excelled in any kind of learning, were chiefly employed, as his station required, on polite literature, in which he arrived at very uncommon knowledge, which however appears rather from judicious compilations, than original productions. His style is lively and masculine, but not without harshness and constraint, nor perhaps always polished to that purity which some writers have attained. He was at least instrumental to the instruction of mankind, by the publication of many valuable performances, which lay neglected by the greatest part of the learned world; and, if reputation be estimated by usefulness, he may claim a higher degree in the ranks of learning than some others of happier elocution or more vigorous imagi-

nation."2 Such was the personal and literary character of Burman, as it presented itself to the sagacious observation of this distinguished writer. His name however is less favourably known to the readers of English poetry, where it is repeatedly used to denote whatever is dull and pedantic. Pope, who was not himself a very profound scholar, endeavoured to restore a sort of equilibrium by disparaging the attainments of those who were most conspicuous for their erudition. Bentley is supposed to have excited his spleen by bestowing a too scanty measure of praise on his translation of Homer; nor did the poet neglect any opportunity of directing the edge of his satire against "that awful Aristarch," and those who successfully cultivated similar studies. The following verses occur in the Dunciad, b. iv. v. 235.

> How parts relate to parts, or they to whole, The body's harmony, the beaming soul, Are things which Kuster, Burman, Wasse, shall see When man's whole frame is obvious to a flea.

If to his other qualifications Pope had added one half of the critical learning possessed by Bentley, Kuster, Burman, or Wasse, he would have found himself in a better condition for writing notes on Homer. Mallet, who was anxious to recommend himself to the favour of so great a poet, aimed his shafts in the same direction. His poem Of Verbal Criticism contains the subsequent passage:

Such the choice anecdotes, profound and vain, That store a Bentley's and a Burman's brain: Hence Plato quoted, or the Stagyrite, To prove that flame ascends, and snow is white; Hence much hard study, without sense or breeding, And all the grave impertinence of reading.

Burman. relieving them by frequent intermissions; a practice con-similar vein of sarcasm; nor do we feel much inclination Burman. sistent with the most exemplary diligence, and which he to commend these lines in his Art of Preserving Health, b. iv. v. 52.

> The strong-built pedant, who both night and day Feeds on the coarsest fare the schools bestow, And crudely fattens at gross Burman's stall O'erwhelm'd with phlegm lies in a dropsy drown'd.

The injustice and absurdity of such censures as these it would here be idle to expose. If we admit the value of the ancient classics, we must also admit the expediency of their being rendered intelligible; and how this could have been effected without the intervention of critics and philologers, it would not perhaps be so easy to discover. Bentley, Burman, and many other verbal critics who might be enumerated, were possessed of uncommon talents, as well as erudition; and the ingredients which enter into the formation of an able commentator on the classics, are more rare and more numerous than some individuals may be apt to imagine.

Of the two surviving sons of Burman, the elder, named Francis, made choice of a military life, and obtained promotion in the army. His brother Caspar, who betook himself to the profession of the law, was elevated to the bench, and was elected a deputy to the states general. He was likewise a man of letters, and published several works, which illustrate the civil and literary history of his native country. " Analecta Historica de Hadriano VI. Pontifice Maximo." Traj. ad Rhen. 1727, 4to. "Trajectum eruditum, Virorum Doctrina inlustrium, qui in Urbe Trajectina, et Regione Trajectensi nati sunt, sive ibi habitarunt, Vitas, Fata, et Scripta exhibens." Traj. ad Rhen. 1738, 4to. He is also the author of a work in the Dutch language, published in 1750-1 under the title of Utrechte Jaarboeken, and extending to three volumes. He died on the 22d of August 1755.

His grandfather Francis Burman, who has already been mentioned as professor of divinity at Utrecht, published various works on theology.3 He was born at Leyden in 1632, and died at Utrecht in 1679. His son Francis was born at Utrecht in 1671, became professor of divinity in that university in 1715, and died in 1718. He was the author of different works, written in the Latin and Dutch languages. His son John Burman, M.D. was born in 1707, was appointed professor of botany at Amsterdam, and died in 1780. He evinced much zeal in his own branch of science, and published several works on botany. Nicolas Laurens Burman, M. D. his son, and his successor in the botanical chair, was born in 1734, and died in 1793, after having produced some works in his own department. Francis Burman, the brother of John, was the third individual of the same name and family who held the professorship of divinity at Utrecht.4

But a more conspicuous member of the same remarkable family, was his other brother Peter Burman. On the 13th of October 1714 he was born at Amsterdam, where his father was then a minister. When only four years of age he lost his father, and the care of his education devolved upon his uncle, who communicated to him his own ardent love of classical learning. His academical studies he completed at Utrecht, where in 1734 he took the degree of doctor of laws, having previously written and defended a dissertation De Jure Annulorum aureorum, which has been thought worthy of being reprinted in the collection Dr Armstrong, a contemporary poet, has indulged in a of Oelrichs.⁵ In 1736 he was nominated professor of elo-

Burnet.

Burman. quence and history in the university of Francker, in the room of Wesseling, who had been removed to Utrecht. The chair of poetry was in 1741 added to his other appointments; but in the course of the following year he accepted of an invitation to the Athenæum of Amsterdam, where he became professor of history, eloquence, the Greek language, and poetry, keeper of the public library, and visitor of the Latin schools. In his literary character he bore a considerable resemblance to his more celebrated uncle, and was evidently a man of extensive learning.1 He published several detached orations, and other tracts, and an ample collection of his Latin poems. " Petri Burmanni Secundi Poematum libri quatuor." Lugd. Bat. 1774, 4to. "Carminum Appendix." Lugd. Bat. 1779, 4to. He edited several of the classics on a plan similar to that commonly adopted by his uncle. We have already mentioned the edition of Virgil, completed by his learned labour, and must now continue the enumeration of his classical publications. "Anthologia veterum Latinorum Epigrammatum et Poematum, sive Catalecta Poetarum Latinorum." Amst. 1759-73, 2 tom. 4to. "Aristophanis Comædiæ undecim Græce et Latine." Lugd. Bat. 1760, 2 tom. 4to. "Claudii Claudiani Opera." Amst. 1760, 4to. "Ciceronis (vel incerti auctoris) Rhetoricorum ad Herennium libri quatuor, et de Inventione libri duo." Lugd. Bat. 1761, 8vo. "Propertii Elegiarum libri IV." Traj. ad Rhen. 1780, 4to. This last work, which he did not himself bring to a conclusion with the did not himself bring to a conclusion. self bring to a conclusion, was conducted through the press by Van Santen, an elegant and correct scholar, who, under the name of Santenius, is well known to those who are acquainted with the literary history of that age. At an the same elaborate and splendid manner. "Petri Lotichii Secundi Opera omnia." Amst. 1754, 2 tom. 4to. He likewise undertook the task of editing the works of some modern critics. "Henrici Valesii Emendationum libri V. et de Critica libri duo," &c. Amst. 1740, 4to. "Nicolai Heinsii Adversariorum libri IV." &c. Harlingæ, 1742, 4to. Of his personal history, a few particulars remain to be told. He was thrice married. About a year before his death, he resigned his professorship, and having received a liberal pension from the curators of the Athenæum, he retired to his villa at Santhorst, in the hope of long enjoying literary repose; but having been struck with apoplexy, he expired on the 24th of June 1778. He appears to have been a person of a disposition sufficiently irritable: he was from time to time involved in various strifes and contentions; and his quarrels with a Dutch and a German professor, Saxius and Klotz, gave occasion to many invectives in the Latin, Dutch, and German languages.2 According to the testimony of his adversaries, he was not remarkable for his sobriety. To this alleged failing Klotz alludes in the following ludicrous verses, written in the character of the schoolmaster of Santhorst.

> O cœlum! noster dominus, Petrus Burmannus Secundus, Est mortuus, ut unus mus. Quid nos incipiamus? Cum quo nos nunc bibamus, Ni Petrum nostrum dominum, ni Petrum habeamus?

> > Habebat multos cyathos, Habebat scyphos vitreos. Et calices argenteos.

Sic est, sic omnia sunt vana, Sic vita aufugit humana, Discessit noster dominus, disrumpitur ut rana.

> Ille bibebat fortiter, Et tonans terribiliter, Exhauriebat bis et ter Unam magnam lagenam, Quam dicebat Hippocrenam,

Nunc dedit noster dominus, nunc dedit morti pænam.

Although it certainly is not safe to take any person's character from his enemies, yet even by his enemies a very sober man will not often be accused of intemperance. (D. I.)

BURNET, Thomas, a distinguished writer, was born at Croft in Yorkshire about the year 1635, but is supposed to have been descended of a Scottish family. His early education he received at the free-school of Northallerton, in the same county, under Thomas Smelt, who used to propose him as an example to the rest of his scholars. On the 26th of June 1651, he was admitted a pensioner of Clare Hall at Cambridge, under the tuition of Tillotson, who continued to remember him with kindness; but in the year 1654, he removed to Christ's College, on the election of Dr Cudworth to the mastership, and there he obtained a fellowship in the year 1657. In 1661 he became senior proctor of the university. He was successively domestic tutor to Charles duke of Bolton, and to James earl of Ossory, afterwards duke of Ormonde, grandson to the first duke; and by the interest of the latter nobleman he was chosen master of the Charter-house in 1685. Among the electors, some of the bishops opposed him on account of his wearing a lay-habit; but the duke was satisearlier period, Burman had published a modern poet in fied that he possessed the more essential qualifications of a life and conversation suitable to his clerical character. After this appointment, he took the degree of D.D. In his capacity of master, he made a noble stand against the admission of a papist named Andrew Popham, as a pensioner of the house: on the 26th of December 1686, the king addressed to the governors a letter dispensing with the statutes; but the opposition of the master being vigorously supported by other governors, James deemed it prudent to desist from this illegal attempt.

Dr Burnet had already published his *Telluris Theoria* sacra. Lond. 1681, 4to. This work attracted an unusual share of the public attention, and he was afterwards encouraged to exhibit it in an English dress. His Sacred Theory of the Earth was printed in folio, the first part in 1684, and the conclusion in 1689. Addison commended the author in a Latin ode. His fanciful theory was however attacked by Dr Keill, Mr Whiston, and Mr Warren, to all of whom he returned an answer. He had now acquired a high reputation as a man of talents; and after the revolution, he was introduced at court by Archbishop Tillotson, whom he succeeded as clerk of the closet to King William.4 He seemed already to be on the direct road to much higher preferment, when he suddenly marred his own prospects by the publication of a learned and ingenious work, entitled Archæologiæ Philosophicæ: sive Doctrina antiqua de Rerum Originibus. Lond. 1692, 4to. The mode in which he discussed the history of the fall of man, excited a great clamour against him; and the king was obliged to remove him from his office at court. Of this book an English translation was executed by Mr Foxton. Lond. 1729, 8vo. Dr Burnet next published

¹ "Habebat enim cum ipse maximam doctrinæ copiam, tum vero litteratam supellectilem ex libris virorum doctorum ineditis tantam quantam privatorum quidem hominum haud scio an nemo unquam habuerit." (Wyttenbachii Opuscula, tom. i. p. 136. Lugd. Bat. 1821, 2 tom. 8vo.)

Burnet. "Remarks upon an Essay concerning Human Understanding, in a Letter address'd to the Author." Lond. 1697, 4to. "Second Remarks, &c. being a Vindication of the first Remarks against the Answer of Mr Locke, at the end of his Reply to the Lord Bishop of Worcester." Lond. 1697, 4to. "Third Remarks," &c. Lond. 1699, 4to. These remarks were answered by Catherine Trotter, afterwards Mrs Cockburn, in her "Defence of Mr Locke's Essay," written when she was twenty-three years of age, and printed at London in 1702. He died at the Charterhouse on the 27th of September 1715, at a very advanced age. Two of his works were published several years after his death. De Fide et Officiis Christianorum Liber posthumus. Lond. 1722, 4to. De Statu Mortuorum et Rewas published by Dr Teller of Berlin. Halæ Magdeburg. 1786, 8vo. The second has likewise been more than once reprinted; and two English translations were published by Matthias Earbery and John Dennis. The author was evidently a man of genius and learning; but his fancy being sometimes more vigorous than his judgment, he is maintains the doctrine of the middle state, the Millennium, and the limited duration of future punishment. Muratori, an Italian writer of great eminence, published copious animadversions upon it, under the subsequent title: "De Paradiso Regnique Cælestis Gloria, non expectata Corporum Resurrectione, Justis a Deo conlata; adversus Thomæ Burneti Britanni Librum de Statu Mortuorum." Veronæ, 1738. 4to. The name of Burnet appears in the following publication, but his only contribution consists of a few pages translated from his treatise on the faith and duties of Christians: "The Judgment of Dr Thomas Burnet, late Master of the Charter-House, concerning the Doctrine of the Trinity: and the Judgment of Dr Samuel Clarke, late Rector of St James's, concerning 1. the Satisfaction, 2. the Merits, 3. the Mediation and Intercession of Christ, 4. the ordinary Influence and Assistance of the Holy Spirit, 5. the two Sacraments. With a preface concerning Mr Lock, Sir Isaac Newton, and Mr Wollaston." Lond. 1732, 8vo. (D. I.)

BURNET, Gilbert, bishop of Salisbury, was born at Edinburgh in 1643, but was descended of an ancient family in the county of Aberdeen. His father being bred to the law, was, at the restoration of King Charles II., appointed one of the lords of session, by the title of Lord Crimond, as a reward for his constant attachment to the royal party during the civil wars. Gilbert, the youngest son of his father, was instructed by him in the Latin tongue; and at ten years of age he was sent to Marischal College, Aberdeen, where he was admitted A. M. before he was fourteen years of age. His own inclination led him to the study of the civil and feudal law; and he used to say that it was from this study he had received more just notions concerning the foundations of civil society and government, than those which some divines maintain. He afterwards changed his views, and, to the great satisfaction of his father, began to apply to divinity. He received ordination before the age of eighteen; and Sir Alexander Burnet, his cousin-german, offered him a benefice, but he refused to accept of it.

In 1663, about two years after the death of his father, he came into England; and after six months stay at Oxford and Cambridge, returned to Scotland; which he soon left again to make a tour of some months, in 1664, in Hol-

rabbi, he perfected himself in the Hebrew language; and Burnet. likewise became acquainted with the leading men of the different persuasions tolerated in that country, Calvinists, Arminians, Lutherans, Anabaptists, Brownists, Papists, and Unitarians; among each of which sects he used frequently to declare he met with men of such unfeigned piety and virtue, that he became fixed in a strong principle of universal charity, and an invincible abhorrence of all severities on account of religious dissensions.

Upon his return from his travels, he was admitted minister of Saltoun; in which station he served five years in the most exemplary manner. He drew up a memorial, in which he took notice of the principal errors in the conduct of the Scottish bishops, which he observed not to be consurgentium Tractatus. Lond. 1723, 4to. Of the first of formable to the primitive institution; and sent a copy of these works, there are several other editions, one of which it to several of them. This exposed him to their resentments; but to show he was not actuated by a spirit of ambition, he led a retired course of life for two years, which so endangered his health that he was obliged to abate his excessive application to study. In the year 1668 he was appointed professor of divinity in the university of Glasgow; and, according to the usual practice, he read his not on all occasions a very safe guide. In this work he lectures in the Latin language. It was apparently at this period that he laid the chief foundation of that theological learning for which he became so distinguished. In 1669 he published his "Modest and free Conference between a Conformist and Nonconformist." He became acquainted with the Duchess of Hamilton, who communicated to him all the papers belonging to her father and her uncle; upon which he drew up the "Memoirs of the Dukes of Hamilton," afterwards printed at London, in folio, in the year 1677. The Duke of Lauderdale, hearing he was engaged in this work, invited him to London, and introduced him to King Charles II. He returned to Scotland, and married Lady Margaret Kennedy, daughter of the Earl of Cassillis, a lady of great knowledge, and highly esteemed by the Presbyterians, to whose sentiments she was strongly inclined.1 As there was some disparity in their ages, that it might be sufficiently evident that this match was wholly owing to inclination, and not to avarice or ambition, the day before their marriage he delivered to the lady a deed, by which he renounced all pretensions to her fortune, which was very considerable, and must otherwise have fallen into his hands, she herself having no intention to secure it. His "Vindication of the Authority, Constitution, and Laws of the Church and State of Scotland,' printed at Glasgow, in octavo, in the year 1673. This was considered as so material a service to the government, that he was again offered a bishopric, with a promise of the next vacant archbishopric; but he did not accept of it, because he could not approve of the measures of the court, the great view of which he perceived to be the advancement of popery. The publication itself was one of those which the author could not afterwards recollect with much satisfaction.

His intimacy with the Dukes of Hamilton and Lauderdale procured him frequent messages from the king and the Duke of York, who had conversations with him in private. But Lauderdale, who was the most unprincipled man of the age, conceiving a resentment against him on account of the freedom with which he spoke to him, represented at last to the king that Dr Burnet was engaged in an opposition to his measures; and on his return to London he perceived that these suggestions had entirely deprived him of the king's favour, though the Duke of York treated him with greater civility than ever, and dissuaded him land and France. At Amsterdam, by the help of a Jewish from going to Scotland. He accordingly resigned his pro-

I Some degree of attention has lately been directed to this lady in consequence of the publication of a collection of Letters from Lady Margaret Burnet to John Duke of Lauderdale. Edinb. 1828, 4to.

time the living of Cripplegate being vacant, the dean and chapter of St Paul's (in whose gift it was), hearing of his circumstances, and the hardships which he had undergone, made him an offer of the benefice; but, as he had been informed of their first intention of conferring it on Dr Fowler, he generously declined it. In 1675, at the recommendation of Lord Hollis, whom he had known in France as ambassador at that court, he was by Sir Harbottle Grimstone, master of the rolls, appointed preacher at the Rolls chapel, notwithstanding the opposition of the court; and he was soon afterwards chosen lecturer at St Clement's, and became one of the most popular preachers in town. The first volume of his History of the Reformation of the Church of England was published in folio in 1681, the second in 1683, and the third in 1715. For this great work he received the thanks of both houses of parliament. Of the first two volumes he published an abridgment in the year

Dr Burnet about this time happened to be sent for to a woman in sickness, who had been engaged in an amour with the Earl of Rochester. The manner in which he treated her during her illness gave that profligate nobleman a great curiosity for being acquainted with him; and during a whole winter, he spent one evening of the week with Dr Burnet, who discussed with him all those topics upon which sceptics and men of loose morals attack the Christian religion. The happy effects of these conferences occasioned the publication of his account of the life and death of that nobleman. In 1682, when the administration was changed in favour of the Duke of York, being much resorted to by persons of all ranks and parties, in order to avoid returning visits, he built a laboratory, and for above a year pursued a course of chemical experiments. Not long after he refused a living of three hundred pounds a year offered him by the Earl of Essex, on the terms of his not residing there, but in London. When the enquiry concerning the popish plot was on foot, he was frequently sent for and consulted by King Charles with relation to the state of the nation. His majesty offered him the bishopric of Chichester, then vacant, if he would engage in his interests; but he refused to accept it on these terms. He preached at the Rolls till 1684, when he was dismissed by order of the court.

About this period he published various works, among sich we must not overlook the following seven. "Some which we must not overlook the following seven. Passages of the Life and Death of John Earl of Rochester."1 Lond. 1680, 8vo. "The Life and Death of Sir Matthew Hale, Kt. sometime Lord Chief Justice of his Majesties Court of Kings Bench." Lond. 1682, 8vo. "The History of the Rights of Princes in disposing of Ecclesiastical Benefices and Church Lands." Lond. 1682, 8vo. "The Life of William Bedell, D. D. Bishop of Kilmore in Ireland." Lond. 1685, 8vo. "Reflexions on Mr Varillas's History of the Revolutions that have happened in Europe in matters of Religion, and more particularly on his ninth book, that relates to England." Amst. 1686, 12mo. "A Defence of the Reflections on the ninth book of the first volum of Mr Varillas's History of Heresies; being a Reply to his Answer." Amst. 1687, 12mo. "A Continuation of Reflections on Mr Varillas's History of Heresies, particularly on that which relates to English Affairs in his third and fourth tomes." Amst. 1687, 12mo. He bore a very conspicuous part in the controversy which

Burnet. fessorship at Glasgow, and settled in London. About this a complete catalogue of his works would occupy no small Burnet. The following translations deserve to be mentioned in this very brief and inadequate notice. "Utopia, written in Latin by Sir Thomas More, Chancellor of England: translated into English." Lond. 1685, 8vo. "A Relation of the Death of the primitive Persecutors, written originally in Latin by L. C. F. Lactantius: Englished by Gilbert Burnet, D.D. to which he hath made a large preface concerning persecution." Amst. 1687, 12mo.

On King James's accession to the throne, having obtained leave to quit the kingdom, he first went to Paris, and lived in great retirement, till, contracting an acquaintance with Brigadier Stouppe, a Protestant gentleman in the French service, he made a tour with him into Italy. He met with an agreeable reception at Rome. Pope Innocent XI. hearing of his arrival, sent the captain of the Swiss guards to acquaint him he would give him a private audience in bed, to avoid the ceremony of kissing his holiness's slipper; but Dr Burnet excused himself as well as he could. Here, with more zeal than prudence, he engaged in some religious disputes; and, on receiving an intimation from Prince Borghese, he found it necessary to withdraw from this stronghold of priestcraft, and pursued his travels through Switzerland and Germany. He afterwards came to Utrecht, with an intention to settle in some of the seven provinces. There he received an invitation from the prince and princess of Orange (to whom their party in England had recommended him) to come to the Hague, and of this invitation he accepted. He was soon acquainted with the secret of their councils, and advised the preparation of a fleet in Holland sufficient to support their designs and encourage their friends. This, and the account of his travels,2 in which he endeavoured to blend popery and tyranny together, and represent them as inseparable, with some papers reflecting on the proceedings of England, that came out in single sheets, and were dispersed in several parts of England, of most of which Dr Burnet owned himself the author, alarmed King James, and were the occasion of his writing twice against him to the princess of Orange, and insisting, by his ambassador, on his being forbidden the court; which, after much importunity, was done, though he continued to be trusted and employed as before, the Dutch minister daily consulting him. To put an end to these frequent conferences with the ministers, a prosecution for high treason was commenced against him both in England and Scotland; but receiving the intelligence before it reached the states, he avoided the storm, by petitioning for, and obtaining without any difficulty, a bill of naturalization, in order to his intended marriage with Mary Scott, a Dutch lady of considerable fortune, who, with the advantage of birth, united those of a fine person and understanding.

After his marriage with this lady, being legally under the protection of Holland, when Dr Burnet found King James plainly subverting the constitution, he omitted no method to support and promote the design which the prince of Orange had formed of delivering Great Britain; and, having accompanied him in quality of chaplain, he was in the year 1689 advanced to the see of Salisbury. He declared for moderate measures with regard to the clergy who scrupled to take the oaths, and many were displeased with him for declaring for the toleration of nonconformists. As my lord of Salisbury, says the Earl of Shaftesbury, at that time was so ably maintained against the papists; and "has done more than any man living for the good and

t "Which," says Dr Johnson, "the critick ought to read for its elegance, the philosopher for its arguments, and the saint for its piety," (Lives of English Poets, vol. i. p. 303.)

Gurnet. honour of the church of England and the reform'd reli- the least conspicuous part of his character: the church of Burnet gion, so he now suffers more than any man from the tongues and slander of those ungrateful church-men; who tion, having no claim to that of Christianity or Protestant, since they have thrown off all the temper of the former, and all concern or interest with the latter." The same noble writer has elsewhere mentioned him in the following terms lege of justice, was born about the year 1714. He was of commendation: "The bishop of Salisbury's Exposition of the Articles is, no doubt, highly worthy of your study. None can better explain the sense of the church, than one who is the greatest pillar of it since the first founders; one who best explain'd and asserted the reformation its self; was chiefly instrumental in saving it from popery before and at the Revolution; and is now the truest example of laborious, primitive, pious, and learned episcopacy."

and supremacy to King William and Queen Mary, 1689, happening to touch upon the right of conquest, gave such offence to both houses of parliament, that it was ordered to be burnt by the hands of the common executioner. He soon afterwards published a very valuable work, entitled A Discourse of the Pastoral Cure. Lond. 1692, 4to. In 1698 he lost his wife by the small-pox; and as he was almost immediately after appointed preceptor to the Duke of Gloucester, of whose education he took great care, this employment, and the tender age of his children, induced him the same year to supply her loss by a marriage with Mrs Berkeley, a widow, who was eldest daughter of Sir Richard Blake. In 1699 he published his Exposition of the thirty-nine Articles; which occasioned a representation against him in the lower house of convocation in the year 1701, but he was vindicated in the upper house. His speech in the House of Lords in 1704 against the bill to prevent occasional conformity, was severely attacked. He formed a scheme for augmenting the small livings; which he pressed forward with such success, that it ended in an act of parliament passed in the second year of Queen Anne, for the augmentation of the livings of the poor clergy. He died in 1715, and was interred in the church of St James, Clerkenwell, where a monument was erected to his memory.

Bishop Burnet's History of his own Time, consisting of two large volumes in folio, was not published till several years after the author's death; the first volume appeared in 1724, and the second in 1734. An account of his life was added by his youngest son Sir Thomas Burnet, one of the judges of the court of common pleas. The history itself was not printed without mutilations; but after an interval of nearly a century, an edition, containing all the passages which had formerly been suppressed, was published under the superintendence of the learned Dr Routh. Oxford, 1823, 6 vols. 8vo. This is a work of great and intrinsic value: it exhibits many curious and interesting delineations of character, and many striking views of the causes and progress of events. The first volume, which relates to the reigns of Charles II. and his brother James, we consider as the more interesting of the two. His materials are not always very carefully digested, and his style is sometimes supposed to be too familiar; but these defects are abundantly compensated by the copiousness of his information, the benevolence of his sentiments, and the earnestness of his manner. The Conclusion displays superior dignity of composition, and cannot be perused without the most favourable impression of the author's intellectual attainments and moral worth. He uniformly evinces his attachment to the cause of freedom, nor is this

England, in its collective capacity, has always been hostile to civil as well as religious liberty; and its annals exmay well call themselves by that single term of distinc- hibit very few names which tend to remove the general stigma. Those of Burnet and Hoadley ought never to be forgotten.

BURNET, James, Lord Monboddo, a senator of the colthe son of Mr Burnet of Monboddo in Kincardineshire. After passing through the usual course of school education, he prosecuted his studies at the universities of Aberdeen, Edinburgh, and Leyden, with distinguished reputation. He was admitted an advocate in 1737; and on the 12th of February 1767, he was raised to the bench by the title of Lord Monboddo.

A journey to London became a favourite amusement of His pastoral letter concerning the oaths of allegiance his periods of vacation from the business, of the court; and for a time he made this journey once a year. A carriage, a vehicle that was not in common use among the ancients, he considered as an engine of effeminacy and sloth, which it was disgraceful for a man to make use of in travelling. To be dragged at the tail of a horse, instead of mounting upon his back, seemed, in his eyes, to be a truly ludicrous degradation of the genuine dignity of human nature: in all his journeys, therefore, between Edinburgh and London, he was wont to ride on horseback, with a single servant attending him. He continued this practice, without finding it too fatiguing for his strength, till he was upwards of eighty years of age.

Lord Monboddo is well known to the world as a man of letters. His first publication was The Origin and Progress of Language, in two vols. 8vo, 1773, which were followed by four more volumes, the last being published not long before his death. In this work, intended chiefly to vindicate the honour of Grecian literature, he ascribes the origin of alphabetical writing to the Egyptians; and strenuously maintains that the orang-utan is a variety of the human species, and that his want of speech is merely accidental. He also endeavours to establish the reality of the existence of mermaids, and other fictitious animals. He was induced to undertake another work for the purpose of defending the cause of Grecian philosophy, and published, in five vols. 4to, a work entitled Ancient Metaphysics, which, like the other, is remarkable for a surprising mixture of erudition and genius, with the most absurd whim and conceit.

As a judge his decisions were sound, upright, and learned, marked with acute discrimination, and free from those paradoxes and partialities which appear in his writings. He attended his judicial duty with indefatigable diligence till within a few days of his death, which happened at his house in Edinburgh on the 26th of May 1799, at the advanced age of eighty-five.

BURNEY, CHARLES, Doctor of Music, was born in the ancient city of Shrewsbury, the capital of Shropshire, on the 7th of April 1726. He received his earlier education at the excellent free school of that city, and was afterwards sent to the public school at Chester. His first musicmaster was Mr Baker, organist of Chester Cathedral, and a pupil of Dr John Blow. Returning to Shrewsbury when about fifteen years old, he continued his musical studies for three years under his half-brother, Mr James Burney, organist of St Mary's Church; and was then sent to London as a pupil of the celebrated Dr Arne, with whom he remained three years. In 1749 he was appointed organist of a church in the city, with a salary of L.30 ayear; and was also engaged as conductor of a concert esta-

Burney. blished at the King's Arms, Cornhill. In that year and the next, he composed the music of three dramas for Drury Lane theatre—Alfred, Robin Hood, and Queen Mab. His health now became so seriously affected, that his physicians advised him to retire into the country; and he therefore went to Lynn, in Norfolk, where he was elected organist, with an annual salary of L.100, and where he resided for the next nine years. During that time he began to entertain the idea of writing a general history of music. In 1760 he returned to London in good health, and with a young family; the eldest of whom, a girl of eight years of age, surprised the public by her attainments as a harpsichordplayer. In 1766 he produced, at Drury Lane, a free English version and adaptation of J. J. Rousseau's operetta Le Devin du Village, under the title of The Cunning Man, which was favourably received. The university of Oxford conferred upon him, on 23d June 1769, the degrees of bachelor and doctor of music, on which occasion he presided at the performance of his exercise for these degrees. His exercise consisted of an anthem, with an overture, solos, recitatives, and choruses, accompanied by instruments, besides a vocal anthem in eight parts,1 which was not performed for the reason mentioned by Burney.2 His friend, C. P. E. Bach, requested a copy of this exercise, and had it performed in St Catharine's Church at Hamburg, under his own direction, in 1773. It was repeatedly performed at Oxford, "after it had fulfilled its original destination," as Burney tells us (vol. iii. p. 329); and he apologises as follows for saying so much about it. "It is hoped that the reader will pardon this egotism, which has been extorted from me by occasional and sinister assertions, 'that I neither liked nor had studied church music.'" (Ibid.) In 1769 he published An Essay towards a History of Comets.

> Amidst his various professional avocations, Burney never lost sight of his favourite object-his History of Musicand therefore resolved to travel abroad for the purpose of collecting materials that could not be found in Great Britain. Accordingly he left London in June 1770, furnished with numerous letters of introduction, and proceeded to Paris, and thence to Geneva, Turin, &c. The results of his observations he published in The present state of Music in France and Italy, 1 vol. 8vo, London, 1771. Dr Johnson thought so well of this work, that, alluding to his own Journey to the Western Islands of Scotland," he said, "I had that clever dog Burney's Musical Tour in my eye." In 1771 Burney published a translation of Tartini's Letter to Signora Lombardini on Violin-playing. In July 1772 Burney again visited the Continent, to collect further materials; and, after his return to London, published his tour under the title of The present state of Music in Germany, the Netherlands, and United Provinces, 2 vols. 8vo, London, 1773. In the latter year, he was chosen a Fellow of the Royal Society of London. In 1776 appeared the first volume (in 4to) of his long-projected History of Music; in 1782 the second volume; and in 1789 the third and fourth. His Tour in Germany, &c., and the first volume of his History, were sharply criticised by J. N. Forkel, music-director at

Göttingen, in the third volume of his Musikalisch-Kritische Burney. Bibliothek, Gotha, 1779. The Spanish ex-Jesuit, Requeno, in his Italian work Saggj sul Ristabilimento dell' Arte Armonica de' Greci e Romani Cantori, Parma, 1798, 2 vols. 8vo, attacks Burney's account of the ancient Greek music, and calls him lo scompigliato Burney.4 Burney's first tour was translated into German by Ebeling, and printed at Hamburg in 1772; and his second Tour, translated into German by Bode, was published at Hamburg in 1773. A Dutch translation of his second Tour, with Notes, by J. W. Lustig, organist at Gröningen, was published there in 1786. The Dissertation on the music of the ancients, in the first volume of Burney's History, was translated into German by J. J. Eschenburg, and printed at Leipzig, 1781. In the same year that Burney published the first volume of his History of Music, appeared Sir John Hawkins' General History of the Science and Practice of Music, in 5 vols. 4to; but, although Hawkins' work had certain merits, the superior elegance and animation of Burney's style secured the favour of the public; and Hawkins' volumes have always been rather consulted by musical antiquaries, than read for instruction and amusement by professional musicians or amateurs. The Indices appended to Burney's History are so incomplete as to give great trouble in consulting his volumes. This is a serious defect in so large a work. From the two first volumes of Padre Martini's very learned Storia della Musica, Bologna, 1757-1770, Burney derived much aid.5 At the end of the fourth volume of his History of Music, Burney says: "I have at length arrived at the end of a work that has been thirty years in meditation, and more than twenty in writing and printing" (page 684). One cannot but admire Burney's persevering industry, and sacrifices of time, money, and personal comfort, in collecting and preparing materials for his History; and few will be disposed to condemn, too severely, errors and oversights in a work of such extent and difficulty. Dr T. Bushy's History of Music (2 vols. 8vo, 1819), is a mere abridgment of Burney and Hawkins, written in a bombastic style. In 1779 he wrote, for the Royal Society, an account of the infant Crotch,7 whose remarkable musical talent excited so much attention at that time. In 1783, through the treasury influence of his friend Edmund Burke, he was appointed organist to the chapel of Chelsea Hospital, and removing thither with his family, resided there for the remainder of his days. In 1784 Burney published, with an Italian title-page, the music annually performed in the Pope's chapel at Rome during Passion week; a work which A. Choron republished at Paris in 1818. In 1785 he published, for the benefit of the Musical Fund, an account of the first commemoration of Handel in Westminster Abbey in the preceding year, with an excellent life of Handel, 1 vol. 4to. J. J. Eschenburg published a German translation of this at Berlin in 1785. In 1796 he published Memoirs and Letters of Metastasio, 3 vols. 8vo. Towards the close of his life, Burney contributed to the Rev. Dr Rees's Cyclopædia all the musical articles not belonging to Natural Philosophy and Mathematics. For these articles he received L.1000; which seems a remarkable remunera-

¹ In the third volume of his General History of Music, pp. 251-3, Burney gives a copy of this anthem.
2 Dr William Hays, then music professor at Oxford, told Burney that "this movement alone would have well entitled him to a doc-

tor's degree." Ib. p. 329.

3 Forkel published two volumes of a general history of music, Allgemeine Geschichte der Musik, Leipzig, 1788-1801, in 4to. His second
These volumes are very accurate and learned, but volume comes down to the time of the Italian professor, F. Gafori, who died in 1522. These volumes are very accurate and learned, but heavily written. Forkel died in 1818, aged 69. 4 Ibid. Prefazione, p. 24.

The third volume of Martini's Storia was published in 1781, concluding the history of ancient Greek music. The rest of that work remains in MSS. in the library of the Liceo at Bologna; and will probably never be published, as the writer of this article was told in 1819 by the librarian, Signor Barbieri; the cost of printing being greater than the sale would cover. Signor Barbieri confirmed Burney's estimate of the number of books in Padre Martini's library (now in the Liceo), i. e. 17,000.

Burney. tion, considering that most of his materials were merely transcribed from his own History of Music. He was made a member of the Institute of France, and nominated a correspondent in the class of the Fine Arts, in the year 1810.1 He died at Chelsea College on the 12th of April 1814,2 and was interred in the burying-ground of the college on the 20th of the same month. His funeral was attended by many persons of rank and talent. Burney had a wide circle of acquaintance among the distinguished artists and literary men of his day.3 At one time he thought of writing a life of his friend Dr Samuel Johnson; but retired before the crowd of biographers who rushed into that field. His character in private as well as public life, appears to have been very amiable and exemplary. Signor Serafino Lanzoni of Florence-a school-fellow and intimate friend of Cherubini, and who had long resided in London as a protessional musician-told the writer of this article in 1818, that he had frequently met with Dr Burney at musical parties, and spoke highly of him as a man of pleasing and gentlemanly manners; but said that he was too fond of taking a part in singing, upon every occasion, for which he was not fitted by either ear or voice; adding, Stuonava da far crepare i sassi! But, like hundreds more, Burney may have been a very good player on the organ and harpsichord, without having a fine ear, or being able to sing in tune. Dr Burney's sons and daughters were all persons of talent. His eldest son, James, was a distinguished officer in the royal navy, and died a rear-admiral in 1821. He published several works of merit. Dr Burney's second son, the Rev. Charles Burney, D.D., was an eminent Greek scholar; and his second daughter, afterwards Madame D'Arblay, was a very successful novelist in her early life. Her Diary and Letters, already referred to, contain many minute and interesting particulars of her father's public and private life, and of his friends and contemporaries.

Besides the operatic music above mentioned, Burney's known compositions consist of, 1. Six Sonatas for the harpsichord; 2. Two Sonatas for the harp or piano, with accompaniments for violin and violoncello; 3. Sonatas for two violins and a bass: two sets; 4. Six Lessons for the harpsichord; 5. Six duets for two German flutes; 6. Three concertos for the harpsichord; 7. Six concert pieces with an introduction and fugue for the organ; 8. Six Concertos for the violin, &c., in eight parts; 9. Two Sonatas for pianoforte, violin, and violoncello; 10. A Cantata, &c.; 11. Anthems, &c.; 12. XII. Canzonetti a due voci in Canone, pæsia dell' Abate Metastasio. (G. F. G.)

BURNEY, Charles, son of the historian of music, and an eminent classical scholar, was born at Lynn in Norfolk in 1757. At the age of eleven he was sent to the Charterhouse in London, whence he removed to Caius college, Cambridge. He quitted this university without taking his degree; but in 1791 he received the diploma of LL.D. from Aberdeen, and in 1808 that of D.D. from Cambridge. In 1783 he married the daughter of Dr Rose the translator of Sallust, and continued for some time to assist his father-inlaw in the management of his academy. He contributed at this time many articles to the Monthly Review, and afterwards edited for two or three years the London Magazine. Some of his contributions to the first of these periodicals gained him much credit not only among English but Continental scholars. His reputation was now so thoroughly established, that in the course of a short time he realized a handsome fortune, much of which he expended in the formation of his splendid library. The manuscripts and rare books which he collected were considered so valuable that at his death, which happened in 1817, they were purchased by the nation and deposited in the British-Museum.

Burney, Frances, a popular novelist of the last century, was the eldest daughter of the historian of music, and was

born at Lynn in Norfolk in 1752. In the ninth year of Burning. her age she accompanied her father to London, where, from the advantages of her position, she enjoyed excellent opportunities of observing the manners and characters of all classes of society. As soon as she could use the pen, which however was not very early, she began to write little stories for her own amusement and that of her sisters, but her stepmother (for Dr Burney's second marriage took place when Frances was in her sixteenth year) remonstrating against so dangerous a recreation, she abandoned it for a time. But the literary impulse was too strong to be permanently suppressed, and, in 1778, when Miss Burney was in her twenty-sixth year, Evelina appeared. No novel since the days of Smollett had produced so great an effect on the public mind, or gained for its author so wide and rapid a popularity. Four years after appeared Cecilia, which amply sustained Miss Burney's reputation, and instantly took rank as an English classic. In 1785 she became one of the keepers of the robes to Queen Charlotte the consort of George III., a situation which she held for five years, and which gave her ample opportunities of observing and studying the manners of the court, and witnessing many of the historical incidents of the period. These she has recorded in her "Diary." In 1793 she married M. D'Arblay, an exiled officer of French cavalry. Three years later she published her third novel, Camilla, for which it is said that she received no less a sum than 3000 guineas. It is generally agreed that this work, though equal to its predecessors in humour and portraiture of character, is inferior to them in grace and purity of style. In 1803 she went over to Paris to join her husband, and did not again see her native country for ten years. In 1813 she returned in time to witness the demise of her father, who died in that year at the age of eighty-seven. In the following year she published her last novel, the Wanderer, a work which speedily and justly fell into oblivion. In 1832 she published her memoirs of her father, and in 1840 she died, in the eighty-eighth year of her age.

BURNING, the action of fire on some pabulum or fuel. Burning of the Dead, a custom much practised by the ancient Greeks and Romans, and still retained by several nations in the East Indics. The antiquity of this custom reaches as high as the Theban war, where we are told of the great solemnity accompanying this ceremony at the pyre of Menæacus and Archemorus, who were contemporary with Jair, the eighth judge of Israel. Homer abounds with funeral obsequies of this nature. In the interior regions of Asia the practice was of very ancient date, and its continuance long; for we are told that in the reign of Julian the king of Chionia burnt his son's body, and deposited the ashes in a silver urn. Coeval almost with the first instances of this kind in the East was the practice in the western parts of the world. The Heruli, the Getæ, and the Thracians, had all along observed it; and its antiquity was as great among the Celtæ, Sarmatiæ, and other neighbouring nations. This custom seems to have arisen out of friendship to the deceased, whose ashes were preserved, as we preserve a lock of hair, a ring, or a seal, which had been the property of a departed friend.

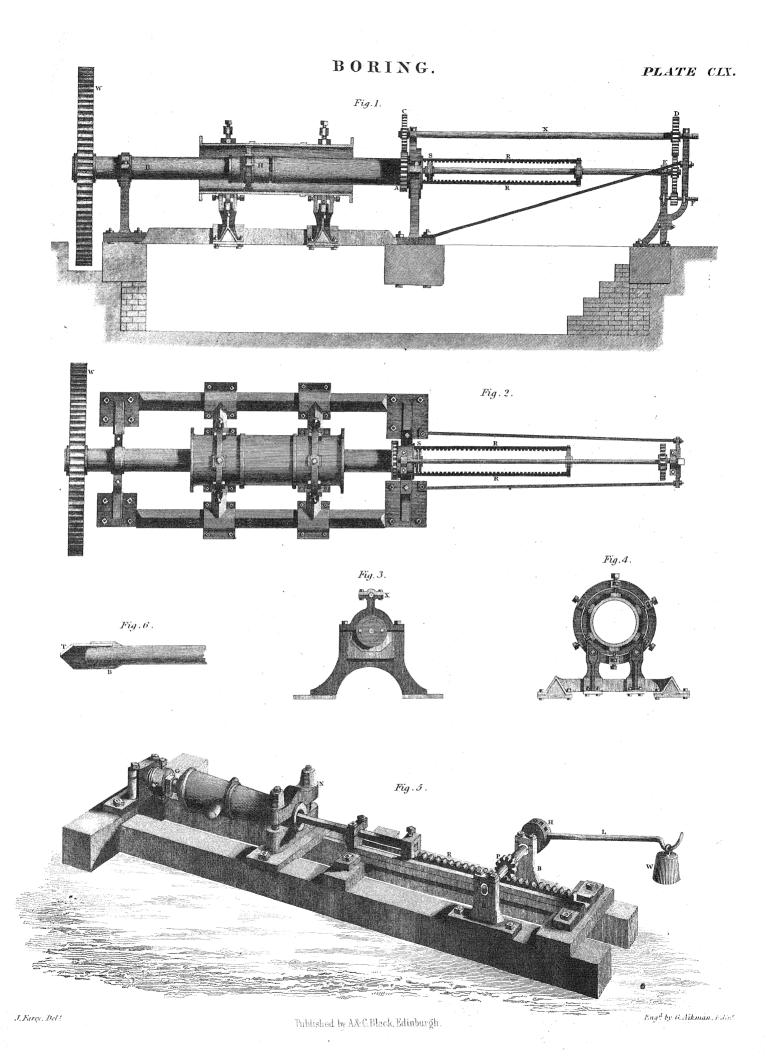

Kings were burnt in cloth made of the asbestos stone, that their ashes might be preserved pure from any mixture with the fuel and other matters thrown on the funeral pile. The same method is still observed with the princes of Tartary. Among the Greeks, the body was placed on the top of a pile, on which were thrown divers animals, and even slaves and captives, besides unguents and perfumes. In the funeral of Patroclus we find a number of sheep and

¹ See Diary, supra cit., vol. vi., pages 338-342.

Burning. oxen thrown in, then four horses, followed by two dogs, and lastly by twelve Trojan prisoners. The like is mentioned by Virgil in the funerals of his Trojans; where, besides oxen, swine, and all manner of cattle, we find eight youths condemned to the flames. The first thing was the fat of the beasts, wherewith the body was covered, that it might consume the faster; it being reckoned a great felicity to be quickly reduced to ashes. For the like reason, where numbers were to be burnt at the same time, care was taken to mix with them some of humid constitutions, and therefore more easily to be inflamed. Thus we are told by Plutarch and Macrobius, that for every ten men it was customary to put in one woman. Soldiers usually had their arms burnt with them. The garments worn by the living were also thrown on the pile, with other ornaments and presents; a piece of extravagance which the Athenians carried to so great a height, that some of their lawgivers were forced to restrain them, by severe penalties, from defrauding the living by their liberality to the dead. In some cases burning was expressly forbidden among the Romans, and even looked upon as the highest impiety. Thus, infants who died before teething were entombed unburnt in the ground, in a particular place set apart for this purpose. The same practice obtained in regard to persons struck dead with lightning. (See BIDENTAL.) Some say that burning was tice of burning the dead also denied to suicides. The manner of burning among end of the fourth century.

the Romans was not unlike that of the Greeks. The Burning. corpse, being brought out without the city, was carried directly to the place appointed for burning it; which, if it joined the sepulchre, was called bustum, if separate from it. ustrina, and there laid on the rogus or pyra, a pile of wood prepared for burning it, and built in the shape of an altar, but differing in height according to the quality of the deceased. The wood commonly used was that of such trees as contain most pitch or resin; and whatever kind was used, they split it, for the more easy catching fire; while round the pile were set cypress trees. The body, stretched on a couch or litter, was placed on the pile; and then the next of kin performed the ceremony of lighting the pile; which was done with a torch, the person turning his face away, as if it were performed with reluctance. During the ceremony, decursions and games were celebrated; after which came the ossilegium, or gathering of the bones and ashes; also washing, anointing, and depositing them in urns. the Romans borrowed the custom of cremation from the Greeks, it was not generally practised at Rome till towards the end of the republic. Sylla was the first of the noble family of the Gens Cornelia that was laid on the funeral pile; and this, it is said, was done to secure his corpse against indignities from his numerous enemies. The practice of burning the dead had fallen into disuse about the
